World Health Organization (WHO) declared the pandemic of swine influenza in the interest of large pharmaceutical companies. With such charges were made by scientists from several countries, who believe that the epidemics of pharmacists earn up to 7 billion euros. At the same time anywhere in the world death rate from swine flu has not exceeded deaths from seasonal flu, while the WHO insisted that the epidemic was declared by all the rules, writes "Kommersant".

The British newspaper Guardian Òhe and some European media have published the views of independent epidemiologists - Englishman Thomas Jefferson from the independent association of scientists Cochrane Collaboration and his colleagues from the United States William Engdahl, - accuse the WHO of inflating the risk of swine flu. Scientists believe that the WHO's lead expert associated with the pharmaceutical companies. According to Mr. Jefferson, a team of WHO experts, in particular the head of strategic advisory group on Influenza British Professor David Salisbury, "gets them a salary and working with them."

Independent experts believe that the panic over the virus A/H1N1 provoked expert WHO virologist from the Netherlands, Albert Ostenhaus, which has been in professional circles the nickname Dr. Influenza. Mr. Ostenhaus many occasions expressed deadly swine flu and urged European countries to mass vaccination.

According to independent scientists, such policies have led to the fact that the WHO in June this year, announced the upgrade of the threat of swine flu pandemic to the maximum, the sixth level in the interests of business structures, although the mortality rate from this disease did not exceed the death rate from normal seasonal influenza.

Politikere forargede over hemmeligt WHO-udvalg
Danish Members of Parliament Outraged by Secret WHO Committe

Information, 14 December 2009
https://www.information.dk/udland/2009/12/hemmelig-komite-raadgiver-who-svineinfluenza?lst_cntrb

Det er fuldstændig uacceptabelt, at WHO har et hemmeligt udvalg, som de facto træffer beslutninger om svineinfluenza, mener Dansk Folkeparti og den øvrige opposition. Sundhedsministeren vil gå ind i sagen af Kristian Villesen og Louise Voller Svineinfluenza »Fuldstændig uacceptabelt,« »helt vildt,« »meget utrygt,« »helt igennem grotesk,« og »meget mærkeligt«...

»Fuldstændig uacceptabelt,« »helt vildt,« »meget utrygt,« »helt igennem grotesk,« og »meget mærkeligt«. Sådan lyder reaktionerne fra henholdsvis Enhedslisten, Socialdemokraterne, Dansk Folkeparti, SF og sundhedsminister Jakob Axel Nielsen (K) efter at Information lørdag kunne fortælle, at der findes et hemmeligt udvalg i WHO, som rådgiver generaldirektøren om spørgsmål vedrørende svineinfluenza.

Helt centralt

Den hemmelige komité er helt central og står blandt andet bag beslutningen om at gøre svineinfluenzaen til en pandemi - en beslutning som medicinalvirksomhederne siden har tjent styrtende med penge på, fordi mange lande - herunder Danmark - har forpligtet sig til at købe vacciner af industrien i tilfælde af en pandemi. Derfor nytter det ikke noget, at der ikke er åbenhed om udvalgets sammensætning, mener Dansk Folkepartis sundhedsordfører Liselott Blixt:

»Vi går ind for gennemsigtighed. Man skal kunne se, hvad der sker mellem medicinalindustrien og beslutningstagerne. Industrien tjener tonsvis af penge på den her influenza, og derfor er det meget betænkeligt, at der i princippet kan sidde folk, der tænker mere på pengepungen end på, hvad der gavner offentligheden,« siger Liselott Blixt. Også Sundhedsminister Jakob Axel Nielsen finder strukturen problematisk:

»Det er et problem, at man ikke kan få at vide, hvem der sidder i udvalget. Jeg har ikke noget imod at faglighed og industri taler sammen. Vi skal bare vide det, og det gør vi ikke nu.«

Magt og tryghed

Enhedslistens Per Clausen understreger den magt, som udvalget har:

»Det her er et udvalg, som har været med til erklære pandemi og igangsætte et enormt salg af vaccine og Tamiflu. Enhver forbindelse, der måtte være til medicinalindustrien, skal naturligvis afdækkes,« siger Per Clausen. SF's Jonas Dahl mener, at det er utrygt for danskerne, at der ikke er gennemsigtighed:

»Vi skal have fuld tillid til de oplysninger, der kommer fra WHO. Derfor dur det ikke med et hemmeligt udvalg. At generaldirektøren tilsyneladende bare kan nedsætte sin egen lille private gruppe, som kommer med anbefalinger,« siger Jonas Dahl. Socialdemokraternes Sophie Hæstorp Andersen mener, at udvalget bryder med de gængse demokratiske spilleregler:

»Jeg kender ikke traditioner for offentlig forvaltning rundt om i verden. Men set i dansk sammenhæng, så er det her helt vildt,« siger hun.

Partiet Venstre er det eneste parti, som Information har talt med, der ikke kritiserer det hemmelige udvalg: »Det kan jeg ikke bare sådan uden videre forholde mig til - og slet ikke på baggrund af en avisartikel. Først skal vi have gravet et spadestik dybere, så vi kan se, hvad der er op og ned i den her sag,« siger Birgitte Josefsen (V).

Både Socialdemokraterne, SF og Enhedslisten vil stille spørgsmål om sagen til sundhedsministeren, der siger til Information, at han vil tage sagen op i WHO-regi: »Det her skal tages med, når vi skal evaluere hele forløbet omkring svineinfluenzaen,« siger Jakob Axel Nielsen.

Danish Members of Parliament Outraged by Secret WHO Committee
Politikere forargede over hemmeligt WHO-udvalg

Information, 14 December 2009
https://www.information.dk/indland/2009/12/politikere-forargede-hemmeligt-who-udvalg?lst_cntrb
https://web.archive.org/web/20100102050031/http://theflucase.com/index.php?option=com_content&view=article&id=2349%3Adanish-members-of-parliament-outraged-by-secret-who-committee-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

For WHO to have a secret committee that is the de facto decision-maker concerning the swine flu is totally unacceptable. That is the view of the Danish People's Party as well as the rest of the opposition parties. The Danish Minister of Health has said he will look into the case.

Written by Kristian Villesen, Louise Voller for the Danish daily newspaper Information.

"Completely unacceptable," "crazy," "very doubtful," "completely grotesque," and "very strange". These are the responses from The Unity List, the Social Democrats, the Danish People's Party, the Green Left and the conservative Minister of Health, Jakob Axel Nielsen, following the revelation that there is a secret committee inside the WHO, which advises the Director General on issues concerning the swine flu as published last Saturday by the Danish daily newspaper Information.

Right in the center

The secret committee plays a central role and the origin of the decision to declare the swine flu a pandemic – a decision which has generated tremendous financial gains for the pharmaceutical industry because many countries, among them Denmark, have signed contracts obliging them to buy vaccines from the industry in the event of a pandemic.

For that reason, transparency concerning the members of the committee is required, says Liselott Blixt, her party's spokesperson on health issues.

"We support transparency. You have to be able to see what happens between the pharmaceutical industry and the decision makers. The industry is earning an incredible amount of money on this flu. That is why it is very alarming that, in principle, the members may be people, who are more concerned with earning money than benefiting the public," says Liselott Blixt.

The minister of health, Jakob Axel Nielsen, agrees that the situation is problematic.

"It is a problem that there is no information about who the members of that committee are. I do not oppose the profession and industry talking together. We just have to know about it, and we don't right now."

Power and safety

Per Clausen from The Unity List underlines the power of the committee.

"This is a committee which has played an active role in the declaration of a pandemic and which has generated an enormous sale for vaccines and Tamiflu. Every connection to the pharmaceutical industry must be unveiled," says Per Clausen.

Jonas Dahl from Green Left finds the lack of transparency raises concerns for the Danish people.

"We must be able to have full confidence in the information coming from WHO. As a result, it is unacceptable for there to be a secret committee; that the Director General can apparentloy establish her own little private group to generate recommendations", says Jonas Dahl.

The Social Democrat Sophie Hæstorp Andersen thinks that the committee is violating established democratic rules.

"I don’t know the traditions for public administration in countries around the world. But seen in a Danish context this is far out," she says.

The political party Left is the only political party contacted by Information that does not critizise the secret committee.

"This is a matter I cannot relate to immediately – and particularly not on behalf of an article in a newspaper. First of all we have to dig a step further in order to make clear what is up and down in this matter," says Birgitte Josefsen.

Both the Social Democrats, Green Left and The Unity List are to ask the minister of health questions about the secret committee.

The minister himself, Jakob Axel Nielsen, told Information he would raise the issue with WHO.

"This will have to be taken into consideration, when we come to evaluate everything that has happened concerning the swine flu,says Jakob Axel Nielsen.

Advisers on Vaccines often have Conflicts, Report Says

The New York Times, 17 December 2009
https://www.nytimes.com/2009/12/18/health/policy/18cdc.html
https://web.archive.org/web/20120901150556/https://www.nytimes.com/2009/12/18/health/policy/18cdc.html

Washington - A new report finds that the Centers for Disease Control and Prevention did a poor job of screening medical experts for financial conflicts when it hired them to advise the agency on vaccine safety, officials said Thursday.

Most of the experts who served on advisory panels in 2007 to evaluate vaccines for flu and cervical cancer had potential conflicts that were never resolved, the report said. Some were legally barred from considering the issues but did so anyway.

In the report, expected to be released Friday, Daniel R. Levinson, the inspector general of the Department of Health and Human Services, found that the centers failed nearly every time to ensure that the experts adequately filled out forms confirming they were not being paid by companies with an interest in their decisions.

The report found that 64 percent of the advisers had potential conflicts of interest that were never identified or were left unresolved by the centers. Thirteen percent failed to have an appropriate conflicts form on file at the agency at all, which should have barred their participation in the meetings entirely, Mr. Levinson found. And 3 percent voted on matters that ethics officers had already barred them from considering.

The inspector general recommended that the centers do a far better job of screening. In a reply, the agency's new director, Dr. Thomas R. Frieden, agreed.

"Since the period covered in this review, C.D.C. has strengthened the financial disclosures and conflict-of-interest process by instituting improved business processes and realigning responsibilities and oversight," Dr. Frieden wrote.

As numerous medicines have been pulled from the market in recent years, worries have grown that experts may be recommending medical products – even ones they know to be unsafe in part because manufacturers are paying them.

As a result, government agencies, medical societies and medical journals have become increasingly insistent that experts disclose potential conflicts. And while the experts invariably insist that they have done so, government audits routinely find large gaps between these disclosures and the experts' actual income from consulting.

Congress tightened the rules on outside consulting after similar conflicts were found among members of advisory panels to the Food and Drug Administration. But little attention has been paid

to the potential conflicts of advisers to the C.D.C., even though that agency's committees have significant influence over what vaccines are sold in the United States, what tests are performed to detect cancer and how coal miners are protected.

Most of the advisers identified by Mr. Levinson had either a job or a grant from a company or other entity whose interests were affected by the committees' discussions, and a considerable number also owned stock in such companies, the report said.

Representative Rosa DeLauro, a Connecticut Democrat who said she had long been a supporter of the C.D.C., said: "That is why I am so concerned about this report issued by the inspector general exposing serious ethics violations within the C.D.C. All members of the federal advisory committees, whose recommendations direct federal policy, should be without conflict of interest."

Medical News TODAY

Experts on Vaccine Advisory Panels had Conflicts, CDC Report Says

Medical News, 21 Dec 2009, 0:00 PST
https://web.archive.org/web/20100114195725/http://www.medicalnewstoday.com/articles/174539.php

Sixty-four percent of the advisers hired by the Centers for Disease Control and Prevention in 2007 to serve on panels evaluating cervical cancer and flu vaccines had potential conflicts of interest that were unresolved or were not identified by the agency, according to a new report by HHS Inspector General Daniel Levinson, the New York Times reports. The report, expected to be released Friday, faults CDC for failing to ensure that nearly all of the experts adequately completed forms pertaining to their financial ties to companies that could profit from CDC decisions.

Levinson found that 13% of the advisers did not have an appropriate conflicts form on file with CDC, which should have disqualified them from participating in the meetings. Three percent of the advisers voted on issues that ethics officers had already prohibited them from considering, according to the report. Most of the advisers Levinson identified either had a job or received a grant from a company or entity that would be affected by the panels' decisions. Many of the advisers also owned stock in these companies, the report found.

Levinson said CDC needed to improve its screening efforts to prevent conflicts of interest. CDC Director Thomas Frieden said, "Since the period covered in this review, CDC has strengthened the financial disclosures and conflict-of-interest process by instituting improved business processes and realigning responsibilities and oversight" (Harris, New York Times, 12/18).

Paul Waldie, Grant Robertson

How vaccines became big business

The Globe and Mail, 29 December 2009
https://www.theglobeandmail.com/life/health-and-fitness/health/conditions/how-vaccines-became-big-business/article572731/

It was not the talk Dr. Michael Ossi planned to give when he was summoned to Washington in the fall of 2003 to brief health officials on Capitol Hill.

Dr. Ossi, an infectious disease expert with British pharmaceutical giant GlaxoSmithKline PLC, had been asked to meet with government officials on how to respond to a deadly problem unfolding halfway around the world.

In Asia, entire flocks of birds were dying from a virus called H5N1, better known as avian flu. A particularly virulent strain of influenza, H5N1 had for years been confined mostly to birds because their higher body temperatures provided an ideal environment for the bug to proliferate.

But pockets of people were becoming infected in Asia, setting off alarm bells for health officials around the globe. When it spread among humans, the consequences were unusually fatal. Roughly 60 per cent of those infected with H5N1 died, making it three times deadlier than the 1919 Spanish Flu, according to the World Health Organization.

Dr. Ossi came to the hastily arranged gathering of health officials and academics expecting to talk to them about his company's research into anti-viral drugs and flu vaccine. But the health experts clustered around a handful of tables were not interested in hearing about the science behind such products. They had much more pressing concerns.

They only had one question, Dr. Ossi recalls: "*How much can you make and how fast can you make it*?"

It was a watershed moment for him. For most of his career, working in vaccine research - indeed, most research related to the prevention and treatment of infectious diseases - was a ticket to obscurity at a big drug company. The high stakes and big profits for companies like Glaxo were not in vaccines, but in multibillion-dollar blockbuster drugs: the Wellbutrins, the Zantacs and the Valtrexes.

But the world was changing. Shoehorned into that meeting room in Washington were mathematicians from top universities, charged with calculating how many people could be protected in a pandemic; ethicists who would debate who should get medicine first in the event of a shortage; and public health officials struggling to find a way to cope with potentially tens of millions of infected people. Their urgency made it clear to Dr. Ossi that the quiet, unprofitable world of vaccines was about to be given more prominence in government than it had in decades.

H5N1 would alter government approaches to pandemic planning. But it would also create a new and unprecedented opportunity for the global pharmaceutical industry. It was, as Dr. Ossi recalls, "an obvious commercial opportunity" for the drug companies - one that is reshaping their businesses.

In a matter of a few years, flu shots have gone from being a marginal, money-losing business to a massive profit generator for a small number of global companies, as governments and the public hasten to protect themselves from getting sick.

Between 2004 and 2007, vaccine sales across the industry soared an average of 32 per cent each year, with flu vaccine leading the way. That is roughly four times faster than any other pharmaceutical product.

In a year that will be remembered for widespread public worry about the H1N1 virus, or swine flu, vaccines have become a $24-billion business. Analysts predict the global vaccine industry will top $40-billion by 2012. For companies like Glaxo, Sanofi-Aventis, Merck & Co., Novartis AG and Pfizer Inc., the fear of a pandemic has translated into a financial windfall that has been years in the making. Worldwide, nearly 1 billion doses of H1N1 vaccine have been ordered in 2009.

This is the story of how that happened - how Flu Inc. grew out of nowhere, transforming a once struggling business characterized by lab closures and lawsuits into a high-profit industry in less than a decade, and of the steps the pharmaceutical industry has taken to ensure the dollars keep flowing.

The change is driven by a new way of thinking in government about how to approach future threats of a flu pandemic. Health officials have begun to see merit in pursuing a strategy of stockpiling vaccines, even at a much higher cost per dose than they paid in the past.

Behind all this, of course, is a public that demands to be protected from the worst strains of influenza. This year, about 40 per cent of Canadians got the vaccine for H1N1 - the highest adoption of a flu shot the country has ever seen. Those shots are responsible for limiting the spread of the disease and, most likely, for saving lives. But even as the H1N1 threat subsides after killing more than 400 people in Canada, the business of fighting flu is arguably still in the early years of its growth.

"It was *a new market, created by this pandemic scare*," Dr. Ossi said.

How the flu vaccine industry was built

Vaccines have always been a business. They've just never been a very good business.

"We were losing money," said Claude Vezeau, former chief executive officer at Montreal-based IAF BioChem International, Canada's largest maker of vaccines in the 1990s. "All vaccines were losing money."

The problem has been rooted in the cumbersome process of vaccine production and in the public's complacency. Alan Davies, the head of Canada's famed Connaught Antitoxin Laboratory at the University of Toronto, once lamented: "People are willing to pay more for a bottle of headache tablets than they are for a vaccine that will protect them for many years." Connaught, too, was a money-loser.

The idea of inoculating people against disease dates back to 1796 when British doctor Edward Jenner noticed that milkmaids appeared to be immune to smallpox because of their exposure to a mild form of pox carried by cows.

Dr. Jenner took puss from a lesion on the hand of a milkmaid and inoculated a young boy. When the child didn't become ill with smallpox, Dr. Jenner deduced that a small dose of a disease could protect a person from a more serious illness (the word vaccine is derived partly from "vaca," the Latin word for cow).

More than two centuries later, making vaccines on a large scale remains challenging. Vaccines are still made primarily from tiny bits of pathogens, the disease-causing agents of a virus. It can take months to get the formula right, and flu viruses are always changing. The manufacturing process is also clunky and relies on techniques developed 50 years ago in which a virus is injected into chicken eggs to multiply.

Here's how the process works: Like any virus, flu will only grow in living cells. One of the best places to grow it is in fertilized chicken eggs. (Pigs and humans are also good, but less practical.) Eleven days after the egg is fertilized, a hole is drilled into the eggshell and the virus is injected into the fluid surrounding the embryo. After the virus infects the embryo, it multiplies. Machines then crack open the eggs and the virus-filled fluid is removed.

The virus is chemically inactivated, usually with formaldehyde, and used as the "antigen" of a flu shot. Antigen is short for antibody generator. When injected into the body, it's the antigen that provokes an immune response that remembers the code of the virus that is attacking the body.

The antigen-making process can take months because the eggs have to be at the right maturity. The virus also grows slowly and it can take as many as three eggs to make one shot of flu vaccine. Then there are the chickens that produce the eggs - they have to be kept in steady supply, and healthy, since producing enough vaccine for an entire country can take millions of eggs.
"It's very cumbersome to make flu vaccine," Dr. Ossi said.

Heavy regulation and a lack of a broad customer base - governments are the primary buyers - left many drug companies with little incentive to make vaccines. Why spend time on such a low-margin business as vaccines when a company could make a fortune developing a new blockbuster drug?

In Canada, where vaccine making was once largely left to public institutions, the picture was no brighter. The country's largest facility, the Connaught lab, earned fame as the site of Frederick Banting and Charles Best's insulin discovery. But it struggled financially for years before being bought by French drug giant Sanofi-Aventis.

Canada's other large vaccine facility, the Institute Armand-Frappier in Quebec City, didn't fare much better. By the mid 1980s, its owner, the University of Quebec, could no longer shoulder the financial burden, and the facility was sold to Mr. Vezeau's IAF BioChem - which also struggled.

How the world changed for vaccines

But all of that began to change with the first hint of a pandemic on the other side of the world.

The outbreak of H5N1 in Hong Kong in 1997 was relatively small - just 18 people who handled birds - but six of them died. Such a high death rate drew immediate attention from medical experts around the world. Fears of a much bigger death toll began to percolate at government levels.

Like many countries, Canada began working on a pandemic preparedness plan. Led by John Spika, a senior infectious disease official at Health Canada, federal and provincial bureaucrats began drawing up models of a potential outbreak that could kill up to 58,000 Canadians and do $30-billion worth of damage to the economy. The key to fighting such an outbreak, they believed, was securing an abundant supply of vaccine.

Dr. Spika and others in the vaccine community warned that if a serious pandemic broke out, countries would close their borders and hoard vaccine. Governments began setting aside money in federal budgets for pandemic preparations. Ottawa also began negotiating a long-term vaccine supply agreement with BioChem, which had the only flu vaccine facility in Canada.

For Mr. Vezeau at BioChem, *pandemic planning was a godsend*. Suddenly, he had the attention of government officials. "We were losing money, so we went to the government and said, 'Listen, for this to be a viable manufacturer, we need to increase the price of our vaccine," Mr. Vezeau said. They got a higher price.

The government pursued contract negotiations with BioChem on a deal that was potentially so lucrative it began to push the value of the company higher. Before it was even signed, Shire Biologics stepped in and purchased BioChem in 2001. Soon after, *the company signed a 10-year pact with Ottawa* that would see the Quebec facility responsible for producing flu shots for every Canadian in a pandemic.

Dr. Spika called the deal "a cheap insurance policy" for the country. At a price tag of $300-million, it was more money than the vaccine maker had ever seen before.

Other vaccine companies began to negotiate similar large-scale contracts in dozens of countries, from Switzerland to France and even such smaller nations as Iceland.

However, one problem remained for the vaccine manufacturers as governments around the world began doling out money for contracts. The process was slow and hard to use on a mass scale. "They have to use chicken embryos and there isn't enough supply of those readily available to be able to make tons of vaccine," Dr. Ossi said.

Fighting pandemic flu with vaccine made from eggs alone would be a losing battle, many believed. Companies needed to find a way to increase the amount of vaccine that could be produced in order to capitalize on the growth. And that particular discovery was already in the works.

The problem with making vaccines

For years, scientists had tried to find a faster way to make vaccines. They chased a variety of theories, including isolating the DNA of a virus, which many researchers believed would unlock new ways to fight infections. But at its main vaccine facility in Rixensart, Belgium, Glaxo had found a way to make vaccines more potent using another kind of technology: adjuvants.

Adjuvants are like superchargers for vaccines. They are mild contaminants that cause the body to respond with a more intense immune response. When paired with antigens, the adjuvant liquid can make the vaccine's impact stronger. This allows for more doses to be produced from less antigen.

The word itself comes from the Latin "adjuvare" which means to help or aid. But adjuvants, like so many scientific discoveries, were stumbled upon almost by accident.

Testing on different batches of vaccines often found that some worked better than others. In cases where there was a slight contaminant present in the mix - something as simple as using dirty lab materials - researchers found there was an enhanced immune response from the body to that dose of vaccine.

Thus the adjuvant industry was born, with contaminants such as oils, salts and virosomes (which are bits of influenza virus that do not replicate) added to vaccines. – "It allows us to decrease the antigen content, which allows us to multiply the capacity," said Philippe Monteyne, senior vice-president of global vaccines development at Glaxo. "And of course, multiplying the capacity has some impacts on the business side," boosting profits.

Adjuvants allowed companies to pump out more, but it is also a higher-margin business than antigens. Significantly more than half the price of a dose of flu vaccine is attributable to the adjuvant, though Glaxo doesn't disclose the exact figures. "That's why vaccines became so attractive," Mr. Monteyne said. "Most of the value in our case is put on the adjuvant technology."

For the drug companies, the new interest in vaccines by governments looking to get as many flu shots as they could buy, and the scientific advances of adjuvants, came at an opportune time.

Many drug makers were starting to worry about the long-term viability of megadrugs like Lipitor, a cholesterol fighter, and Zantac, an ulcer treatment, that have a finite period of patent protection. When the patents expire, the market is flooded with cheaper generic versions. The big drug companies needed a new source of revenue, and the advent of large-scale vaccine manufacturing looked promising.

With the value of vaccines on the rise with the fears of avian flu, the drug companies also liked something else about the resurgent business: they had it to themselves.

Because vaccine making is so expensive - a new plant can cost up to $1-billion (U.S.) - companies like Glaxo, Novartis and Sanofi-Aventis didn't have to worry about a rash of new entrants cutting into the flu vaccine business as governments ordered millions of doses.

For the drug companies, the new interest in vaccines by governments looking to get as many flu shots as they could buy, and the scientific advances of adjuvants, came at an opportune time.

"The barriers to enter the market are extremely high," said Mr. Monteyne in Belgium. "You don't become a vaccine maker over night. That's why we have a few big players, and very few only." That meant the giants could push hard to increase prices. And they did.

Sanofi-Aventis expects to earn close to $6-billion (U.S.) in vaccine revenue next year and double its sales by 2013. This quarter, sales of H1N1 vaccine alone will top $500-million. It is suddenly a good time to be a flu shot maker. – "Vaccines, vaccines, wonderful business," Chris Viehbacher, the Canadian-born CEO of Sanofi-Aventis, told investment analysts on a conference call a few months ago.

It didn't take long for such calculations to be made in other boardrooms around the globe. The companies began acting quickly to expand: Novartis spent $5-billion to buy U.S.-based flu vaccine maker Chrion. Britain's Astra Zeneca paid $15-billion for Medimmune, and Glaxo purchased the old BioChem vaccine operation in Quebec for $1.4-billion.

With 22 per cent of the market, Glaxo was now the global leader in vaccines. And with that clout came the power to influence governments, who were already fearful about not having enough vaccine supply in the event of a pandemic.

How vaccines are sold and prices are set

In the summer of 2008, Canadian Finance Minister Jim Flaherty's staff prepared a briefing note for an upcoming meeting with the head of Glaxo's Canadian operations, Paul Lucas.

Glaxo had been lobbying several governments around the world to get higher vaccine prices and access to massive cash reserves countries were setting aside to cope with a pandemic threat. – "We understand that Mr. Lucas would like to discuss how GSK could further contribute to Canada's pandemic preparedness, including [Ottawa]setting aside $400-million as a contingency fund," the note said, according to documents obtained by Ottawa researcher Ken Rubin.

Mr. Flaherty held the purse strings on any national pandemic plan and subsequent vaccine purchase from Glaxo. The company had a message for the minister: "GSK has been critical … contending that the proposed vaccine price is too low," Mr. Flaherty's staff told him.

Indeed, the company had already been lobbying governments well before then. Since the late 1990s, prices for flu vaccine in North America have soared from $2 per dose to as high as $12 in 2007. The price has recently fallen back to about $8 as buying volumes increased in the face of H1N1. But that's still a healthy margin, as some analysts estimate it costs about $1 to make each dose.

The company does not discuss its costs, but Mr. Monteyne said the cost of a flu shot is flexible depending on whether the buyer can pay more. "We have a tiered pricing strategy," Mr. Monteyne said. "It is mainly based on the level of income of the country."

Beyond just selling crates of vaccine, Glaxo also wants to sell full-service protection - pandemic readiness packages. And the industry's desire to build a stable business out of vaccines, along with the emergence of adjuvants, has led to perhaps the most significant shift the industry has seen in decades: the creation of vaccine stockpiles.

Switzerland was the first country to jump in. In October, 2006, with fear over H5N1 at fever pitch, the Swiss signed a contract with Glaxo on a stockpiling deal that called for 8 million doses of avian flu vaccine, slightly more than one shot for every citizen.

Then, in a new kind of move for the industry, the Swiss reserved future space on the production line for another 8 million doses if needed. That meant Swiss health authorities had priority in line at Glaxo's factories if a second dose were needed.

This emerging business – pre-pandemic treatment – was rounding into shape. Glaxo began trade-marking the names of vaccines along those lines, registering its vaccines as Prepandrix.

Other nations soon followed the Swiss with deals of their own, locking up huge sales for Glaxo.

There was just one problem: the H5N1 pandemic never happened. The virus stayed mostly with animals. The Swiss were left with one of the world's largest stockpiles of unused H5N1 flu vaccine. Glaxo's sales of avian flu vaccine fell 54 per cent in 2008, as countries realized their stockpiles weren't needed.

This was a problem for the vaccine makers, who were looking to build an enduring revenue stream rather than simply capitalizing on flu fears to gain a temporary spike in sales. Glaxo's new CEO, who had been elevated from the ranks of the company's vaccine division, understood this.

How the new vaccine market was born

Barely a year into his tenure as Glaxo's chief executive officer, Andrew Witty outlined the company's achievements during a conference call in October. Quarterly profit was up 30 per cent from a year earlier, orders for H1N1 flu vaccines had topped 400 million doses and the company was close to becoming the world's largest vaccine maker. – "I think the momentum of this business is going in the right direction," Mr. Witty told analysts. In short, Glaxo's big bet on vaccines was bearing fruit. And perhaps most surprisingly, the Swiss were buying again, despite having spent millions on H5N1 vaccine it never used.

This, ***Mr. Witty explained***, was the brilliance of the new vaccine market. Glaxo had turned the Swiss situation into an opportunity to sell more vaccine.

Because adjuvant could be paired with any antigen, the leftover stockpiles could be used for other outbreaks by simply plugging in a different antigen, depending on which virus looked most threatening.

Once a country bought a large supply of adjuvant, it was locked in as a buyer for Glaxo's antigen for years to come. Countries were not just vaccine buyers now; they were subscribers, coming back annually to the company for more and different types of shots. – "If you go with an adjuvanted technology, you can actually keep a stockpile of your adjuvant and then simply rotate a new antigen in at the last minute," Mr. Witty said.

That is basically what the leading countries like Switzerland did.

"The real business is a business of stockpiling. It is not a reactive market. It is something that is proactively being built with governments," Mr. Monteyne said.

Other countries, including Canada, took notice of what the Swiss were doing. In the past 12 months, the number of countries using such stockpiling methods has grown to 60 from less than 10. When H1N1 broke out and temporary vaccine shortages occurred, Canadians learned that the federal government has become a big buyer of adjuvants.

As far as the vaccine makers are concerned, adjuvants are the future because they encourage countries to stockpile what they've bought from the drug companies. Asked by an analyst whether the company could keep generating the record vaccine profits it saw in 2009, Mr. Witty didn't hesitate: Yes, it could.

"What's been created this summer is essentially a stockpiling marketplace, which over a period of time will have to be refreshed," Mr. Witty told analysts. "And that's exactly where we see there being some kind of steady state" for the vaccine industry.

New fears over H1N1 were the catalyst to a completely new way of buying and selling vaccines that many countries are expected to follow. Flu shots are now a product for the masses. Non-seasonal flu shots such as H1N1 could become a yearly norm.

Soaring vaccine sales are also pushing companies to chase profit in other types of shots. The race is now on to develop blockbuster vaccines, defined as those that bring in more than $1-billion annually. Two recently developed vaccines - Prevnar for pneumonia and Garasil for cervical cancer - have become blockbusters, selling close to $2-billion a year.

For now, though, the flu is the driver of all of this.

Flu Inc. is fed by the worry of the unknown, the fears of government that the next pandemic lies just around the corner, or tucked away in some far off area of the world. In the case of H1N1, the

threat of illness for 40 per cent of the country was real enough that they went for the shot, sometimes lining up for hours to get it. And that has spawned a new business.

"We are just at the early days of a new era which is just exploding," Mr. Monteyne said. "The whole vaccine industry is changing."

Dr. Ossi sees it as a permanent shift in habits. "The volume of vaccine that countries are asking for has gone up exponentially," he said.

"How many people got flu shots five years ago? Even the very high-risk people out there - the elderly, with chronic lung disease - only 60 per cent of those were vaccinated. Otherwise, many healthy people never thought of getting the flu vaccine.

"Now, all of a sudden, there's a huge demand and a lot of people are jumping on the bandwagon. It's something that will continue for good now. It's a new marketplace."

STAN

Pandemi-Sammanfattning

STAN, 6 januari 2010.
https://fritenk.wordpress.com/2010/01/06/pandemi-sammanfattning/

Dan Jönsson gör en bra sammanfattning av svininfluensa-affären:
”Hanteringen av svininfluensan har skapat en förtroendekris som drabbar inte bara WHO, utan hela FN-systemet. Samtidigt som klimatkaoset i Köpenhamn demonstrerat FN:s handlingsförlamning visar det sig återigen att när den verkligen betyder något har världsorganisationen alltför lätt att böja sig för mäktiga intressen – om de nu är nationella eller kommersiella, ekonomiska eller militära. Pandemiskandalen och klimatfiaskot gör tydligt att vad världen behöver är ett FN som kan vara en motvikt till dessa intressen, i stället för som nu: deras förlängda arm. En lagom utopi för tiotalet, kanske?”

Han citerar också Wolfgang Wodarg som kallar denna sk pandemi,*”En av vår tids största medicinska skandaler”*. Wodarg är tysk parlamentariker och epidemiolog och ordföranden för Europarådets hälsokommitté, en av dessa hjältar som står upp mot galenskapen. Han säger så här i en dansk tidning – information.dk: ”*Vi har haft en mild influensa – och en falsk pandemi”*. Wodarg har tagit upp saken i Europarådet. I januari ska man hålla en debatt om läkemedelsindustrins inflytande över WHO, 47 parlament i Europa ska informeras. Därefter börjar en undersökning och utfrågningar av de ansvariga för pandemiberedskapen. => Voller L, Villesen K. 'H1N1-Pandemien er en af århundredets største medicinalskandaler'. – Information, 28 December 2009
https://www.information.dk/udland/2009/12/h1n1-pandemien-aarhundredets-stoerste-medicinalskandaler

Inga läkemedelsbolagsintressen bör ha inflytande över pandemiberedskapen. I Ryssland har en parlamentariker föreslagit en bojkott av WHO, om det inte sker en ändring mot ökad transparens, vad säger du om det? *”Alla med kunskap i epidemiologi bör ha ställt sig frågande till WHO’s agerande från första början.”*

Vem ska se till att vi har teknisk kunskap om vacciner om inte industrin får deltaga? *”Det ska oavhängiga institut, som kontrolleras av medlemsländernas parlament, och som har full öppenhet så att offentligheten har insyn.”*

Är det realistiskt att avlägsna läkemedelsbolagen helt från WHO’s styrande? *”Nej, och därför måste vi ha transparens. Dessutom ska de inte delta när beslut tas om när pandemi ska deklareras, eller om vilka som ska vaccineras. De ska bara svara på hur snabbt de kan få fram vaccin. Och bara när de blir tillfrågade,”* säger Wolfgang Wodarg.

WHO ska ge 180 miljoner doser vaccin till länder i tredje världen, som de fått från medlemsländernas överskottslager. Vad tycker du om det? *”Jag tycker att det är helt meningslöst, och om vi inte har en ordentlig koll på de otestade tillsatserna, kan de göra mer skada än nytta.”*

Reaktioner mot pandemi-affären från fler håll:
– Italy: the new influenza is a bluff?
– Swiss Green Party Asks Government For Pandemic Information
– Danish Members of Parliament Outraged by Secret WHO Committee Frankrike:

"The mass swine flu vaccination campaign has galvanised France and led to the create of a new alternative or independent networks on the internet as people have become increasingly aware that the government and the mainstream and government-controlled media are not giving adequate information."

– Kanada: The WHO should just give up on the flu scare:

Every year in this country, 2,000 to 8,000 people die of flu, according to Health Canada. Swine flu, conversely, in the almost eight months since the outbreak began, has killed merely 138. Worldwide, WHO figures show fewer swine flu deaths in eight months than seasonal flu deaths every two weeks.
The WHO has been dishonest about swine flu from the very beginning. It's used its phony pandemic to cover up its five-year scarefest over an avian flu pandemic that never came, to feed at the trough of greater power and a fatter budget, and even to call for redistribution of international wealth on the basis of values "like community, solidarity, equity and social justice," in the words of its director.

***

Hur stor skada gjorde vaccineringarna? Det är en av skandalerna i detta, det vet man inte. Det tycks ha förekommit ett intensivt undertryckande av dödsfall och biverkningar. De första dagarna när vaccineringarna började på allvar i mitten av oktober rapporterades i stort sett ett fall om dan in om någon som dött inom några dagar efter vaccineringen. Sen verkar det som att order gavs om att begränsa rapporteringarna om biverkningar i media! Läkemedelsverket har kommit med redovisning om inrapporterade fall men bara fram till 4 dec. Då hade man 18 dödsfall. Men man förnekar ju på ett nästan komiskt sätt alltid att allvarliga biverkningar kan ha orsakats av vaccinet. Ska jag göra en gissning utifrån det jag sett på nätet, i kommentarer till artiklar och på bloggar, om dödsfall på t.ex. äldreboende där två personer avlidit på natten efter vaccineringarna och order getts om att hålla tyst om det och liknande, så gissar jag att kanske 50-talet personer dött. Johan Niklasson på theflucase.com trodde att kanske 150 dött och flera hundra fått missfall!

Gjorde vaccinerna någon nytta? Experter som Tom Jefferson som studerat den dåliga forskning som finns om influensavacciners effekt menar att de knappast har någon positiv effekt att tala om. När man satte igång att spruta var influensaläget mycket lugnt, sen presenterades en bild av att antalet smittade var stort just som vaccinerandet var igång som mest. Det säkraste sättet att bli sjuk verkar ha varit att ta sprutan, en stor del verkar ha blivit rejält sjuka i flera dagar. Det skulle inte förvåna mig om dessa räknats in i statistiken över influensasjuka i de uppskattningsmetoder man använder. Moral och renhårighet har i alla fall visat vara i stort sett obefintlig från myndigheters och mediers sida under den här kampanjen. 25 fall av döda i svininfluensan har smittskyddsinstitutet, men lika mycket som man tonar ner skador av vaccinet lika mycket överdriver man svininfluensans farlighet. De allra flesta av de som dött har haft annan allvarlig sjukdom och hade troligen dött som följd av vilken influensa som helst. 1000- 2000 personer dör ett vanligt år i sviterna av influensa. När sen influensafallen plötsligt minskade drastiskt i december så gjorde de så i andra länder också, som i Tyskland där 3-4% tagit sprutan, inte 40- 50% som här.

Var "svininfluensaviruset" skapat i laboratorium och utsläppt med flit? Experter har bedömt att det mest sannolika är att denna kombination av olika virussorter har kommit till i laboratorium. Hur det sen kommit ut är kanske inte så lätt att bevisa.

Men det som gjorde vaccinaffären så dramatisk var ju farhågorna att detta var "The Big One". Den sedan flera år planerade stora offensiven som skulle döda många miljoner människor. Fanns det anledning att misstänka att en drive satts i verket för att reducera jordens befolkning? Att en verkligt dödlig smitta skulle spridas med vaccinerna? Med tanke på alla opåkallade förberedelser och varningar för en dödlig pandemi som skulle döda miljontals människor, planer för massgravar och interneringsläger, uppgifter om att den dolda makten i många år talat om problemet med för stor

befolkning på jorden och om vacciner som ett sätt att ändra på det, så fanns det nog det. Och inte minst det faktum att det av vad som verkar vara en tillfällighet avslöjades, ca tre månader innan svininfluensautbrottet i Mexiko i april, att vaccintillverkningsföretaget Baxter skickat ut stora mängder vaccinmaterial till flera laboratorier i Europa som var blandat med det farliga fågelinfluensaviruset! Att denna praktskandal tystades ner och inte nämndes i mainstreammedia förstärkte bara bilden av att något inte stod rätt till. Man kan få för sig att en avsiktlig spridning av en dödlig smitta som kunnat döda miljontals hade turligt stoppats. Om man sen lägger till nästa pusselbit, WHO ändrade i sin definition av vad som räknas som pandemi i maj! Blev man oroliga att viruset inte var tillräckligt dödligt för att man skulle kunna utlysa pandemiläge 6 så att hela vaccinmaskinen kunde sättas igång?

Som det ser ut nu infriades som tur är inte de värsta farhågorna. Kan planerna ha ändrats bakom kulisserna när man märkte hur stor misstänksamheten och motståndet mot vaccineringarna var? Det finns många frågetecken, vad var det som hände i Ukraina? Har den mycket dödliga smittan stoppats? Eller var det fall av TBC, som är ganska vanlig där, och som kan ha fått större genomslag pga IMF's krav på nedskärningar av grundläggande service till medborgarna?

Tänk allt överblivet miljöfarligt vaccin som innehåller bl.a. kvicksilver som nu finns, många miljoner doser.

För att få lite perspektiv på den otroliga insatsen med den här pandemin, jämför med att 16 000 barn dör varje dag! av orsaker som hade kunnat åtgärdas. Och den förföljelse människor som kommit på bot för cancer och andra sjukdomar utsätts för.

Interview: Reconnaître et comprendre les conflits d'intérêts

Roland Simion, 6 janvier 2010
https://web.archive.org/web/20100121020903/http://www.rolandsimion.org/spip.php?article108

Sur la question des conflits d'intérêts comme sur bien d'autres, il existe un décalage faramineux entre la conscience qu'en a désormais le public et la désinvolture persistante des grands médias (et de l'administration), comme illustré par les deux exemples suivants:

L'art. L.4113-13 du Code de la santé publique (qui fait obligation à tout professionnel de santé s'exprimant dans les médias de déclarer ses liens d'intérêts) est constamment ignoré (cf. Vaccination antigrippale: les perles de la campagne...) Il correspond pourtant à une exigence de vérification des sources qu'on voudrait croire systématique chez les journalistes (défense de rire...)

Au centre d'un scandale désormais mondial, le Dr Osterhaus reste obstinément présenté comme «digne de confiance» par Le Monde diplomatique (cf. Le Monde diplomatique), journal pourtant peu suspect d'être à la solde du lobby pharmaceutique.

A entendre les dénégations des experts pris la main dans le sac de la dissimulation, on a l'impression que s'ils n'ont pas utilisé de versements occultes pour s'adonner au jeu, à la drogue ou au sexe, rien ne saurait leur être reproché. La réalité des liens d'intérêts est bien plus subtile et profuse.

Dans la même inspiration que celle qui a guidé mon livre ("Alertes grippales"), je souhaite, dans cette interview, proposer aux citoyens une grille conceptuelle et des éléments de fait qui leur permettront d'ancrer dans leur juste indignation une réflexion authentiquement politique - et d'en tirer, pourquoi pas, une volonté d'agir dans la Cité.

WHO Scientists Corruption Scandals Appear Endemic

Financial Sense Editorials, 11 January 2010
https://web.archive.org/web/20100329212655/http://www.financialsense.com/editorials/engdahl/2010/0111.html

The much-touted threat of an H1N1 Pandemic flu fades in the mildest flu season on record, and governments are left sitting on millions of dollars of stocks of vaccines. The Parliamentary Assembly of the Council of Europe will begin an official investigation into evidence of scandalous corruption relationships in the new "Golden Triangle" of the global drugs industry – WHO, its scientific academic 'advisors' of SAGE, and the pharma drugs industry, yet new confirmations of the extent of official corruption are emerging.

Further information of official WHO corruption has emerged as people begin to look more closely at the unelected officials wielding so much power over our health.

According to WHO's official declaration on conflicts of interest, its official scientific advisory body, the Strategic Advisory Group of Experts on Immunization (SAGE), are obliged to inform on all kinds of financial research support, scholarships, payment for collaboration and sponsor support for the research unit, during the past three years.

Now despite a WHO pledge of transparency in publishing the ties of its members or advisors to the pharma industry, a Danish Freedom of Information Act request by Louise Voller & Kristian Villesen for the Danish daily newspaper *Information* has confirmed that the newest member of the elite SAGE, Finnish Professor Juhani Eskola, an advisor managed not to reveal the fact that his Finnish research laboratory, THL, a WHO research center, got 6.3 million Euros (about $9 million) from swine flu vaccine maker, GlaxoSmithKline (GSK) in 2009. GSK produces the H1N1 swine flu vaccine, 'Pandemix' which the Finnish and many other governments, following the recommendations of THL and WHO, purchased in large volumes as a national pandemic reserve.[1]

The Finnish Minister of Health has become involved in the Eskola case and has asked for transparency concerning the researcher's financial ties to the pharmaceutical industry. However, Professor Eskola doesn't agree that there is a problem. He secures and protects his 'WHO' status, by offering a minor 'consultative payment' to the pharmaceutical company, Novartis.

The GSK money is the THL lab's largest income source. Questioned about the obvious conflict of interest in the appointment of Eskola to "objectively" advise WHO on vaccines, Eskola admits, "We are aware that there appears to be a conflict interest."

'Mr Flu' and the stench of corruption

Eskola is part of a much more pervasive corruption in the scientific advisors of WHO. The scientist perhaps most influential in the vaccine decisions of WHO since the outbreak of SARS in Asia and Avian Flu several years ago is Holland's Professor Albert Osterhaus. Known as 'Mr Flu' for his enormous influence over WHO and other flu decisions, Osterhaus lost his shine recently when the Dutch Parliament was forced to investigate Osterhaus' ties to the pharma industry.

Osterhaus, of the Erasmus University in Rotterdam Holland has been named by Dutch media researchers as the person at the center of the worldwide Swine Flu H1N1 Influenza A 2009 pandemic hysteria. Not only is Osterhaus the connecting person in an international network that has been described as the Pharma Mafia, he is THE key advisor to WHO on influenza and is intimately positioned to personally profit from the billions of euros in vaccines allegedly aimed at H1N1.

Osterhaus's credentials and expertise in his field were not in question. What is in question, according to a short report published by the journal *Science*, are his links to corporate interests that stand to potentially profit from the swine flu pandemic. *Science* carried the following brief note in its October 16 2009 issue about Osterhaus:

"*For the past 6 months, one could barely switch on the television in the Netherlands without seeing the face of famed virus hunter Albert Osterhaus talking about the swine flu pandemic. Or so it has seemed. Osterhaus, who runs an internationally renowned virus lab at Erasmus Medical Center, has been Mr. Flu. But last week, his reputation took a nosedive after it was alleged that he has been stoking pandemic fears to promote his own business interests in vaccine development.Last week, his reputation took a nosedive after it was alleged that he has been stoking pandemic fears to promote his own business interests in vaccine development. As Science went to press, the Dutch House of Representatives had even slated an emergency debate about the matter*." [2]

Albert Osterhaus is no small player. He stands at the global nexus of every major virus panic of the past decade from the mysterious SARS deaths in HongKong, where current WHO Director Margaret Chan got her start in her career as a local health official. According to his official bio at the European Commission, Osterhaus was engaged in April 2003, at the height of the panic over SARS (Severe Acquired Respiratory Syndrome) in investigation of the Hong Kong outbreak of respiratory illnesses. The EU report states, "he again showed his skill at moving fast to tackle a serious problem. Within three weeks he had proved that the disease was caused by a newly discovered coronavirus that resides in civet cats, other carnivorous animals or bats." [3]

Then Osterhaus moved on as SARS cases vanished from view, this time publicizing dangers of what he claimed was H5N1 Avian Flu. In 1997 he had already began sounding the alarm following the death in Hong Kong of a three-year-old who Osterhaus learned had had direct contact with birds. Osterhaus went into high gear lobbying across Holland and Europe claiming that a deadly new mutation of avian flu had jumped to humans and that drastic measures were required. He claimed to be the first scientist in the world to show that H5N1 could be transferred into humans. [4]

In a *BBC* interview in October 2005 on the danger of Avian Flu, Osterhaus declared, "…if the virus manages indeed to, to mutate itself in such a way that it can transmit from human to human, then we have a completely different situation, we might be at the start of the pandemic." He added, "there is a real chance that this virus could be trafficked by the birds all the way to Europe. There is a real risk, but nobody can estimate the risk at this moment, because we haven't done the experiments."[5] It never did manage to mutate, but he was ready to "do the experiments," presumably for a hefty fee.

To bolster his frightening pandemic scenario, Osterhaus and his lab assistants in Rotterdam began assiduously assembling and freezing samples of, well, bird shit, in an attempt to build a more scientific argument. He claimed that at certain times of the year up to 30% of all European birds acted as carriers of the deadly avian virus, H5N1. He also claimed that farmers working with hens and chickens were then exposed. Osterhaus briefed journalists who dutifully noted his alarm. Politicians were alerted. He wrote papers proposing that the far away deaths in Asia from what he termed H5N1 were coming to Europe, presumably on the wongs or in the innards of deadly sick infected birds. He claimed that migratory birds were carrying the deadly new disease as far west as Germany's Baltic island, Rügen, Croatia and Ukraine.[6] He conveniently ignored the fact that birds do not migrate east to west but rather north to south.

Osterhaus' Avian Flu alarm campaign really took off in 2003 when a Dutch veterinary doctor became ill and died. Osterhaus claimed the death was from H5N1. He convinced the Dutch government to order slaughter of millions of chickens. Yet no other infected persons died from the alleged H5N1. Osterhaus claimed that that was simply proof of the effectiveness of the preemptive slaughter campaign.[7]

Osterhaus claimed that bird feces were the source, via air bombardment or droppings, onto populations and birds below. That was the vehicle for the spread of the deadly new Asian strain of H5N1 he insisted.

There was only one problem with the now voluminous frozen samples of diverse bird excrement he and his associates had collected and frozen at his institute. There was not one single confirmed example of H5N1 virus found in any of his samples. At a May 2006 Congress of the World Organization for Animal Health (OIE), Osterhaus and his Erasmus colleagues were forced to admit that in testing 100,000 samples of their assiduously saved bird feces, they had discovered not one single case of H5N1 virus.[8]

At a WHO conference in Verona in 2008 titled "Avian influenza at the Human-Animal Interface," in a presentation to scientific colleagues undoubtedly less impressed by appeals to pandemic emotion than the non-scientific public, Osterhaus admitted that "A proper risk assessment of H5N1 as the cause of a new pandemic cannot be made with the currently available information." [9] By then, however, his sights were already firmly on other possible pandemic triggers to focus his vaccination activities.

A Mexican outbreak of a strange disease rapidly became swine flu, the now-famous H1N1 Influenza A of 2009 and 'Mr Flu' was once more at the forefront sounding the alarm at WHO.

Tip of a big, big iceberg

The financial ties of Eskola and Osterhaus to the pharma industry that stands to gain from their scientific recommendations to WHO is but the tip of a big, big iceberg.

The following list of WHO researchers, prepared by *Information*,[10] name more scientists reported to have financial ties to Big Pharma, suggesting the entire WHO system is systematically corrupt:

*Dr. Peter Figueroa, Professor in the Department of Community Health and Psychiatry in Jamaica, has received money from Merck.

*Dr. Neil Ferguson has received funding from Baxter, GlaxoSmithKline, and Roche, as well as from some insurance companies

*Professor Malik Peiris in Hong Kong has received money from Baxter GlaxoSmithKline and Sanofi Pasteur.

*Dr. Arnold Monto, advisor to Chiron, GlaxoSmithKline, MedImmune, Roche, Novartis, Baxter and Sanofi Pasteur, has received funding from same.

*Dr. Friedrich Hayden, consultant to MedImmune and Sanofi Pasteur, received money from those companies, in addition to Roche, RW Johnson, and SmithKline Beecham.

*'Dr Flu' Prof. Albert Osterhaus has received money from Baxter, Crucell, Novartis, Hoffman-La Roche, MedImmune, Nobilon, Sanofi Pasteur, MSD, GlaxoSmithKline, and Solvay.

The WHO is in the powerful position of reviewing and making vaccine recommendations to the world.

Changing the definition of Pandemic

In an interview with *Der Spiegel* magazine in Germany, epidemiologist Dr. Tom Jefferson of the Cochrane Collaboration, an organization of independent scientists evaluating all flu related studies, noted the implications of the privatization of WHO and the commercialization of health:

Jefferson: *"...one of the extraordinary features of this influenza -- and the whole influenza saga -- is that there are some people who make predictions year after year, and they get worse and worse. None of them so far have come about, and these people are still there making these predictions. For example, what happened with the bird flu, which was supposed to kill us all? Nothing. But that doesn't stop these people from always making their predictions. Sometimes you get the feeling that there is a whole industry almost waiting for a pandemic to occur.*

SPIEGEL: *Who do you mean? The World Health Organization (WHO)?*

Jefferson: *The WHO and public health officials, virologists and the pharmaceutical companies. They've built this machine around the impending pandemic. And there's a lot of money involved, and influence, and careers, and entire institutions! And all it took was one of these influenza viruses to mutate to start the machine grinding...*[11]

When asked if the WHO had deliberately declared the Pandemic Emergency in order to create a huge market for H1N1 vaccines and drugs, Jefferson replied,
"Don't you think there's something noteworthy about the fact that the WHO has changed its definition of pandemic? The old definition was a new virus, which went around quickly, for which you didn't have immunity, and which created a high morbidity and mortality rate. Now the last two have been dropped, and that's how swine flu has been categorized as a pandemic." [12]

Conveniently enough, the WHO published the new Pandemic definition in April 2009 just in time to allow WHO, on advice of SAGE and others like Albert "Dr Flu" Osterhaus and David Salisbury, to declare the mild cases of flu dubbed H1N1 Influenza A to be declared Pandemic Emergency.[13]

Pandemic declaration automatically activates countless national emergency preparations including mandatory stockpiling of vaccines, vaccines supplied, of course, by the same pharmaceutical companies pouring money into the advisors of WHO. For them the new "Golden Triangle" is perhaps even more lucrative than the Asian Golden Triangle of drugs in the 1960's Vietnam War era. And so far it's all legal to boot.

WHO Key Messages – Conflict of Interest Issues

Geneva, WHO, 11 January 2010
https://web.archive.org/web/20100118104158/http://www.wpro.who.int/vietnam/media_centre/press_releases/h1n1_8jan2010.htm

Topics

- Reaction to criticism
- Council of Europe motion to discuss "Faked pandemics: a threat for health"
- Definition of pandemic
- Influence from pharmaceutical industry
- Why WHO recommends vaccination
- Emergency Committee
- Strategic Advisory Group of Experts (SAGE)
- Exaggerated pandemic?

Reaction to criticism

Key messages:

Criticism is part of an outbreak cycle. It's expected. It can be good for public health if criticism highlights a failing of ours. Or it can be harmful, if unfounded assertions undermine good public health advice. We expect and indeed welcome criticism and the chance to discuss it.

Evaluation is a necessary step and we are open to recommendations that can improve our work. When this is over, undoubtedly WHO will work with outside experts to examine its response and their findings will be made public.

Council of Europe motion to discuss "Faked pandemics: a threat for health"

Key messages:

Providing independent advice to Member States is a very important function of WHO. We take this work seriously and guard against the influence of any vested interests. We welcome any legitimate review process that can improve our work.

Definition of pandemic

Key messages:

WHO did not change the definition of pandemic in the course of this outbreak. A pandemic is declared when there have been verified community-level outbreaks of a new influenza virus, passing from human-to-human, in two or more countries in more than one WHO region.

WHO pandemic preparedness guidelines and other background information is available here: http://www.who.int/csr/disease/influenza/pipguidance2009/en/index.html

WHO's pandemic preparedness guidelines were developed in consultation with Member States and pandemic influenza experts over the course of several years. The 2005 pandemic preparedness guidelines were revised over a two year period of consultation and were finalized in February 2009. These were published in April, just as it appeared we were about to face a new pandemic.

Some of the confusion may stem from the fact that there was a document on WHO's website for some months that said a pandemic would include "enormous amounts of cases and deaths". This was removed when it was brought to our attention. This information was never part of the formal definition of a pandemic and was never part of documents sent to Member States for their preparedness work. We regret the confusion it has caused.

WHO has consistently assessed the impact of the current influenza pandemic as moderate, reminding the medical community, public, and media that the overwhelming majority of patients experience mild influenza-like illness and recover fully within a week, even without any form of medical treatment.

Influence from pharmaceutical industry

Key messages: WHO works with a wide range of individuals to obtain the input needed for WHO to address public health issues. WHO has systems in place to safeguard against potential conflicts of interest by experts in its advisory groups.

WHO requires all experts advising the organization to declare all professional and financial interests, including funding received from pharmaceutical companies or consultancies or other forms of professional involvement with pharmaceutical companies. This information is shared with other members of the advisory group and taken into account by WHO in determining whether the experts concerned should continue to provide advice to the organization.

Allegations of undeclared conflicts of interest are taken very seriously by WHO, and investigated immediately.

Why WHO recommends vaccination

Key messages: We need the best tools and best solutions to protect human life - and those tools include vaccines and antiviral drugs.

We work with pharmaceutical companies because they are the ones who make vaccines. Vaccines are not made by the governments or by the public sectors, but by companies in the private sector. We work with these companies in the developed countries and also in a number of developing countries.

Emergency Committee

Key messages: The Emergency Committee was the one that advised the Director-General to declare a pandemic, although the final decision was hers.

To date, the names of these members have been withheld to reduce the possibility or any of them being directly pressured by any outside parties, since any actions or pronouncements taken by WHO under advisement by the Emergency Committee related to a public health emergency of international could have wide social, political and health related consequences.

Strategic Advisory Group of Experts (SAGE)

Key messages: SAGE is a group of experts that advises WHO on all aspects of vaccines. In July 2009, SAGE held an emergency meeting to make recommendations related to pandemic vaccine, including which groups should be prioritized for immunization.

This information is not secret: the names of members of SAGE and working groups of SAGE are published on the WHO web site, along with meeting reports and declarations of interest made by experts attending those meetings. http://www.who.int/immunization/sage/en/

Useful reference: WHO briefing note on use of advisory bodies

http://www.who.int/csr/disease/swineflu/notes/briefing_20091203/en/index.html

Exaggerated pandemic?

Key messages

- Early decisions are made in the midst of profound uncertainties. This is not an excuse but a fact. At the beginning of the pandemic, not knowing if it was a severe or mild disease, WHO had to take actions and make recommendations.
- WHO has consistently assessed the impact of the current influenza pandemic as moderate, reminding the medical community, public, and media that the overwhelming majority of patients experience mild influenza-like illness and recover fully within a week, even without any form of medical treatment.

Drug companies face European inquiry over swine flu vaccine stockpiles

The Guardian, 11 January 2010, 19.47 GMT
https://www.theguardian.com/world/2010/jan/11/swine-flu-h1n1-vaccine-europe

Council of Europe to discuss whether pharmaceutical firms spread alarm over pandemic to boost orders of medicines.

European health chiefs are to hold emergency talks about whether pharmaceutical giants have unduly influenced governments into squandering public money on vast stockpiles of unnecessary swine flu drugs.

The Council of Europe will debate a resolution that accuses drug companies of leaning on public health officials to alarm governments about the risks of H1N1 flu.

The talks, due to be held later this month, come as British ministers decide what to do with a surplus of as many as 20m doses of vaccine ordered at the height of the swine flu outbreak.

"The governments have sealed contracts with vaccine producers where they secure orders in advance and take upon themselves almost all the responsibility.

"In this way, the producers of vaccines are sure of enormous gains without having any financial risks. So they just wait, until WHO says 'pandemic' and activate the contracts," Wolfgang Wodarg, head of health at the Council of Europe, told the Daily Mail.

Wodarg, who proposed the resolution, added that H1N1 virus was "a mild flu and a false pandemic".

Last week, Germany and France announced they would scale back orders or sell excess H1N1 drug supplies. Shares in the manufacturer GlaxoSmithKline (GSK) have fallen as orders are cancelled. The drugmaker had previously estimated total sales of its pandemic flu vaccine across more than 70 countries at £2bn, over 2009 and 2010.

The impact of the H1N1 virus has been less severe than anticipated. At the height of the pandemic scare, around 65,000 deaths were expected in Britain; the current, downgraded estimate is for 1,000 fatalities. The latest death toll for the whole of the UK stands at 360.

The Department of Health confirmed last week that a total of 28.9m doses had already been delivered to the UK – 23.9m from GSK and 5m from another firm, Baxter.

A break clause in the Baxter contract has been exercised by the UK but more orders were due to arrive from GSK. Health officials were negotiating with the firm to suspend further deliveries.

Professor David Salisbury, the Department of Health's director of immunisation, confirmed that discussions about what to do with Britain's surplus vaccine were under way.

But Salisbury stressed: "We have to keep a stockpile for ourselves because we simply don't know what is going to happen over 2010, and we know that there are proportions even within the risk group who have not been vaccinated. – "If there were a UK resurgence during 2010, we would look very foolish if we had disposed of a valuable stockpile."

The options being reviewed include selling it, giving it away, or possibly even keeping one of its component parts – known as an "adjuvant" – to use as the basis of a vaccine for a different virus pandemic in the future.

The text of the resolution prosed by Wodarg calling for an inquiry states that "in order to promote their patented drugs and vaccines against flu, pharmaceutical companies influenced scientists and official agencies responsible for public health standards to alarm governments worldwide and make them squander tight health resources for inefficient vaccine strategies, and needlessly expose millions of healthy people to the risk of an unknown amount of side-effects of insufficiently-tested vaccines."

The total bill for fighting swine flu in the UK was put at £1bn in a parliamentary question back in September. It is expected to have risen since then.

Swine flu 'false pandemic' claim

The Sun, 11 January 2010
https://web.archive.org/web/20120920063159/http://www.thesun.co.uk/sol/homepage/news/2803049/Swine-flu-false-pandemic-claim.html?OTC-RSS&ATTR=News

A leading health expert says the swine flu scare was a "false pandemic" led by drugs companies that stood to make billions from vaccines.

Wolfgang Wodarg, head of health at the Council of Europe, claims major firms organised a "campaign of panic" to put pressure on the World Health Organisation to declare a pandemic.

He believes it is "one of the greatest medicine scandals of the century" – and has called for an inquiry.

An emergency debate on the issue will be held by the Council later this month.

Dr Wodarg said: "It's just a normal kind of flu. It does not cause a tenth of deaths caused by the classic seasonal flu.

"The great campaign of panic we have seen provided a golden opportunity for representatives from labs who knew they would hit the jackpot in the case of a pandemic being declared.

"We want to clarify everything that brought about this massive operation of disinformation. We want to know who made decisions, on the basis of what evidence, and precisely how the influence of the pharmaceutical industry came to bear on the decision-making."

He added: "A group of people in the WHO is associated very closely with the pharmaceutical industry."

The WHO has recently reaffirmed its stance that the pandemic is not over. However, the number of swine flu deaths is dramatically lower than expected.

Last year, Dr Wodarg raised concerns about swine flu vaccines, saying they could cause dangerous allergic reactions.

In an interview with France's L'Humanite, he said: "The vaccines were developed too quickly. Some ingredients (adjuvants) were insufficiently tested.

"But there is worse to come. The vaccine developed by Novartis was produced in a bioreactor from cancerous cells – a technique that had never been used until now.

"This was not necessary. It has also led to a considerable mismanagement of public money.

“The time has come at last for us to make demands on governments. The purpose of the inquiry is to prevent more false alarms of this type in the future.

“We must make sure people can rely on the analysis and the expertise of national and international public institutions. The latter are now discredited, because millions of people have been vaccinated with products with inherent possible health risks.”

He added: “In Germany this has cost about 700 million Euros. But it is very difficult to know the exact figures because we are talking about vaccines resold to foreign countries, and most firms do not communicate due to the principles of ‘trade secrets’.”

It is believed the British government is desperately trying to offload up to £1billion of swine flu vaccine, ordered at the height of the scare.

The Department of Health warned of 65,000 deaths and set up a special advice line and website.

Anti-flu drugs were given out without prescription, and local health authorities were told to prepare for a major outbreak.

Planners were ordered to get morgues ready for the sheer scale of deaths and there were warnings the Army could be called in to prevent riots as people fought to obtain drugs.

But fewer than 5,000 caught the bug last week, and just 251 have died from it overall.

Swine flu 'a false pandemic' to sell vaccines, expert says

NewsCore, 12 January 2010, 5:13PM
https://web.archive.org/web/20100114013335/http://www.news.com.au/world/swine-flu/story-e6frfkyi-1225818388508

Claims swine flu is a "false pandemic" and "a campaign of panic" being used to create a huge market for vaccines are "historically and medically inaccurate", Australia's top medical official says.

Wolfgang Wodarg, head of health at the Council of Europe, has claimed major firms organised a "campaign of panic" to put pressure on the World Health Organisation (WHO) to declare a pandemic, UK tabloid *The Sun* reports. Dr Wodarg is calling for an inquiry into what he calls a "medical scandal".
https://web.archive.org/web/20120920063159/http://www.thesun.co.uk/sol/homepage/news/2803049/Swine-flu-false-pandemic-claim.html?OTC-RSS&ATTR=News

However Australia's Chief Medical Officer, Professor Jim Bishop, today strongly rejected the accusations. "The recognition and declaration of a pandemic by the World Health Organiaation occurred in response to cases and deaths in Mexico and the USA not because of drug companies input or influence," Prof Bishop said.

Prof Bishop also refuted claims by Dr Wodarg that swine flu: "Was a normal kind of flu. It does not cause a tenth of deaths caused by the classic seasonal flu." "Swine flu is similar to ordinary flu but with some dangerous differences," Prof Bishop said. "Swine flu affected a much younger age group.

"The median age of all Australian hospitalisations from swine flu was just 31 years. "The median age of Intensive Care Units (ICU) admissions was 40 years and the media age of deaths in Australia was 48 years. "This is 35 years younger than the median age of death from standard winter flu in Australia is 83 years. "We also saw a sharp increase in the number of people, particualrly younger people who had to be admitted to ICUs."

In an interview with France's *L'Humanite* on Sunday, Dr Wodarg also raised concerns about the swift release of swine flu vaccines. "The vaccines were developed too quickly. Some ingredients were insufficiently tested," Dr Wodarg said.

"The development of a swine flu vaccine was not rushed," Prof Bishop said in reply. "In Australia the vaccine has gone through a rigorous safety assessment by the Therapeutic Goods Administration.

"The safety profile of the Australian CSL vaccine is very well established from clinical trials and worldwide use with millions of doses being safely administered."

The Federal Government has purchased 21 million doses of swine flu vaccine.

The Department of Health and Ageing is encouraging everyone from 6 months upwards to be vaccinated free of charge before swine flu comes back next year.
The WHO recently reaffirmed its stance that the pandemic is not over.
However, the number of swine flu deaths is dramatically lower than expected.

Swine flu taskforce's links to vaccine giant:
More than half the experts fighting the 'pandemic' have ties to drug firms

Daily Mail, 14 January 2010, 12:38 BST,
http://www.dailymail.co.uk/news/article-1246370/Drug-firms-drove-swine-flu-pandemic-warning-recoup-billions-spent-research.html

More than half the scientists on the swine flu taskforce advising the Government have ties to drug companies.

Eleven of the 20 members of the Scientific Advisory Group for Emergencies (SAGE) have done work for the pharmaceutical industry or are linked to it through their universities.

Many have declared interests in GlaxoSmithKline, the vaccine maker expected to be the biggest beneficiary of the pandemic.

The disclosure of the register of interests comes just days after a health expert branded the swine flu outbreak a 'false pandemic' driven by the drug companies which stood to profit.

The Government is now trying to offload up to £1billion worth of unwanted swine flu vaccine.

Last July, the Department of Health warned of up 65,000 deaths, with 350 a day at the pandemic's peak. But the death toll now stands at just 251.

SAGE was created to give Ministers recommendations on how to control and treat the virus.

Official documents show some members are linked to vaccine manufacturer Baxter and to Roche, which makes Tamiflu.

GSK, Baxter and Roche stand to make up to £1.5billion between them from Government contracts related to swine flu.

The scientists declared the interests to the Department of Health.

They were not obliged to declare the amounts they earned but they are thought to range from around £500 for a lecture or presentation to more than £100,000 for a directorship of GSK.

Some will simply be heads of university research departments which received funding from companies.

Liberal Democrat Norman Lamb said last night: 'While there is no evidence that experts acted improperly, the sheer scale of the pharmaceutical industry's influence is a cause for concern and needs to be looked at.'

However, some researchers said industry experience could only add to the scientists' knowledge, enabling them to provide the best and the most up-to-date advice.

Leading flu expert Professor John Oxford said it was right to have people with different types of experience.

He said: 'If you are giving advice about vaccines or anti-viral drugs, you can't sit in your ivory tower and think you know everything about it.'

One of the biggest earners on SAGE is the former rector of Imperial College, London, Professor Sir Roy Anderson. He is a non-executive director of GSK which also makes Relenza, the Tamiflu alternative for pregnant women.

GSK strongly denied any conflict of interest.

It said Sir Roy was asked to rejoin SAGE, which he had left to join GSK, because of his expertise.

The company said: 'He has not attended any meetings related to purchase of drugs or vaccine for either the government or GSK.'

Dr Stephen Inglis of the National Institute for Biological Standards and Control has interests in more than 40 drug companies, all connected to the NIBSC rather than himself.

He says: 'The NIBSC is a centre of the UK's Health Protection Agency, a not-for-profit public body whose purpose is to enhance and safeguard public health.

It must engage with many pharmaceutical companies and, in some instances, it is appropriate to charge them for products and services.'

The Department of Health said: 'Committee members do not take part in discussions that may involve a potential conflict of interest.'

But that raises the possibility of more than half of the handpicked advisers being shut out of key discussions.

Grippe H1N1: prochaine commission d'enquête parlementaire sur la vaccination

Bloog de Guy Chambefort, 22 Janvier 2010.
https://guy-chambefort.typepad.fr/essai_dput/2010/01/gripe-h1n1-prochaine-commission-denqu%C3%AAte-parlementaire-sur-la-vaccination.html

PARIS – Une commission d'enquête parlementaire sur la campagne de vaccination contre la grippe H1N1 à la demande du Nouveau centre (NC, partenaire de l'UMP) devrait prochainement voir le jour, a confirmé mardi le président de l'Assemblée nationale, Bernard Accoyer (UMP).

"Dans les semaines qui viennent, la commission d'enquête se mettra au travail", a indiqué à la presse M. Accoyer après la conférence des présidents, qui fixe l'ordre du jour de l'Assemblée.

Le groupe NC (23 députés sur 577) a fait valoir la semaine dernière son "droit de tirage" (tout groupe parlementaire peut demander une fois par session la création d'une commission d'enquête, qui doit être votée dans l'hémicycle) pour réclamer une commission d'enquête parlementaire sur "les conditions de vaccination" contre la grippe H1N1.

"Il ne s'agit pas de remettre en cause l'action du gouvernement mais de faire le point sur comment la campagne de vaccination s'est déroulée", a déclaré le président du groupe François Sauvadet.

"Ca ne va pas être une commission d'enquête pour désigner Mme Bachelot, a-t-il encore déclaré dans la salle des Quatre-Colonnes. Je crois qu'elle a bien fait son job.

C'est une commission pour accompagner tout gouvernement à mieux gérer les crises de pandémie et à répondre de manière efficace aux questions posées".

M. Sauvadet a encore estimé que "d'après le calendrier", la commission pourrait "intervenir dans les deux mois qui viennent".

Jean-François Copé et Jean Leonetti, président et vice-président du groupe UMP à l'Assemblée nationale, ont vivement déploré mardi la demande du Nouveau Centre, y voyant même une démarche "inamicale".

THE FLU CASE

French Parliamentary inquiry into Swine Flu Scam set to go ahead soon

The Flu Case, 20 January 2010, 16:38
https://web.archive.org/web/20100220012819/http://www.theflucase.com/index.php?option=com_content&view=article&id=2611%3Afrench-parliamentary-inquiry-into-swine-flu-scam-set-to-go-ahead-soon&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French parliament is to set up a special committee to investigate the mass swine flu campaign following a request by the Nouveau Centre (NC) party, it has emerged.

The president of the Assembly, Bernard Accoyer, said on Tuesday that the conference of presidents had agreed to set up a parliamentary inquiry on the „conditions of vaccination".

François Sauvadet of the NC party with 23 deputies said that he believed the committee could be at work within two months.

The mass swine flu vaccination campaign carried out by Health Minister Roselyne Bachelot has come under fierce criticism.

In August, a government document was leaked revealing plans to vaccinate the entire French population by the end of January 2010 in especially established vaccine centres.

However, only an estimated 6 million French people so far have taken the swine flu jab following an unprecedented internet campaign to spread information on its toxicity.

Especially controversial were the requisitions of nurses and doctors, who were compelled to work in the vaccine centres.

Bachelot unexpectedly cancelled vaccine order for 50 million jabs one day after she was summoned to appear in a Paris court – she was represented by her lawyer – to answer allegations of mass poisioning through the vaccine campaign.

A national parliamentary inquiry could be potentially far more damaging than the inquiry at the Council of Europe as parliaments have more power to summon witnesesses and eventually to take corrective legislative action.

PharmaMedia to Squelch EU Council's Secret Investigation into H1N1 Vaccine Fraud and Global Genocide

Natural Family blog, 23 January 2010
https://web.archive.org/web/20100228041435/http://naturalfamilyblog.wordpress.com/2010/01/23/pharmamedia-to-squelch-eu-council%E2%80%99s-secret-investigation-into-h1n1-vaccine-fraud-and-global-genocide

The Parliamentary Assembly of the Council of Europe (PACE) will hold a secret hearing next week into the apparent manipulation by BigPharma of the World Health Organization's (WHO) global H1N1 flu campaign. Experts predict the secrecy will be maintained by the PharmaMedia that controls mainstream news.

The PACE hearing currently advancing was prompted by Dr. Wolfgang Wodarg, chief of health in the Council of Europe representing 47 countries. This inquiry will address the drug cartel's "false flag" pandemic, and the WHO's scandalous promotions of swine flu vaccinations that were "fast tracked," inadequately tested, and now causing more harm than good.

The sanctioned vaccines and drugs, such as Tamiflu, are burdening governments financially and poisoning people globally, experts say.

During my interview of Dr. Wodarg on January 14th, he mentioned he was not re-elected by the German people last September. Studying his previous investigations into criminal drug industry operations and cover-ups, it is likely his defeat was rigged.

"As head of the subcommittee for health," Dr. Wodarg reported from his home in Germany, "I made the motion. and there will be investigations. . . .

"Many countries in Europe are very angry about what the WHO did and how they decided to have a pandemic when there was just a mild flu; and this whole thing was in favor of those companies who had prepared the pandemic plans, and who only needed the judgment of the WHO to have them set in power, and to earn them money," Dr. Wodarg explained.

The Council is expected to consider the sudden inexplicable proclamations of H1N1 vaccine shortages instigated by BigPharma's advertising gurus paid to respond to widespread distrust of the manufactured flu fright and vaccine sales hype.

Global pandemic promoters used frightful messages to convince scientists, doctors, and global populations that pandemic H1N1 threatened to kill millions. Instead, the virus caused only a tiny fraction of deaths reported during a normal flu season.

PharmaMedia to Squelch Crimes

Many observers believe the urgently needed investigation is unlikely to make any significant difference in public perceptions since drug industrialists have a knack for steering their allies in the media clear of controversy; especially this kind of explosive scandal.

"PharmaMedia controls the mass mind more effectively than any covert psychological operation in world history," said Dr. Leonard Horowitz, a Harvard-trained media expert and world leading vaccine risk analyst. Dr. Horowitz is also the Editor-in-Chief of Medical Veritas journal.

Few people realize the connections between major drug companies that produce H1N1 vaccines and media moguls on the boards of directors of BigPharma's leading companies.

According to Dr. Horowitz, media moguls spin the news and mass mindset impacting geopolitics, economics, and governmental policies on behalf of BigPharma because they are heavily invested in the drug cartel. News blackouts and promotional propaganda are all that is needed to maintain the status quo in favor of ongoing fraud and mass murder. This is his conclusion based on rock solid evidence his colleagues and contributors have published in the peer review science journal Medical Veritas.

What if Dr. Wodarg, Dr. Horowitz, and the Health Minister of Poland, Dr. Ewa Kopacz, who rejected the vaccine hype and sales contracts because of the obvious fraud, are all right?

Who Ordered the Shortage Marketing?

To diagnose this surreal tragedy accurately, one need only consider the source of the shortage marketing directive. There was a dramatic orchestrated change in global media promotions the third week of October. Investigators must ponder why adequate supplies of vaccines widely acknowledged before October 16, 2009, suddenly disappeared following a Council on Foreign Relations (CFR) meeting on this subject held in New York on this date.

The "H1N1 Pandemic Study Group" meeting was led by Laurie Garrett – a noted journalist whose works exemplify PharmaMedia's methods of conducting white collar bio-terrorism and psychological warfare. Her messages, like other authors "selected" for media stardom, create markets and stimulate sales for the petrochemical-pharmaceutical cartel, especially through lucrative sales of vaccines and drugs following frights.

Garrett's study group decided that the most effective response to the public's overwhelming aversion to getting vaccinated was to feign a vaccine shortage. One week later, the media, led by Thomas Glocer's Reuters News Service and Rupert Murdoch's News Corporation, suddenly declared the alleged shortages.

It turns out that Murdoch, directing most powerfully the influential media, including Fox News, the Associated Press (AP), Twentieth Century Fox, Time Warner, and much more, controls the Murdoch Childrens' Research Institute (MCRI) in Australia, responsible for the first H1N1 Swine flu tests on children 6 months to 8 years of age.

Murdoch's son, and heir apparent, James, the Chairman and Chief Executive of News Corporation for Europe and Asia, is an overseer of GlaxoSmithKline's Board of Directors. They are one of six companies that make H1N1 vaccines.

Thomas Glocer, the CEO of Reuters, is also on the Board of Directors of Merck & Co., and a partner with Rupert Murdoch in the Partnership for New York City that personifies the heart of this drug ring. The partners profitably advance biotechnology and "genetopharmaceuticals" globally, more than any other consortium.

This PFNYC was founded by David Rockefeller who controls the CFR and World Health Organization (WHO). Rockefeller-approved Co-Chairs of the PFNYC include Rupert Murdoch and Lloyd Blankfein, the chief of Goldman Sachs who financed the merger of MedImmune and Astrozeneca, producers of FLUMIST–the nasal spray H1N1 vaccine. Blankfein holds millions, perhaps billions, of dollars of the company's stock.

"Now these unholy alliances have yet to be acknowledged adequately because these H1N1 vaccine investors have zero reason to expose themselves," Dr. Horowitz said. "So regardless of what PACE investigators find, these PFNYC partners will either spin their stories suitably, or neglect them entirely, leaving populations clueless about what is really happening behind BigPharma's deceptive media."

"The goal of our work," Dr. Wordarg revealed, "is to reinstill trust into very important health organizations we need – such organizations who will cooperate internationally, and who are important in the network of international knowledge about possible health dangers."

"But this influenza was twice blown up," the German medical chief continued, "once as a bird flu, and the second time as the swine flu. There was no scientific evidence for either."

Genetic Mutation Risking Human Extinction

The most urgent troublesome investigation to be conducted by PACE, and the least likely story to be told by PharmaMedia, involves the FLUMIST vaccine. It transmits "live" "active" unstable viruses–clones of H1N1; mutants created in drug labs–that are passed from vaccinated persons to others not infected. These transmissions risk genetic mutations all along the way.

"Stupid is as stupid does," said Rev. Roxanne Hampton, referring to the gullable people who consented to get vaccinated and now pose a risk to their family, community, and even the entire human race due to the genetic mutation risks. As a legislative aid in Hawaii who helped the Big Island's County Council investigate the H1N1 vaccine hype and its risks, Rev. Hampton has advised government attorneys of the fraud committed by local health officials. "I pray they will take action similar to the investigation that PACE is advancing in Europe," she added.

According to Dr. Harold Buttram, and his latest report in the Winter 2010 issue of Medical Veritas, this pandemic flu operation has already exposed millions of healthy people to genetic mutation risks beyond deadly side effects caused by these injections.

Other experts report that recombinations of H1N1 are expected with more deadly viruses in circulation. Even human DNA risks mutations from infections with bioengineered H1N1s. These risks threaten civilization with extinction according to many avid investigators, doctors, and concerned scientists.

Vaccine truth activist Ingri Cassel of Vaccination Liberation Organization (www.VacLib.org) claims that vaccines were born in fraud and have been laying the foundation for sick and diseased populations ever since.

"New vaccines on the market are claimed to be more sterile, laboratory tested and safer," Ms. Cassel said. "Nothing can be further from the truth. All vaccines are mutagenic by nature – including the highly unstable triple recombinant vaccines–which are changing our genetic code. When one looks at the whole picture, vaccines represent an attack on our God-given right to natural immunity and genetic integrity. This genocidal madness needs to be halted and the real criminals – vaccine manufacturers and their promoters–held accountable."

Medimmune and other pharmaceutical companies have recalled millions of doses of vaccines in recent weeks, including FLUMIST nasal spray due to its alleged "inadequate shelf life." But critics assert this is a distraction given the aforementioned risks of genetic annihilation. There are more pressing problems including increasing sterilization, Ms. Cassel reports.

"I have an eye on this," Dr. Wodarg said, considering the many outspoken doctors and activists who have written objections and public alerts about genetic threats of H1N1 vaccinations.

"There will be more in France, and there will be more perhaps in Australia and Switzerland. The Polish people have been very critical to vaccinations. They didn't buy these vaccines. The health minister of Poland has a public health background. She's a doctor, and Poland is the only country that said no to WHO, and didn't follow the pandemic frenzy. They didn't buy the vaccines because they thought they were too dangerous."

Oversupplies Trouble Governments

According to European news sources, because the vast majority of world villagers have refused these vaccines, governments cannot dispose of their stockpiles. They literally cannot give away the H1N1 vaccines that cost billions of dollars to purchase just a few months ago during the feigned emergency.

So health officials have also been pitching their excessive vaccine stocks more suspiciously and aggressively to broader markets.

On Friday, January 15, USA Today evidenced health officials resorting to media blitzes alleging the need for follow-up injections. The weak yet risky first doses of H1N1 vaccines taken by millions of people are inadequate alone, they warned, for protection against a virus admittedly causing less than 6 percent of the fatalities from a normal seasonal flu.

According to the Murdoch-AP-influenced Hawaii Star Bulletin, the H1N1 vaccines are now being offered to everyone. The plentiful injectables are now suitable for even low risk groups, health officials claim.

The determination of "risk groups" came from supposed reported cases collected by the CDC early in the pandemic. Later it was learned that their data was overblown by 84-97% according to a CBS News investigation widely publicized in late October, 2009. Thus, there is no good reason to assume the risk groups were identified legitimately.

Dr. Horowitz, who was the first investigator in the world to declare the alleged H1N1 pandemic was a scam, balked at the risk of vaccinating pregnant women with mercury preserved formulas. "Vaccinations," he noted, "have traditionally been elective procedures for pregnant women respecting sensitive rapidly-growing fetal nerves."

Neurotoxic mercury affects fetal neurology most powerfully, researchers say. Infant growth and development, and neurobehavioral disorders including autism, are risked by Thimerosal mercury-laced injections.

Dr. Horowitz was also among the first to raise concerns that new H1N1 vaccine adjuvants containing Nonoxynol-9 spermicide might cause abortions. This neglected warning has resulted in possibly a thousand H1N1-induced miscarriages to date.

"We are up to about 200 women who have had H1N1 vaccine-triggered spontaneous abortions according to records we are mailing to American legislators," said Eileen Dannemann, Director of the National Coalition of Organized Women (NCOW). NCOW is calling for an official American investigation in step with the European Parliament's Council.

Spontaneous abortions are being reported to NCOW daily, Ms. Dannemann reported, "And this is only by word-of-mouth, without word getting out in the media. We've asked grieving moms to contact us to file their reports."

CDC officials admit they collect only about 10% of vaccine injuries. They call these "adverse events." Spontaneous abortions are included. So if our current count is nearly 200, and this represents only about 10%, the actual miscarriages to date number, very conservatively, approximately a thousand."

With such high numbers of terminated pregnancies, for all we know the addition of abortifacients into H1N1 vaccines, ingredients that cause spontaneous miscarriages, evidences a population control exercise. Previously considered "unspeakable," this is now possible since leading vaccine industrialists, and chief health officials, including Barack Obama's Science Czar, John Holdren, endorse and finance the Population Council whose efforts advance rapid widespread depopulation using vaccinations for sterilization. Holdren wrote about this in his 1977 co-authored book, EcoScience, and this was done in the past with vaccines poisoned with HCG, a female pregnancy hormone.

The Population Council also tested and licensed RU-486, the "abortion pill," sadistically named to refer to the slang question, "Are you for 86-ing (trashing) life?" Dr. Horowitz notes.

Adding to the public's distrust of governing health officials, in Hawaii, Director of Public Health, Chiyome Fukino, who is a defendant in a lawsuit filed by Philadelphia attorney Phil Berg for concealing evidence required to certify President Barack Obama's official birth certificate, falsely testified to legislators last year that H1N1 vaccines were adequately tested.

Fukino alleged some magic "threshold" of "herd immunity" determined that unvaccinated persons pose a "serious threat" to vaccinated people. Due to her fraudulent claims, State attorneys have been asked by County of Hawaii Council Co-chair, Emily Naeole-Beason, to investigate Dr. Fukino for fraud, official malfeasance, and genocidal malpractices.

Strict whistleblower statutes criminalize false claims made to governing officials costing governments millions of dollars for vaccines and drugs fraudulently promoted. Fukino purchased millions of dollars of Tamiflu and FLUMIST for the State. Now she may face criminal charges pending an official investigation.

"We have a very powerful investigation advancing," in the EU, said Dr. Wodarg. He cited "the very doubtful way the WHO acted, and the whole matter, of the H1N1 scandal."

"I think we should start with this [obvious breach of faith]," the retiring health chief of PACE said of the manufactured flu frenzy. "I am open to investigating to find out more," Dr. Wodarg concluded, referencing the little publicized connections between the makers of H1N1 vaccines and the media manipulators with private equity investments in these vaccinations.

Swine Flu Experts under the influence of laboratories

Extracted from Le Parisien
The Flu Case, 26 January 2010, 07h 00
https://web.archive.org/web/20100220013208/http://www.theflucase.com/index.php?option=com_content&view=article&id=2656%3Ale-parisien-explores-pharma-links-to-who-and-french-govenrment&catid=1%3Alatest-news&Itemid=64&lang=en

This morning, WHO's number two, Dr. Keiji Fukuda, will be heard in Strasbourg by the Health Committee of the Council of Europe. European MEPs want to know if the UN agency has been under pressure from the pharmaceutical industry in managing the Swine Flu crisis so as to exaggerate the danger.

They also will interview a spokesperson of European manufacturers of vaccines, again to see if they have sought to influence the WHO experts.

These hearings are conducted at the request of the medical expert, Wolfgang Wodarg, the German Socialist deputy, who, with fourteen other parliamentarians from across the political spectrum, will then write a parliamentary report on this subject, asking "On what scientific basis did WHO declare a pandemic? The organization will have to explain the bonds of money between some of its experts and laboratories."

According to our investigation, links of interest between six experts from WHO and the pharmaceutical industry are proven. They were part of policy committees who advised the Director Margaret Chan. Even if they declare their independence, their relationship with the laboratories upholds suspicions about the impartiality of their decisions within the WHO. In France, the same questions exist. A majority of the experts on the committee for fighting flu, appointed by the Health Minister, Roselyne Bachelot, has links of interest with the companies manufacturing the vaccine and antivirals against Swine Flu.

Swine Flu: In Geneva and Paris, experts justifcations

We contacted various experts, French or foreign, serving on committees in France or for the WHO in Geneva, who reported links of interest with pharmaceutical companies. Without denying their relationships with certain laboratories, they assert their intellectual independence.

The Professor of Medicine from Finland, Juhani Eskola, says he "clearly indicated his contract with Novartis in his full declaration of interests for WHO. He said he performed this procedure when he was appointed to serve on the Sage Committee, the first group of advisors for Swine Flu. He adds: "My statements were viewed, evaluated and validated by WHO, which said there were no problems." It was the same for his contract with GSK, which funds his research institute in Finland up to 6 million euros.

The Jamaican researcher, Peter Figueroa, under contract with pharmaceutical giant Merck, whose drugs are used against influenza, responds for its part that "the funds thus obtained were dedicated to research on specific topics. In no case did this influence my choice "in debates within the World Health Organisation.

In France, among the experts who advised Roselyne Bachelot, the answers are no different. Sylvie Van der Werf, one of the most often cited researchers of the Pasteur Institute for her research on pandemic influenza, admits to collaboration with GSK on treatment research. "But I do not feel that my scientific independence is at all affected when I give an opinion in a public committee, she said. Anyway, most senior experts also work with the pharmaceutical industry ". Her colleague from the Pasteur Institute, Jean Claude Manuguerra, director of the committee against flu, also mentions collaboration with Roche. When contacted, he did not respond to our requests.

Dr. Jean-Louis Bensoussan

"The Ministry of Health was aware and should have told us if it was a concern

Finally, the GP Jean-Louis Bensoussan, director of regional groups for flu observation, is also a member of the committee against influenza. He justified his personal remuneration by the Roche Group, a group that also manufactures Tamiflu, a drug used against swine flu, by saying "I do not see where the problem is. The Ministry of Health was fully aware and should have told us if it was a concern."

Swine Flu: Doubts about Roselyne Bachelot's committee

The Minister of Health established a group of experts to advise her on Swine Flu. Several of them are now in the heart of the controversy.

The committee for fighting influenza. Created by decree on July 25, 2008 "to bring the Minister of Health expertise on all the measures to be implemented in order to control and reduce the impact of an influenza epidemic or pandemic".

It was this committee that called for mass vaccination in September 2009, with priorities: hospital staff, pregnant women, and those who were most vulnerable, and then the rest of the population. The seventeen experts on this committee were all appointed by decision of the he Minister of Health. In 2009, only two of them had no link with the interests of firms. More significantly, six have received personal remuneration this year from laboratories.

Analysis of the epidemic. Many scientists question the fact that medical authorities did not see, in August, that the virus was much more benign than the Mexican crisis of April led to expect.

Yves Charpak, infectious disease specialist, asks: "We never had the final record of the inquiry made in Mexico on the mortality of the H1N1 virus, carried out by the official representative of France and chairman of the committee, Dr. Manuguerra. If, as assumed, the figures showed that it was far less serious than initially evoked by Mexicans, this committee should have made this information public. Instead, it continued to evoke the risk of major pandemic to come for the winter."

Project for a parliamentary inquiry. The position of some of the experts on the committee has become delicate. "Imagine for two minutes that several experts were against the principle of mass vaccination during closed proceedings. This would have meant they were going against the interests of their employer, which was not an easy decision to take, "says Senator Francis Autain from the socialist party, a doctor, who wants to launch a committee for a parliamentary inquiry on this subject.

French Government Experts

Jean Claude Manuguerra – French chairman of the committee for fighting influenza, a researcher at the Pasteur Institute and also paid by Roche.

Jean-Louis Bensoussan – French member of the committee against influenza, Director of Grog (regional groups of observation of influenza) and paid by Roche.

Sylvie Van Der Werf – French member of the committee against influenza, a researcher at the Pasteur Institute in Paris and also paid by GSK.

Brigitte Autran – French member of the committee against influenza, a professor of medicine at the Pitie-Salpetriere Hospital, and also paid by Sanofi-Pasteur.

Catherine Weil-Olivier – French member of the committee against influenza, paediatrician and also paid by Sanofi GSK and Roche.

Beytout Jean – French member of the committee against influenza, a professor of medicine at Clermont-Ferrand and also paid by Novartis.

Swine Flu: Margaret Chan and her very special advisers

Different groups of experts advise the Director General of WHO, Margaret Chan, in decisions relating to swine flu. However, many of these scientists have financial ties with pharmaceutical companies.

The Sage Committee. This is the main consultative group of WHO for vaccination.

It is composed of fifteen international scientists, who only report to Margaret Chan. It was following the recommendations of the Sage committee that she announced, on June 1, the transition to phase 6 of the pandemic. A decision which prompted governments to buy massive amounts of vaccines for prevention.

Three committee members are paid by pharmaceutical companies, in addition to their work as a researcher: the Finn Juhani Eskola, Jamaican Peter Figueroa and Chinese Malik Peiris. "In such a strategic committee, one might expect the WHO to take more precautions to avoid conflicts of interest," said French researcher Yves Charpak, formerly of the Geneva institution.

The committee for swine flu vaccination. It was established in April 2009, when the flu epidemic began in Mexico. It is responsible for providing recommendations to the Director General of WHO. In addition to three members of the Sage, it includes ten experts who are supposed to be independent. Two of them have proven links of interest with manufacturers of vaccines: the Englishman Neil Ferguson and Dutchman Albert Osterhaus. "During discussions with them, I was surprised by their entrenched positions. I had doubts when I heard they were paid by laboratories, "says a WHO expert who works on swine flu.

A Frenchman in a technical committee. There are other committees within WHO, one of which is responsible for giving advice to Margaret Chan on the evolution of the pandemic. The Frenchman Bruno Lina directs the committee. This virologist is paid for various programs by laboratories producing vaccine (Baxter, Sanofi, Novartis, GSK).

Experts for WHO

Bruno Lina – French, the head of a technical committee of the WHO, a virologist at the CNRS in France, also paid by Roche, Novartis, GSK and Sanofi-Pasteur. Also member of the French committee for fighting flu.

Juhani Eskola – Finnish, a Sage Committee member at WHO, Director of the Health Institute in Helsinki and also paid by Novartis and GSK.

Peter Figueroa – Jamaican, a member of Sage Committee, a professor at the Faculty of Science in Kingston and also paid by Merck.

Albert Osterhaus – Dutch, an expert on Swine Flu Immunization Committee at WHO, a shareholder of Viroclinics, which develops treatments against swine flu.

Malik Peiris – Chinese, a Sage Committee member, a professor at the Faculty of Medicine of Hong Kong and also paid by Baxter, Sanofi Pasteur and GSK.

Neil Ferguson – English, an expert on the Swine Flu Immunization Committee at WHO, a professor of medicine at Imperial College and also paid by Baxter, GSK and Roche.

Swine Flu Didn't Fly

TruthOut, 28 January 2010
=> quite similar to the previous one
https://truthout.org/articles/swine-flu-didnt-fly/

For makers of the swine flu vaccine, 2009 was a year to remember. By June, CSL Limited's profits rose 63 percent above 2008 levels, while in the third quarter of 2009 - just about the time H1N1 contracts picked up steam - GlaxoSmithKine enjoyed a 30 percent jump in earnings to $2.19 billion. Roche, the maker of Tamiflu, which prevents H1N1, saw second quarter profits leap to 12 times what they were in that quarter of 2008. But in 2010, drug companies may get their comeuppance.

On Tuesday, the Council of Europe launched an investigation into whether the World Health Organization (WHO) "faked" the swine flu pandemic to boost profits for vaccine manufacturers. The inquiry, held in Strasbourg, France, vindicates a worldwide movement of insiders, experts and elected officials who accuse the United Nations organization of misleading the world into buying millions of unnecessary vaccines.

"I have never heard such a worldwide echo to a health political action," said Dr. Wolfgang Wodarg, an epidemiologist who formerly led the health committee for the Council of Europe, at Tuesday's hearing.

Also present was Dr. Ulrich Keil, director of the WHO's Collaborating Centre for Epidemiology. Keil hammered his own organization and WHO flu chief, Dr. Keiji Fukuda, for "producing angst campaigns."

"With SARS, with avian flu, always the predictions are wrong ... Why don't we learn from history?" Keil asked. "It [swine flu] produced a lot of turmoil in the pubic and was completely exaggerated " exaggerated" in contrast with all the really important matters we have to deal with in public health."

Last year the WHO predicted that H1N1 could infect two billion and claim hundreds of thousands of lives, while President Obama's science advisers said the outbreak could infect up to 120 million Americans and kill 90,000.

But in the end, H1N1 turned out to be one of the milder flu strains on record. The type-A influenza is confirmed to have taken around 14,000 lives worldwide, according to WHO numbers from January 22. The CDC said in December confirmed US deaths had reached 4,000, although it recently estimated that due to underreporting, the true death toll could be as high as 16,500 - a tragic sum, but less than half of what the CDC attributes to seasonal flu-related illness. In most of the northern hemisphere, hog flu has been on the decline for some ten straight weeks. New transmissions are largely contained to North Africa and South Asia, according to the WHO.

Throughout 2009, the WHO and domestic health agencies around the globe ignored mounting signs that swine flu wasn't much of a killer, choosing instead to man the war bugles at full volume. The result was that governments poured tens of billions of dollars into vaccines. The US alone has spent $2 billion on the drugs and has allocated $7.5 billion in supplemental spending for H1N1 preparedness.

Now that the disease has petered out ahead of schedule, however, countries are stuck with millions of unused doses. French and German governments have had to cancel millions of orders of the vaccines due to falling demand and late-breaking news that European health authorities had recommended twice the necessary dosage. The CDC has dealt with the glut in another way. It now says all Americans should go and get the shot – a shift from its earlier recommendation that at-risk groups such as the young, sick, pregnant and nurses seek injections first. But why should everyone get a shot when that the disease appears to be over?

...

Corruption in Health Organizations?

Critics of the WHO say they promoted bad data to help drug makers get rich selling vaccines. This attack implies drug makers have a network of influence within the decision-making structure of the organization, a suggestion various officials confirm.

One high-level, long-term WHO employee, who preferred to remain anonymous for job security, described the WHO as follows: "WHO is infested by corruption. There is big corruption, like the management of H1N1, and there is small corruption; and between the big and the small corruption there is [corruption] in all imaginable forms. Unfortunately, it's not only the WHO."

Similar comments have come from other WHO insiders, such as William Aldis, a retired senior official who worked on the bird flu crisis. In a Huffington Post article from September 24, Aldis characterized the WHO's handling of swine flu in the following way:

"I am concerned WHO's communications is corrupted by the fact they push the buttons in the public's brains that will raise the most funds. That is incompatible with what the organization should be doing: serving the public with technically correct factual information, pure and simple."

Aldis Louise Voller, a journalist at the Danish Daily Information newspaper, has reported that pharmaceutical companies are present at meetings of WHO experts, and that purportedly independent scientists hired by the WHO are also consultants to the drug companies that make the vaccines.

=> https://www.information.dk/udland/2009/11/staerk-lobbyisme-bag-who-beslutning-massevaccination?lst_cntrb

On Tuesday, WHO's Fukuda insisted that its swine flu scientists' were not tainted by their private sector associations. The reason, he said, is that before each meeting, scientists are asked to declare all possible conflicts of interest. "These documents are gone over and examined. If there is some potential conflict of interest we go back and talk with them."

While the WHO was initially set up to rely on funding from UN member countries, in recent years, this source has been rapidly overtaken by "voluntary contributions," which are provided by the private sector, national governments and NGOs. According to the WHO's 2008-2009 budget, $958 million was supplied by the UN, while three times as much - $3.2 billion - came from voluntary donations.

The WHO reports that only around 1 percent of these voluntary contributions come from the private sector, but the real total of private influence may be obscured. For example, companies can donate to foundations or NGOs which support their interests, thereby concealing the source of their contributions. According to internal WHO emails received by the British Medical Journal and described in a February 17, 2007, article, Benedetto Saraceno, the director of the WHO's department of mental health and substance abuse, advised a patient group to accept money from GlaxoSmithKline and then pass it on to the WHO in order to mask the money's origins.

Dr. Wodarg told the Council of Europe Tuesday that there has been dissent ever since the shift toward public-private partnership began in earnest in 2001.

"Already then there were very critical voices against the influence. [WHO's] administration is made of people not well paid who can't fight against the pay of people in and from the industry - they are simply swept aside ... [private] influence is rampant and that is why we can't understand why the WHO we used to love ... has become unrecognizable to us."

Journalist and author William Engdahl has made it his mission to focus on one WHO expert in particular, Dr. Albert Osterhaus. Osterhaus sat on the WHO's Strategic Advisory Group of Experts (SAGE), which made strategic decisions regarding swine flu. Osterhaus is linked to "every major virus panic of the past decade, from the mysterious SARS ... [to] publicizing dangers of what he claimed was H5N1 Avian Flu," and even to swine flu, Engdahl reported.

On October 16, Science magazine said this about Osterhaus:
"For the past 6 months, one could barely switch on the television in the Netherlands without seeing the face of famed virus hunter Albert Osterhaus talking about the swine flu pandemic. Or so it has seemed. Osterhaus, who runs an internationally renowned virus lab at Erasmus Medical Center, has been Mr. Flu. But last week, his reputation took a nosedive after it was alleged that he has been stoking pandemic fears to promote his own business interests in vaccine development."
=> https://www.science.org/doi/full/10.1126/science.326_350b

A Science blog from November 3 said Osterhaus had emerged from the investigation unscathed.
Russian lawmaker, Igor Barinov, chairman of the Duma Health Committee, recently launched an investigation into corrupt relations between the WHO and the pharmaceutical industry. If the investigation confirms allegations against the WHO, Barinov said Russia should withdraw from the WHO.

A similar scheme for potential corruption is present at the CDC. On June 8, just a few days before the WHO declared swine flu a pandemic, the CDC was taken over by Dr. Thomas Frieden. Prior, Frieden had been the top health official in New York City and worked overseas for the WHO. In both capacities, he was an active proponent of mass vaccinations against tuberculosis. Under Frieden's direction, the CDC announced a hefty vaccine-based response to the virus and outlined a distribution effort that some doctors say constitutes the largest vaccine experiment ever on pregnant women.

The former CDC director, Dr. Julie Gerberding, was hired by Merck in December to serve as president of the vaccine department. While in charge of the CDC, Gerberding came under intense criticism for bonuses she gave to employees who worked closely with her. And during the Bush presidency, Gerberding oversaw a drastic, multi-year revamping process at the CDC in which dozens of the organization's most respected experts quit their jobs.

The Washington Post reported on August 31, 2004, that a number of CDC officials thought the restructuring plan was "part of a larger administration effort to politicize science." In one organizational shift, vaccine safety was moved out of the domain of the National Immunization Program.

Robert A. Keegan, a high-level official, circulated a memo among the CDC's top leaders in which he revealed that employees who disagreed with official data had been "cowed into silence," the Post reported on March 6, 2005. Margaret Scarlett, who spent 15 years in the Centers' AIDS program before leaving in 2001, was quoted as saying, "Political ideology is being substituted for science."

A possible source of monetary influence by drug makers is the CDC Foundation, a nonprofit organization, which raises money for the CDC's efforts through private donations. Whatever the means, clearly the capacity and incentive for drug makers to lean on science are enormous.
...
All US contracts for H1N1 vaccines went to just five companies: CSL Limited, Novartis, Sanofi Pasteur, GlaxoSmithKline and MedImmune. All five also produced shots for either SARS or avian flu. When the response to swine flu took full flight in the second and third quarters of 2009, these firms' earnings skyrocketed. But according to British MP, Paul Flynn, that was part of the drug makers' plan.
Prior to winning any contracts, drug makers invested $4 billion in preparations for swine flu, he said. That investment may have gone to developing and patenting new, super-fast methods to create vaccines, such as using a bioreactor to grow viruses, said Dr. Wodarg.

Le Monde

Grippe A : des eurodéputés demandent une commission d'enquête

Le Monde avec AFP, 9 mars 2010 à 17h40
https://www.lemonde.fr/planete/article/2010/03/09/grippe-a-des-eurodeputes-demandent-une-commission-d-enquete_1316825_3244.html

Des députés européens dénoncent la manière dont les autorités sanitaires ont fait face à la grippe A(H1N1) et l'argent "gaspillé", selon eux, dans la campagne de vaccination.

Des députés européens ont demandé mardi 9 mars que le Parlement se dote d'une commission d'enquête sur la manière dont les autorités sanitaires ont fait face à la grippe A(H1N1) ainsi que sur l'argent *"gaspillé"*, selon eux, dans la campagne de vaccination.

Pour voir le jour, la commission d'enquête devra être approuvée d'ici deux semaines par un quart des parlementaires, soit cent quatre-vingt-trois élus. Les eurodéputés qui ont pris l'initiative de cet appel sont originaires de plusieurs pays et issus de tous les groupes politiques. Ils dénoncent les *"moyens disproportionnés"* mis en œuvre pour faire face à la pandémie, qui au final s'est avérée beaucoup moins grave que redouté initialement.

Si cette commission était créée, elle devrait notamment s'intéresser au rôle des autorités sanitaires de l'Union européenne (Centre européen de prévention et de contrôle des maladies et Agence européenne des médicaments). Elle devrait également se pencher sur les éventuels *"conflits d'intérêts"* nés du fait que certains experts consultés par les autorités travaillent aussi pour des laboratoires pharmaceutiques, a fait valoir la centriste française Corinne Lepage.

"Quelle confiance les citoyens européens pourront-ils avoir lors de prochaines pandémies si l'on ne remet pas à plat notre fonctionnement ?" a demandé l'élue écologiste française Michèle Rivasi. *"Il ne s'agit pas de condamner qui que ce soit, mais plutôt de retenir des leçons pour la prochaine fois. Car il y aura une prochaine fois, et ce pourra être beaucoup plus grave"*, a estimé la conservatrice britannique Marina Yannakoudakis.

THE FLU CASE

Call for swine flu vaccine campaign inquiry in European Parliament

The Flu Case, 10 March 2010, 14:07
https://web.archive.org/web/20100525025706/http://www.theflucase.com/index.php?option=com_content&view=article&id=2962%3Acall-for-swine-flu-vaccine-campaign-inquiry-in-european-parliament&catid=41%3Ahighlighted-news&Itemid=105&lang=en

MEPs have called for an commission of inquiry in the European Parliament on the handling of the swine flu pandemic, according to Le Monde and AFP.

Green MEP Michele Rivasi said that several EU countries had spent "enormous" amounts of money for mass vaccinations using an inadequately tested vaccine.

The European Parliament should investigate if conflicts of interests were involved in the pandemic emergency declaration over the swine flu, Rivasi told AFP.

Links between experts working for the EU and pharmaceutical industry should be examined.

The call for a commission of inquiry has so far been backed by 14 MEPs from across the political spectrum.

183 MEPs have to sign up in the next two weeks for the request to be sent to party chiefs for consideration.

A commission of inquiry has already been announced in the French parliament.

Also, UK MP Paul Flynn is preparing a report for the Council of Europe Parliamentary Assembly on whether pharmaceutical industry influenced WHO in declaring a pandemic emergency level 6.

Report in Le Monde (translated by Carolyn Dunning):

MEPs called on Tuesday, March 9 for the Parliament for the creation a commission of inquiry into how health authorities dealt with the influenza A (H1N1) flu and on the money "wasted", according to them, involved in the vaccination campaign.

For this to happen, the commission of inquiry will have to be approved within two weeks by a quarter of parliamentarians, that is to say one hundred eighty-three elected members. MEPs who initiated this call came from several countries and from all political groups. They denounced the "disproportionate means" implemented to address the pandemic, which ultimately proved less serious than initially feared.

If this commission was created, it should particularly address the role of health authorities in the EU (European Centre for Prevention and Disease Control and European Medicines Agency). It should also focus on possible "conflicts of interest" which arose from the fact that some experts consulted by the authorities also work for pharmaceutical companies, argued the French centrist, Corinne Lepage.

"How will Europeans be able to trust us during future pandemics if we do not completely revise our operations?" asked the French elected environmentalist Michele Rivasi. "This is not to condemn anyone, but rather to draw lessons for next time. For there will be a next time, and that may be much worse," said the British conservative Marina Yannakoudakis.

DIE TAGESZEITUNG junge Welt

Umgang mit «Schweinegrippe» prüfen

Junge Welt, 10 March 2010
https://www.jungewelt.de/loginFailed.php?ref=/artikel/140817.umgang-mit-schweinegrippe-pr%C3%BCfen.html

Europaparlamentarier kritisieren fraktionsübergreifend Massenimpfungen. Untersuchungsausschuß gefordert.

Straßburg – Im Europaparlament haben Abgeordnete aus allen maßgeblichen Fraktionen die Einrichtung eines Untersuchungsausschusses zum Umgang mit der sogenannten Schweinegrippe gefordert. Mehrere EU-Staaten hätten wegen der Warnung vor einer angeblichen Pandemie »enorm viel Geld« für Massenimpfungen ausgegeben, sagte die französische Grüne Michèle Rivasi. Zudem seien zahlreiche Menschen als »Versuchskaninchen« für unzureichend getestete Impfstoffe benutzt worden.

Der Untersuchungsausschuss solle ermitteln, ob "Interessenskonflikte" zu der falschen Pandemie-Warnung geführt haben, sagte Rivasi weiter Dazu sollten mögliche Verbindungen der von der EU angehörten Experten zur Pharma-Industrie durchleuchtet werden.

Die Forderung nach einem Untersuchungsausschuss wurde bislang von 14 Abgeordneten unterstützt, unter ihnen Christdemokraten, Sozialdemokraten, Liberale, Linke und Grüne. Sie wollen nun innerhalb von zwei Wochen die notwendigen 183 Unterschriften sammeln. Anschließend müssen sich die Fraktionsvorsitzenden mit dem Vorschlag befassen.

Im Europarat hatten Experten und Mitglieder der Parlamentarier-Versammlung Ende Januar harsche Kritik an der Weltgesundheitsorganisation (WHO) geäußert. Sie warfen der UN-Organisation vor, die Schweinegrippe voreilig zur Pandemie erklärt zu haben.

In Deutschland hatten die Bundesländer zunächst 50 Millionen Impfdosen bestellt. Im Januar einigten sie sich mit Pharmakonzern Glaxo-Smith-Kline (GSK) auf eine Reduzierung der Lieferung auf 34 Millionen Dosen. Da dies aber immer noch mehr als nötig ist, versucht Deutschland nun, den Rest an andere Länder zu verkaufen. In Frankreich wurden 80 Millionen Dosen bestellt, von denen nur ein kleiner Teil verwendet wurden. Auch Paris sucht nach Käufern für seinen überflüssigen Impfstoff.

Channel 4 News exposes Swine Flu Scandal

YouTube, 11 March 2010
https://www.youtube.com/watch?v=Gs-DBOFWCpc

Channel 4's John Snow reports on the Council of Europe's investigation into the manufactured swine flu hoax. The former Chair of the Sub-committee on Health of the Parliamentary Assembly Dr Wolfgang Wodarg had accused the World Health Organization (WHO) of lowering the definition of a pandemic in order for the pharmaceutical companies and their share holders to rake in massive at the expense of tax payers in targeted countries.

L'OMS dément toute influence du secteur pharmaceutique

RTBF Info, 14 avril 2010, 18:04
https://web.archive.org/web/20100417163022/http://www.rtbf.be/info/economie/h1n1-des-experts-de-loms-dementent-toute-influence-du-secteur-pharmaceutique-206750

Des experts ayant joué un rôle prépondérant dans la gestion par l'Organisation mondiale de la Santé (OMS) de la grippe pandémique H1N1 ont démenti mercredi à Genève avoir formulé leurs recommandations sous l'influence des laboratoires pharmaceutiques.

David Salisbury, président du Groupe de conseil stratégique sur la vaccination (SAGE), a avancé que les scientifiques conseillant l'OMS sur la grippe avaient pris "méticuleusement soin" d'éviter tout conflit d'intérêt et de maintenir leurs distances avec le secteur pharmaceutique. Il a rappelé que chaque expert siégeant dans le groupe avait dû remplir une déclaration assurant qu'il n'avait pas travaillé pour des entreprises ou institutions pouvant influencer son travail. "Il n'y a eu de déclaration indiquant qu'il y avait un conflit (d'intérêts) d'aucun membre de SAGE dans notre traitement du vaccin contre le H1N1", a-t-il affirmé devant un comité d'experts chargé d'évaluer la gestion internationale de la première pandémie du XXIe siècle.

Le comité SAGE avait remis au printemps 2009 à la directrice générale de l'OMS, Margaret Chan, ses instructions techniques sur l'opportunité de produire un vaccin contre le virus, la date à laquelle la fabrication devait commencer et en quelles quantités. L'OMS est accusée, notamment par des parlementaires du Conseil de l'Europe, d'avoir exagéré la menace sous l'influence des laboratoires pharmaceutiques, ce qui aurait poussé les gouvernements à acheter bien plus de vaccins que nécessaire.

WHO Investigation of H1N1 Pandemic Proves a Whitewash

Natural News, 19 April 2010
https://www.naturalnews.com/028604_H1N1_pandemic.html

The World Health Organization (WHO) reported that it will be appointing an "independent" committee to investigate the conduct of WHO in the H1N1 swine flu panic of 2009. The investigation is meant to decide whether the actions of WHO were warranted - specifically the declaration of a pandemic. Margaret Chan, Director-General of WHO, called for a "frank, critical, *transparent*, credible and independent review" (emphasis added) and then proceeded to a *closed-door meeting* to begin proceedings.[1]

It is what will obviously be yet another whitewash where a governmental organization investigates itself and eventually comes to a foregone conclusion. In this case, just looking at the appointees tells you what the ultimate outcome of this "independent" investigation will be.

One of the committee members is Dr. John Mackenzie. Mackenzie has direct links with various vaccine and pharmaceutical companies and was influential in the WHO declaration of a level 6 pandemic in 2009.[2] No conflicts of interest there.

Of course, Dr. Mackenzie will not have any foregone conclusions in his part in the investigation of WHO's actions. That is, unless you think he lied in Der Spiegel[3] last month when he said "I think we did everything right."

Others aren't quite as sure as Mackenzie is. The Council of Europe criticized the way WHO handled the swine flu pandemic. Paul Flynn (United Kingdom representative) declared that "A pandemic cannot be whatever the WHO declares it is. If it turns out that former PACE [Parliamentary Assembly of the Council of Europe] member Wolfgang Wodarg was right when he said the pandemic was decided to help the pharmaceutical industry make bigger profits, this might well turn out to be one of the biggest health scandals ever."[4]

This is no small accusation. Not only did WHO change the definition of a "pandemic" just before declaring H1N1 to be one,[5] but also this new internal investigation happens right as the Council of Europe is in the middle of close hearings on their own investigation into WHO and how the pandemic was conducted.

Of course, Natural News and Mike Adams were quick to inform readers of the swine flu lie and make it clear that the pandemic was just another hoax to sell vaccines and pharmaceuticals. While WHO estimated that there would be two billion infections of H1N1 and millions of deaths, in reality the 2009 flu season was milder than normal with few infections and very few deaths.

The WHO whitewash will undoubtedly conclude that they did nothing wrong and were merely incorrect in their estimations. They'll likely pat themselves on the back for getting the word out and doing their part to convince so many millions of people to take the experimental vaccines their friends in Big Pharma cooked up for the event.

Deborah Cohen, Philip Carter

Conflicts of interest. **WHO and the pandemic flu "conspiracies"**

BMJ, 3 June 2010; 340: c2912.
doi: https://doi.org/10.1136/bmj.c2912

Key scientists advising the World Health Organization on planning for an influenza pandemic had done paid work for pharmaceutical firms that stood to gain from the guidance they were preparing. These conflicts of interest have never been publicly disclosed by WHO, and WHO has dismissed inquiries into its handling of the A/H1N1 pandemic as "conspiracy theories." Deborah Cohen and Philip Carter investigate

Next week marks the first anniversary of the official declaration of the influenza A/H1N1 pandemic. On 11 June 2009 Dr Margaret Chan, the director general of the World Health Organization, announced to the world's media: "I have conferred with leading influenza experts, virologists, and public health officials. In line with procedures set out in the International Health Regulations, I have sought guidance and advice from an Emergency Committee established for this purpose. On the basis of available evidence, and these expert assessments of the evidence, the scientific criteria for an influenza pandemic have been met…The world is now at the start of the 2009 influenza pandemic."

It was the culmination of 10 years of pandemic preparedness planning for WHO – years of committee meetings with experts flown in from around the world and reams of draft documents offering guidance to governments. But one year on, governments that took advice from WHO are unwinding their vaccine contracts, and billions of dollars' worth of stockpiled oseltamivir (Tamiflu) and zanamivir (Relenza) – bought from health budgets already under tight constraints – lie unused in warehouses around the world.

A joint investigation by the BMJ and the Bureau of Investigative Journalism has uncovered evidence that raises troubling questions about how WHO managed conflicts of interest among the scientists who advised its pandemic planning, and about the transparency of the science underlying its advice to governments. ...

Conflicts of interest and pandemic flu

BMJ. 2010 Jun 3; 340:c2947
doi: 10.1136/bmj.c2947. PMID: 20525680

WHO must act now to restore its credibility, and Europe should legislate

The world should of course be thankful that the 2009 influenza A/H1N1 pandemic proved such a damp squib. With so many fewer lives lost than had been predicted, it almost seems ungrateful to carp about the cost. But carp we must because the cost has been huge. Some countries – notably Poland – declined to join the panic buying of vaccines and antivirals triggered when the World Health Organization declared the pandemic a year ago this week. However, countries like France and the United Kingdom who have stockpiled drugs and vaccines are now busy unpicking vaccine contracts, selling unused vaccine to other countries, and sitting on huge piles of unused oseltamivir. Meanwhile drug companies have banked vast profits – \$7bn (£4.8bn; €5.7bn) to \$10bn from vaccines alone according to investment bank JP Morgan.1 Given the scale of public cost and private profit, it would seem important to know that WHO's key decisions were free from commercial influence.

An investigation by the *BMJ* and the Bureau of Investigative Journalism, published this week (doi:10.1136/bmj.c2912), finds that this was far from the case.2 As reported by Deborah Cohen and Philip Carter, some of the experts advising WHO on the pandemic had declarable financial ties with drug companies that were producing antivirals and influenza vaccines. As an example, WHO's guidance on the use of antivirals in a pandemic was authored by an influenza expert who at the same time was receiving payments from Roche, the manufacturer of oseltamivir (Tamiflu), for consultancy work and lecturing. Although most of the experts consulted by WHO made no secret of their industry ties …

Investigation Raises Questions About WHO's Handling of Pandemic

MedPage, 4 June 2010
https://www.medpagetoday.com/infectiousdisease/swineflu/20473

Experts advising the World Health Organization on pandemic influenza and writing some of its guidance did not disclose their financial ties to the pharmaceutical industry, according to an investigative report in the *BMJ*.

Some of the paid relationships involved companies that made antivirals and vaccines and were positioned to benefit financially from preparations for a flu pandemic, reported Deborah Cohen, features editor of *BMJ*, and Philip Carter, a journalist with the Bureau of Investigative Journalism in London.

The conflicts of interest were never publicly disclosed by WHO, according to the report, which was featured under the headline, "Did the drug industry influence WHO's decisions about the swine flu pandemic?"

The investigation "has uncovered evidence that raises troubling questions about how WHO managed conflicts of interest among the scientists who advised its pandemic planning, and about the transparency of the science underlying its advice to governments," Cohen and Carter wrote.

Although they said that "experts need to work with industry to develop the best possible drugs for illnesses," they argued that "questions remain about what level of involvement experts with industry ties should have in the formulation of public health policy."

The U.S. Department of Health and Human Services came to WHO's defense, issuing the following statement: "The WHO handled the outbreak in a very measured and appropriate manner. Their decisions were driven by the existing and evolving conditions at the time and what the best scientific information was telling us. It's very easy to look back through a 20-20 lens and essentially be an armchair quarterback."

Addressing the possibility of industry influence on WHO's decisions, the HHS spokesman said, "The WHO based its decisions on strong public health considerations, and I don't think there was any indication from our perspective that their decisions were influenced by industry in any way."

The H1N1 pandemic, which will mark its one year anniversary on June 11, "could, of course, have been far worse," Cohen and Carter wrote. "Planning for the worst while hoping for the best remains a sensible approach. But our investigation has revealed damaging issues. If these are not addressed, H1N1 may yet claim its biggest victim -- the credibility of the WHO and the trust in the global public health system."

Second Report Adds to Controversy

A report from the Council of Europe Parliamentary Assembly published on the same day the *BMJ* report was released called into question WHO's handling of the H1N1 pandemic. That inquiry was led by Paul Flynn, a British member of parliament.

A provisional version of the report stated, "The Parliamentary Assembly is alarmed about the way in which the H1N1 influenza pandemic has been handled, not only by the World Health

Organization (WHO), but also by the competent health authorities at the level of the European Union and at the national level."

"It is particularly troubled by some of the consequences of decisions taken and advice given leading to distortion of priorities of public health services across Europe, waste of large sums of public money, and also unjustified scares and fears about health risks faced by the European public at large," it stated.

The report also addressed the transparency issues raised by Cohen and Carter, "which have generated concerns about the possible influence of the pharmaceutical industry on some of the major decisions relating to the pandemic."

Experts Dispute Charges

Experts contacted about the BMJ report disputed the insinuation that researchers' financial ties to industry influenced WHO's decision-making surrounding pandemic influenza in general and the H1N1 pandemic specifically.

"I do find these investigations troubling, when the only way WHO could be exonerated is if there had been tens of millions dead," said **John Barry**, a distinguished scholar at Tulane University and author of *The Great Influenza*. "And then we'd have investigations about how ineffective they were." "While I agree WHO should have disclosed any relationship between advisers and industry," he continued, "based on what WHO actually did, I find it absurd to accuse them of having been influenced by the drug industry. Antivirals, though hardly a magic bullet, are the only drug option. And a recommendation to stockpile them was the only option."

Addressing concerns that the pandemic was declared to profit pharmaceutical companies, Barry said that "if anything, WHO was slow to make that call. And if you know anything about the history of the influenza virus, again it had no option. 1918 saw a very mild spring wave, quite comparable to what we experienced in 2009. It turned virulent months later."

John Treanor, MD, a vaccine expert at the University of Rochester Medical Center, in Rochester, N.Y., agreed that WHO's preparations were justified.

"I think even the authors [of the *BMJ* report] would have to agree that there really was no choice here but to prepare for a pandemic," he said. "If there had been a severe pandemic and there had been no preparations, the outcome (and the outcry) would have been far worse."

Although some of the WHO's advisers received compensation from manufacturers of the same antivirals and vaccines recommended for use during the H1N1 pandemic, Treanor noted that there are few options available for combating influenza.

"You can tweak the plans -- how much antivirals, what kinds, where is the vaccine coming from, who should be vaccinated first, should you close schools, etc. -- but the basic elements are going to be the same," he said. "So I don't see the argument here as whether WHO made the right recommendation at the time, regardless of who was advising them -- they clearly did."

One researcher, **Henry Miller**, MD, criticized WHO for mistakes made, including the declaration of a pandemic for H1N1 influenza in the first place. However, "the stockpiling of anti-flu medicines and the production of vaccine weren't among them," said Miller, a biotechnology expert at Stanford University's Hoover Institution.

"Much of the criticism of WHO as having been unduly influenced by industry seems to be coming from anti-industry NGOs [nongovernmental organizations]," Miller said.

Planning Began in 1999

Cohen and Carter detailed WHO's pandemic influenza preparation starting in 1999, when a preparedness plan was drafted by six researchers in collaboration with the European Scientific

Working Group on Influenza (ESWI). Over the next decade, according to their investigation, WHO failed to disclose industry ties among researchers advising the organization.

The document drafted in 1999 did not include information on conflicts of interest. Cohen and Carter pointed out that ESWI is funded entirely by Roche, which makes oseltamivir (Tamiflu), and that two of the authors of the document had participated in Roche-sponsored events in the previous year. Both were also involved in a randomized controlled trial of oseltamivir supported by the company.

In 2002, WHO called together flu experts to craft guidelines for the use of vaccines and antivirals during an influenza pandemic. The panel included representatives of Roche and Aventis Pasteur (now Sanofi-Pasteur), which makes flu vaccine, and three experts who had been named in marketing material for oseltamivir.

The resulting report, which advised stockpiling antivirals, was published in 2004, and the main author, Frederick Hayden, MD, of the University of Virginia in Charlottesville, confirmed that he was being paid by Roche for lectures and consulting when the report was produced and published.

Conflicts Not Disclosed

Several additions to the report did not include information about conflicts of interest, according to Cohen and Carter.

"WHO has failed to provide any details about whether such conflicts were declared by the relevant experts and what, if anything, was done about them," they wrote.

"Leaving aside the question of what declarations experts made to WHO, one simple fact remains: WHO itself did not publicly disclose any of these conflicts of interest when it published the 2004 guidance," Cohen and Carter wrote. "It is not known whether information about these conflicts of interest was relayed privately to governments around the world when they were considering the advice contained in the guidelines."

Conflicts of interest were similarly not disclosed in updated plans made in the following years, they said. "No public declarations of interest have been made and to date no details have been provided by WHO in response to our requests," Cohen and Carter wrote.

Compounding this lack of transparency is the fact that the 16 members of the emergency committee that has been advising WHO during the H1N1 pandemic have remained anonymous, at least officially. The chair is known to be John MacKenzie of Curtin University in Perth, Australia.

The *BMJ* investigation turned up another three members, including Arnold Monto, MD, of the University of Michigan School of Public Health; John Wood, PhD, of the National Institute for Biological Standards and Control in the U.K.; and Masato Tashiro, MD, PhD, director of the WHO collaborating center for surveillance and research on influenza in Tokyo.

Wood and Tashiro said they have no conflicts of interest, but Monto has received speakers' fees from GlaxoSmithKline, maker of zanamivir (Relenza).

Anonymity Stance Questioned

In a statement, WHO's secretary-general Margaret Chan, MD, MPH, said the purpose of keeping the committee members anonymous "is to protect the integrity and independence of the members while doing this critical work – but also to ensure transparency by publicly providing the names of the members as well as information about any interest declared by them at the appropriate time."

"This is a troubling stance," Fiona Godlee, MBBChir, editor-in-chief of the *BMJ*, wrote in an accompanying editorial. "It suggests that WHO considers other advisory groups whose members are not anonymous – such as the Strategic Advisory Group of Experts on Immunization – to be potentially subject to outside influences, and it allows no scrutiny of the scientists selected to advise WHO and global governments on a major public health emergency."

"Given the scale of public cost and private profit, it would seem important to know that WHO's key decisions were free from commercial influence," Godlee said. The investigation "finds that this was far from the case."

She said the recovery of the WHO's damaged credibility "will be fastest if it publishes its own report without delay or defensive comment, makes public the membership and conflicts of interest of its emergency committee, and develops, commits to, and monitors stricter rules of engagement with industry that keep commercial influence away from its decision-making."

Balancing Act Called For

According to the University of Rochester's **Treanor**, the important issue to consider is not whether WHO made the right decisions about the H1N1 pandemic – because he believes they made the right recommendations at the time -- but "the much more tricky and generic question about how to appropriately separate the interests of the pharmaceutical industry from the interests of public health, while at the same time being able to take advantage of existing expertise on the issues, the bulk of which resides in individuals with some kind of ties to industry."

"In our current system of healthcare," Treanor said, "the responsibility for demonstrating that these interventions are safe and effective lies with the manufacturer. Hence, individuals with the greatest experience and insight into these interventions will almost always either be employees of industry or individuals paid by industry to conduct studies."

When evaluating advice from a panel of experts, he said it's important to consider the fact that researcher's will always view the products they do work on in a positive light, even if they weren't paid by industry. "After all," Treanor said, "it's much more fun to be involved in the development of an effective product than one that doesn't work."

According to **John Bartlett**, MD, founding director of the Center for Civilian Biodefense Strategies at Johns Hopkins, the fact that conflicts of interest are prevalent among influenza experts "is not at all surprising to me since the people in medicine who know most about flu are often conflicted because they also are advisers to pharma and often do the big trials that are funded by pharma."

He said he is not an authority on influenza, but that "the colleagues I know who do this work often/usually have these connections, but that is usually good for better pharma and good for better WHO advice."

Harvey V. Fineberg, MD, PhD, president of the Institute of Medicine, chairs the WHO committee to review management of the H1N1 pandemic and functioning of the International Health Regulations.

Today, following publication of the reports by *BMJ* and the Parliamentary Assembly of the Council of Europe, Dr. Fineberg released the following statement: "Our review committee welcomes the opportunity to learn from reports published today by the *British Medical Journal* and released by the Social, Health and Family Affairs Committee of the Parliamentary Assembly of the Council of Europe (PACE).

These reports raise questions about potential, inappropriate influences on WHO decision-making in the assessment and response to the 2009 H1N1 pandemic and, more generally, question practices employed by WHO to guard against conflict of interest among its expert advisers. These topics are among those that will be fully considered by our review committee. At our upcoming meeting in Geneva (30 June to 2 July 2010) we anticipate hearing from critics of WHO as well as from those who were involved from the public and private sectors, at national and international levels, and in policy and decision-making related to the H1N1 pandemic."

...

Carter reported no conflicts of interest. Cohen reported being paid expenses by WHO for giving talks at two conferences.

Godlee reported writing articles on the challenges faced by WHO and on the influence of the drug industry. She reported being in favor of a more assertive approach to conflict of interest and supporting efforts to control the influence of the drug industry on medical research, medical education, and health policy.

Treanor made the following disclosure: "I am very significantly funded by industry to perform studies of experimental vaccines. This funding is in the form of contracts to my institution for my lab to conduct lab assays or for my clinical staff to enroll subjects and follow them in a variety of clinical studies. The sponsors of these studies currently include Protein Sciences Corporation, Bavarian Nordic, GlaxoSmithKline, Pfizer, Sanofi-Pasteur, Vaxinnate, Mercia Pharma, Paxvax, and Ligocyte. I am also considering attending a scientific advisory board for Novartis, for which I would receive an honorarium, and I am on the scientific advisory board for Immune Targeting Systems (ITS) and also received an honorarium last year from Abbott for an advisory meeting. We also conduct clinical trials of experimental live vaccines through a contract with NIH, but the vaccines are supplied by MedImmune through a cooperative research and development agreement (CRADA) with NIAID."

Barry reported giving a talk, hosted by Gilead, which developed oseltamivir, four years ago to public health leaders and individuals from the biotechnology industry. He received an honorarium. "I'm sure Gilead paid some and possibly all of that fee. I never had any relationship with them," Barry said.

Bartlett said he is not connected to any pharmaceutical company with an interest in influenza.

Miller reported no conflicts of interest.

Deborah Cohen and Philip Carter

WHO and the pandemic flu "conspiracies"

BMJ, 4 June 2010; 340: c2912 (1274-1279); doi: https://doi.org/10.1136/bmj.c2912
https://www.bmj.com/content/340/bmj.c2912

Key scientists advising the World Health Organization on planning for an influenza pandemic had done paid work for pharmaceutical firms that stood to gain from the guidance they wrote. These conflicts of interest have never been publicly disclosed by WHO. Deborah Cohen and Philip Carter investigate.

This week marks the first anniversary of the official declaration of the influenza A/H1N1 pandemic. On 11 June 2009 Dr Margaret Chan, the director general of the World Health Organization, announced to the world's media: "I have conferred with leading influenza experts, virologists, and public health officials. . . I have sought guidance and advice from an Emergency Committee established for this purpose. On the basis of available evidence, and these expert assessments of the evidence, the scientific criteria for an influenza pandemic have been met. . . The world is now at the start of the 2009 influenza pandemic."

It was the culmination of 10 years of pandemic preparedness planning for WHO – years of committee meetings with experts flown in from around the world and reams of draft documents offering guidance to governments. But one year on, governments that took advice from WHO are unwinding their vaccine contracts, and billions of dollars' worth of stockpiled oseltamivir (Tamiflu) and zanamivir (Relenza) – bought from health budgets already under tight constraints – lie unused in warehouses around the world.

A joint investigation by the BMJ and the Bureau of Investigative Journalism has uncovered evidence that raises troubling questions about how WHO managed conflicts of interest among the scientists who advised its pandemic planning, and about the transparency of the science underlying its advice to governments. Was it appropriate for WHO to take advice from experts who had declarable financial and research ties with pharmaceutical companies producing antivirals and influenza vaccines? Why was key WHO guidance authored by an influenza expert who had received payment for other work from Roche, manufacturers of oseltamivir, and GlaxoSmithKline, manufacturers of zanamivir? And why does the composition of the emergency committee from which Chan sought guidance remain a secret known only to those within WHO? We are left wondering whether major public health organisations are able to effectively manage the conflicts of interest that are inherent in medical science.

Already WHO's handling of the pandemic has led to an unprecedented number of reviews and inquiries by organisations including the Council of Europe, European Parliament, and WHO itself, following allegations of industry influence. Dr Chan has dismissed these as "conspiracies," and earlier this year, during a speech at the Centers for Disease Control and Prevention in Atlanta, she said: "WHO anticipated close scrutiny of its decisions, but we did not anticipate that we would be accused, by some European politicians, of having declared a fake pandemic on the advice of experts with ties to the pharmaceutical industry and something personal to gain from increased industry profits."

The inquiry by British MP Paul Flynn for the Council of Europe Parliamentary Assembly – published last week – was critical. It said that decision making around the A/H1N1 crisis has been

lacking in transparency. It pointed to distortion of priorities of public health services, a waste of huge sums of public money, provocation of unjustified fear, and the creation of health risks through vaccines and medications which might not have been sufficiently tested before being authorised in fast-track procedures. “These results need to be critically examined by public health authorities at all levels with a view to rebuilding public confidence in their decisions,” it said.

The investigation by the BMJ/The Bureau reveals a system struggling to manage the inherent conflict between the pharmaceutical industry, WHO, and the global public health system, which all draw on the same pool of scientific experts. Our investigation has identified key scientists involved in WHO pandemic planning who had declarable interests, some of whom are or have been funded by pharmaceutical firms that stood to gain from the guidance they were drafting. Yet these interests have never been publicly disclosed by WHO and, despite repeated requests from the BMJ/The Bureau, WHO has failed to provide any details about whether such conflicts were declared by the relevant experts and what, if anything, was done about them.

WHO says: “Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and a profit-driven industry. Similar considerations apply when experts advising the Organization have professional links with pharmaceutical companies. Numerous safeguards are in place to manage possible conflicts of interest or their perception.”

But a lack of transparency over conflicts of interests – coupled with a documented changing of the definition of a pandemic and unanswered questions over the evidence base for therapeutic interventions[1] – has led to the emergence of these conspiracies.

Another factor that has fuelled the conspiracies is the manner in which risk has been communicated. No one disputes the difficulty of communicating an uncertain situation or the concept of risk in a pandemic situation. But one world expert in risk communication, Gerd Gigerenzer, director of the Centre for Adaptive Behaviour and Cognition at the Max Planck Institute in Germany, told the BMJ/The Bureau: “The problem is not so much that communicating uncertainty is difficult, but that uncertainty was not communicated. There was no scientific basis for the WHO’s estimate of 2 billion for likely H1N1 cases, and we knew little about the benefits and harms of the vaccination.

The WHO maintained this 2 billion estimate even after the winter season in Australia and New Zealand showed that only about one to two out of 1000 people were infected. Last but not least, it changed the very definition of a pandemic.”

WHO for years had defined pandemics as outbreaks causing “enormous numbers of deaths and illness” but in early May 2009 it removed this phrase – describing a measure of severity – from the definition.[2]

Routes to the Council of Europe’s criticisms can be traced back to 1999, a pivotal year in the influenza world. In April that year WHO – spurred on by the 1997 chicken flu outbreak in Hong Kong – began to organise itself for a pandemic. It drew up a key document, *Influenza Pandemic Plan: The Role of WHO and Guidelines for National and Regional Planning*.

WHO’s first influenza pandemic preparedness plan was stark in the scale of the risk the world faced in 1999: “It is impossible to anticipate when a pandemic might occur. Should a true influenza pandemic virus again appear that behaved as in 1918, even taking into account the advances in medicine since then, unparalleled tolls of illness and death would be expected.”

In the small print of that document it states: “R Snacken, J Wood, L R Haaheim, A P Kendal, G J Ligthart, and D Lavanchy prepared this document for the World Health Organization (WHO), in collaboration with the European Scientific Working Group on Influenza (ESWI).” What this document does not disclose is that ESWI is funded entirely by Roche and other influenza drug manufacturers. Nor does it disclose that René Snacken and Daniel Lavanchy were participating in Roche sponsored events the previous year, according to marketing material seen by the *BMJ*/The Bureau.

Dr Snacken was working for the Belgian ministry of public health when he wrote about studies involving neuraminidase inhibitors for a Roche promotional booklet. And Dr Lavanchy, meanwhile, was a WHO employee when he appeared at a Roche sponsored symposium in 1998. His role at that time was in the WHO Division of Viral Diseases. Dr Lavanchy has declined to comment.

In 1999 other members of the European Scientific Working Group on Influenza included Professor Karl Nicholson of Leicester University, UK, and Professor Abe Osterhaus of Erasmus University in the Netherlands. These two scientists are also identified in Roche marketing material seen by this investigation which was produced between 1998 and 2000. Professor Osterhaus told the BMJ that he had always been transparent about any work he has done with industry. Professor Nicholson similarly has consistently declared his connections with pharmaceutical companies, for example, in papers published in journals such as the *BMJ* and *Lancet*.

Both experts were also at that time engaged in a randomised controlled trial on oseltamivir supported by Roche. The trial was subsequently published in the Lancet in 2000.3 It remains one of the main studies supporting oseltamivir's effectiveness – and one that was subsequently shown to have employed undeclared industry funded ghostwriters.[1]

The influence of the European Scientific Working Group on Influenza would continue as the decade wore on and the calls for pandemic planning became more strident. Founded in 1992, this "multidisciplinary group of key opinion leaders in influenza aims to combat the impact of epidemic and pandemic influenza" and claims links to WHO, the Robert Koch Institute, and the European Centre for Disease Prevention and Control, among others.[4] Despite the group's claims of scientific independence its 100% industry funding does present a potential conflict of interest. One if its roles is to lobby politicians, as highlighted in a 2009 policy document.[5]

At a pre-pandemic preparation workshop of the European Scientific Working Group on Influenza in January last year, Professor Osterhaus said: "I can tell you that ESWI is working on that idea [that is, convincing politicians] quite intensively. We have contact with MEPs [members of the European Parliament] and with national politicians. But it is they who have to decide at the end of the day, and they will only act at the request of their constituencies. If the latter are not prompted, nothing will happen."

The group's policy plan for 2006-10 specifically stated that government representatives needed to "take measures to encourage the pharmaceutical industry to plan its vaccine/antivirals production capacity in advance" and also to "encourage and support research and development of pandemic vaccine" and to "develop a policy for antiviral stockpiling." It also added that government representatives needed to know that "influenza vaccination and use of antivirals is beneficial and safe." It said that the group provided "evidence based, palatable information"; and also "networking/exchange with other stakeholders (eg, with industry in order to establish pandemic vaccine and antivirals contracts)." In the meantime, in Roche's own marketing plan, one goal was to "align Roche with credible third party advocates". They "leveraged these relationships by enlisting our third-party partners to serve as spokespeople and increase awareness of Tamiflu and its benefits".[6]

Tarbara Mintzes, assistant professor in the Department of Pharmacology and Therapeutics at the University of British Columbia, is currently part of a group working with Health Action International and WHO developing curricula for medical and pharmaceutical students on drug promotion and interactions with the industry, including conflicts of interest. She thinks that caution is advised when working with medical bodies of this sort.

"It is legitimate for WHO to work with industry at times. But I would have concerns about involvement with a group that looks like it is for independent academics that is actually mainly industry funded," she said, adding: "The Institute of Medicine has raised concerns about the need to have a firewall with medical groups. To me this does not sound like an independent group, as it is mainly funded by manufacturers."

She also thinks that there is a difference between the conflict of interest in having a clinical trial funded by a company and the conflict of interest in being involved in marketing a drug – for example, on a paid speakers bureau or in marketing material. “Some academic medical departments, for example Stanford University, have banned staff from being involved in marketing or being on a paid speakers bureau,” she said.

The presence of leading influenza scientists at promotional events for oseltamivir reflected not just the concern of an impending pandemic, but the excitement over the potential of a new class of drugs – neuraminidase inhibitors – to offer treatment and protection against seasonal influenza.

In 1999 two new drugs first came to market: oseltamivir, from Roche; and zanamivir, manufactured by what is now GlaxoSmithKline. The two drugs would battle it out over the coming years, with oseltamivir – aided by its oral administration – trumping its rival in global sales as the decade wore on.

The potential was quickly grasped. Indeed, that year Professor Osterhaus published an article proposing the use of neuraminidase inhibitors in pandemics: “Finally, during a possible future influenza pandemic, in view of their broad reactivity against influenza virus neuraminidase subtypes and the expected lack of sufficient quantities of vaccine, the new antivirals will undoubtedly have an essential role to play in reducing the number of victims”.[7]

He also warned that antivirals should not be seen as a replacement for vaccinations. “Close collaboration and consultation between, on the one hand, companies marketing influenza vaccines and, on the other, those marketing antivirals will therefore be absolutely essential. It is important that a clear and uniform message indicating the complementary roles of vaccines and antivirals is delivered.”

That article appeared in the European Scientific Working Group on Influenza’s bulletin of April 1999; Professor Osterhaus signs off with the affiliation of WHO National Influenza Centre Rotterdam, The Netherlands. Other experts soon followed suit – recommending the role neuraminidase inhibitors could play in any future pandemic – in both the academic literature and in the general media.

Food and Drug Administration

While the excitement over these drugs fuelled scientific symposiums, the US Food and Drug Administration (FDA) was less than convinced. The *BMJ*/The Bureau has since spoken to people from within the American and European drug regulators, the FDA and the European Medicines Agency (EMEA), who said that both regulators struggled with the paucity of the data presented to them for zanamivir and oseltamivir, respectively, during the licensing process. At the end of last year, the BMJ called for access to raw data for key public health drugs after the Cochrane Collaboration found the effectiveness of the drugs impossible to evaluate.[8] The group are continuing to negotiate access to what they say they need to fully assess the effectiveness of antivirals.

In the US, the FDA first approved zanamivir in 1999.[9] Michael Elashoff, a former employee of the FDA, was the statistician working on the zanamivir account. He told the *BMJ* how the FDA advisory committee initially rejected zanamivir because the drug lacked efficacy.

After Dr Elashoff’s review (he had access to individual patient data and summary study reports) the FDA’s advisory committee voted by 13 to 4 not to approve zanamivir on the grounds that it was no more effective than placebo when the patients were on other drugs such as paracetamol. He said that it didn’t reduce symptoms even by a day.

“When I was reviewing the data, I tried to replicate the analyses in their summary study reports. The issue was not of data quality, but sensitivity analyses showed even less efficacy,” he said. “The safety analysis showed there were safety concerns, but the focus was on if Glaxo had demonstrated efficacy.” Dr Elashoff’s view was that zanamivir was no better than placebo – and it had side effects. And when the FDA medical reviewer made a presentation, her conclusion was that it could either be approved or not approved. It was a fairly borderline drug.

There were influenza experts on the FDA's advisory committee and much of the discussion hinged on why a drug that looked so promising in earlier studies wasn't working in the largest trials in the US. One hypothesis was that people in the US were taking other drugs for symptomatic relief that masked any effect of zanamivir. So zanamivir might have no impact on symptoms over and above the baseline medications that people take when they have influenza.

Two other trials – one in Europe and one in Australia – showed a bit more promise. But there was a very low rate of people taking other medications.

"So in the context of not being allowed to take anything for symptomatic relief, there might be some effect of Relenza. But in the context of a typical flu, where you have to take other things to manage your symptoms, you wouldn't notice any effect of Relenza over and above those other things," Dr Elashoff said. The advisory committee recommended that the drug should not be approved.

Nevertheless, FDA management decided to overturn the committee's recommendation.

"They would feel better if there was something on the market in case of a pandemic. It wasn't a scientific decision," Dr Elashoff said.

While Dr Elashoff was working on the zanamivir review, he was assigned the oseltamivir application. But when the review and the advisory committee decided not to recommend zanamivir, the FDA's management reassigned the oseltamivir review to someone else. Dr Elashoff believes that the approval of zanamivir paved the way for oseltamivir, which was approved by the FDA later that year.

In Europe the EMEA was similarly troubled by the evidence for oseltamivir. By early 2002 Roche had sought a European Union-wide licence from the EMEA. It was a lengthy process, taking three meetings of the Committee for Medicinal Products for Human Use as well as expert panels, according to one of the two rapporteurs, Pekka Kurki of the Finnish Medicines Agency. Echoing the Cochrane Collaborations's 2009 findings6 Kurki told us: "We discussed the same issues that are still discussed today: does it show clinically significant benefits in treatment and prophylaxis of flu and what was the magnitude of the benefits presented in the RCTs? Our assessment and Cochrane's in 2009 are very similar with regard to the effect size in RCTs. The data show that the effects of Tamiflu were clear but not very impressive.

"What was unclear and is still unclear is what is the impact of Tamiflu on serious complications. Circulating influenza was very mild when Tamiflu was developed and therefore it is very difficult to say anything about serious complications. The data did not clearly show an effect on serious complications – it was not demonstrated by the RCTs."

In documents obtained under the freedom of information legislation, two of the experts who provided opinions during the EMEA licensing process have also featured in Roche marketing material: Annike Linde and Rene Snacken. In Dr Snacken's EMEA presentation dated 18 February 2002, he discussed the need for chemoprophylaxis and called for the use of oseltamivir during a pandemic. He made his presentation as a representative of the Belgian Ministry of Public Health. At the time Dr Snacken was also "liaison officer" for the European Scientific Working Group on Influenza. He also played a key role in the Belgian government during its pandemic planning, and he later became a senior expert at the Preparedness and Response Unit, European Centre for Disease Prevention and Control.

Annike Linde has confirmed in an email that she has had connections with Roche over a number of years. She made a presentation to the EMEA on "influenza surveillance" in her capacity as a representative of the Swedish Institute for Infectious Disease. Again, it is not clear what, if anything, she declared to the EMEA concerning her previous relationship with Roche.

Dr Linde, now the Swedish state epidemiologist, has told the *BMJ*/The Bureau that she received payments from Roche International in respect of various pieces of work she did for the company until 2002. She has subsequently given occasional lectures for Roche Sweden. All money she has received from Roche was given, Dr Linde says, to the Swedish Institute for Infectious Disease Control.

We asked the scientists whether they declared their relationship with Roche at the time to the EMEA. Neither has answered that question entirely satisfactorily. Dr Snacken has not replied to repeated emails posing this question. Dr Linde responded by telling the BMJ/The Bureau: "We contribute with our expertise to the regulatory agencies when asked. When we do so, a declaration of interest, where e.g. participation at advisory meetings at Roche, is given and evaluated by the regulatory agency." The *BMJ*/The Bureau requested Linde and Snacken's declaration of interest statements for the 2002 meeting from the EMEA unider the Freedom of Information Act. The EMEA was unable to provide statements for those particular people at that time.

Developing the guidelines

In October 2002 WHO convened a meeting of influenza experts at its Geneva headquarters. Their purpose was to develop WHO's guidelines for the use of vaccines and antivirals during an influenza pandemic.

Included at this meeting were representatives from Roche and Aventis Pasteur and three experts who had lent their name to oseltamivir's marketing material (Professors Karl Nicholson, Albert Osterhaus, and Fred Hayden).

Two years later the WHO published a key report from that meeting, *WHO Guidelines on the Use of Vaccines and Antivirals during Influenza Pandemics 2004*. The specific guidance on antivirals, *Considerations for the Use of Antivirals During an Influenza Pandemic*, was written by Fred Hayden. Professor Hayden has confirmed to the *BMJ*/The Bureau in an email that he was being paid by Roche for lectures and consultancy work for the company at the time the guidance was produced and published. He also told us in an email that he had received payments from GlaxoSmithKline for consultancy and lecturing until 2002. According to Prof Hayden: "DOI [declaration of interest] forms were filled out for the 2002 consultation."

The WHO guidance concluded that: "Based on their pandemic response goals and resources, countries should consider developing plans for ensuring the availability of antivirals. Countries that are considering the use of antivirals as part of their pandemic response will need to stockpile in advance, given that current supplies are very limited." Many countries around the world would adopt this guidance.

The previous year Professor Hayden was also one of the main authors of a Roche sponsored study that claimed what was to become one of oseltamivir's main selling points – a claimed 60% reduction in hospitalisations from flu, which the Cochrane Collaboration was later unable to verify.[8]

Our investigation has also identified relevant and declarable interests relating to the two other named authors of annexes to WHO's 2004 guidelines. Arnold Monto was the author of the annexe dealing with vaccine usage in pandemics. Between 2000 and 2004 – and at the time of writing the annexe – Dr Monto had openly declared honorariums, consultancy fees, and research support from Roche, 10‑12 consultancy fees and research support from GlaxoSmithKline[10,12-14]; and also research funding from ViroPharma.[15]

No conflict of interest statement was included in the annex he wrote for WHO. When asked if he had signed a declaration of interest form for WHO, Dr Monto told the BMJ/The Bureau: "Conflict of Interest forms are requested before participation in any WHO meeting".

Professor Karl Nicholson is the author of the third annex, Pandemic Influenza. According to declarations made by Professor Nicholson in the *BMJ*[16] and Lancet in 2003,[17] he had received travel sponsorship and honorariums from GlaxoSmithKline and Roche for consultancy work and speaking at international respiratory and infectious diseases symposiums. Before writing the annexe, he had also been paid and declared ad hoc consultancy fees by Wyeth, Chiron, and Berna Biotech.

Even though the previous year these declarations had been openly made in the Lancet and the *BMJ*, no conflict of interest statement was included in the annex he wrote for WHO. Professor Nicholson

told the BMJ/The Bureau that he last had "financial relations" with Roche in 2001. When asked if he had signed a declaration of interest form for WHO, Prof Nicholson replied: "The WHO does require attendees of meetings, such as those held in 2002 and 2004, to complete declarations of interest."

Leaving aside the question of what declarations experts made to WHO, one simple fact remains: WHO itself did not publicly disclose any of these conflicts of interest when it published the 2004 guidance. It is not known whether information about these conflicts of interest was relayed privately to governments around the world when they were considering the advice contained in the guidelines.

The year before WHO issued the 2004 guidance, it published a set of rules on how WHO guidelines should be developed and how any conflicts of interest should be handled. This guidance included recommendations that people who had a conflict of interest should not take part in the discussion or the piece of work affected by that interest or, in certain circumstances, that the person with the conflict should not participate in the relevant discussion or work at all. The WHO rules make provision for the director general's office to allow declarations of interest to be seen if the objectivity of a meeting has been called into question.[18]

The *BMJ*/The Bureau has asked WHO for the conflict of interest declarations for the Geneva 2002 meeting and those related to the guidance document itself. WHO told us that the query went directly up to Margaret Chan's office. "WHO never publishes individual DOIs [declaration of interest], except after consultation with the Office of the Director-General. In this case, we put in a request on your behalf but it was not granted. In more recent years, many WHO committees have published summaries of relevant interests with their meeting reports."

In a BMJ interview (see film on bmj.com), WHO spokesperson Gregory Hartl reiterated the fact that Dr Margaret Chan, "is very committed personally to transparency." Yet her office has turned down repeated requests for declaration of interest statements and declines to comment on the allegations that authors of the guidelines had declarable interests.

Nevertheless, Prof Hayden told the BMJ/The Bureau: "I strongly support transparency in declarations of interest, in part because this allows those reading documents, particularly ones authored by specific individuals (eg, Annexe 5) [the part he wrote], to make their own judgments about the possible relevance of any potential conflicts."

While experts need to work with industry to develop the best possible drugs for illnesses, questions remain about what level of involvement experts with industry ties should have in the formulation of public health policy decisions and guidelines. Professor Nicholson told the *BMJ*/The Bureau: "The WHO and decision makers must be informed of ongoing developments and research findings to ensure that they are as up to date as possible. Some of the most relevant expertise and information are held by companies or individuals with conflicts of interest. I understand the view that experts with conflicts of interest should not advise organisations such as the WHO. But to exclude such people from discussions could deprive WHO and decision makers of important new information."

But not everyone agrees. Barbara Mintzes is unequivocal about what role they should play. "No one should be on a committee developing guidelines if they have links to companies that either produce a product – vaccine or drug – or a medical device or test for a disease. It would be preferable that there are no financial ties when it comes to making big decisions on public health – for example, stockpiling a drug – and that includes if they have a currently funded clinical trial," she said.

She says that one solution is to consult the experts who are involved in industry, but not put them on any decision making committee. "You need a firewall," she added.

Indeed, Professor Harvey Fineberg, president of the Institute of Medicine and chairman of the panel reviewing WHO's pandemic management, takes a similarly hard line. His own institution went through a detailed review of how they interact with industry and experts with conflicts of interests last year.[19] "Sometimes publication of conflict of interests is enough – for example with a journal.

But if you are giving expert judgment to influence policy, revealing is not enough," he told the *BMJ*, referring to the Institute of Medicine's policy.

WHO also says that it takes conflicts of interests seriously and has the mechanisms in place to deal with them. But what action does it take and when does it judge a scientist to be too conflicted to play a leading role in the formulation of global health policy? Since WHO has not provided us with an answer to this question, we are left to guess.

As it stands, this situation is the worst possible outcome for WHO, according to Professor Chris Del Mar, a Cochrane reviewer and expert on WHO's Strategic Advisory Group of Experts on Immunization group. "If it proves to be the case that authors of WHO guidance which promoted the use of certain drugs were being paid at the same time by the makers of those drugs for other work they were doing for these companies that is reprehensible and should be condemned in the strongest possible terms."

WHO's endorsement of oseltamivir was not lost on Roche. In an advert placed by them for the drug in the main conference programme of the European Scientific Working Group on Influenza's 2005 conference in Malta, it says: "Antivirals will initially be the principal medical intervention in a pandemic situation and Roche is working as a responsible partner with governments to assist in their pandemic planning." The source reference for this is the *WHO Global Influenza Preparedness Plan*.

Throughout the following years, WHO would appear to have been inconsistent in how it treated conflicts of interest. Updated pandemic plans would continue to be prepared by experts who openly had work funded and acted as consultants to manufacturers of vaccines and antivirals. WHO produced its influenza preparedness plan in 2005, and in 2006 it constituted an interim Influenza Pandemic Task Force. No public declarations of interest have been made and to date no details have been provided by WHO in response to our requests.

WHO's stance that it does not publish declarations of interest from its experts is far from consistent. It is undermined, for example, by the position WHO adopts in relation to the Strategic Advisory Group of Experts on Immunization, its standing vaccine advisory body. Here, contrary to its approach to pandemic planning advisers, WHO does publish summaries of declarations of interest.

These seeming inconsistencies in WHO's approach to transparency and its handling of conflicts of interest extend into the workings of the Emergency Committee formed last year to advise the director general on the pandemic. The identities of its 16 members are unknown outside WHO. This secret committee has guided WHO pandemic policy since then – including deciding when to judge that the pandemic is over.

WHO says it has to keep the identities secret to protect the scientists. In a phone call to the *BMJ*/The Bureau in March, WHO spokesperson Gregory Hartl explained: "Our general principle is we want to protect the committee from outside influences."

The committee advised the WHO director general on phase changes and temporary recommendations. According to WHO, when the Emergency Committee met to discuss a possible move to a declaration of a pandemic, the meeting additionally included members who represented Australia, Canada, Chile, Japan, Mexico, Spain, the UK, and the US, eight countries that experienced widespread outbreaks at the time.

WHO says all members of the Emergency Committee sign a confidentiality agreement, provide a declaration of interests, and agree to give their consultative time freely, without compensation. However, only one member of the committee has been publicly named: Professor John MacKenzie, who chairs it.

This is a troubling stance: it suggests that WHO considers other advisory groups whose members are not anonymous to be potentially subject to outside influences, and it allows no scrutiny of the scientists selected to advise WHO and global governments on a major public health emergency.

Under the International Health Regulations framework, the membership of the Emergency Committee is drawn from a roster of about 160 experts covering a range of public health areas. This framework provides guidelines about how WHO deals with acute public health risks. The BMJ/The Bureau has identified approximately 15 scientists from the International Health Regulations roster with influenza expertise and has emailed them to ask if they were on the Emergency Committee. However, because of the confidentiality agreements they have signed, these scientists cannot acknowledge their membership of the committee, putting them in an invidious position.

David Salisbury, chair of WHO's Strategic Advisory Group of Experts on Immunization (SAGE) committee at the time of the pandemic and a member of the International Health Regulations, says the secrecy has caused problems for his group even though all of the details of SAGE are in the public domain. "SAGE members came in for unfair personal abuse by journalists," he told the *BMJ*/The Bureau.

"Given the importance of the advice, the transparency of the source of the advice was important. I believe it is necessary to keep confidential the source of advice if revealing details might put individuals at risk, for example when bioterrorism is being discussed. This does not seem to be the case for pandemic flu," he added.

The secrecy of the committee is also fuelling conspiracy theories, particularly around the activation of dormant pandemic vaccine contracts. A key question will be whether the pharmaceutical companies, which had invested around $4bn (£2.8bn, €3.3bn) in developing a vaccine, had supporters inside the emergency committee, who then put pressure on WHO to declare a pandemic. It was the declaring of the pandemic that triggered the contracts.

The *BMJ*/The Bureau can confirm that Dr Monto, Dr John Wood, and Dr Masato Tashiro are members of the Emergency Committee.

Although Dr Monto did not answer the question directly, his Infectious Disease Society of America biography states he is a member.[20]

Last year, according to figures made public in the US by GlaxoSmithKline, Professor Monto received $3000 speakers fees from the company in the period between the second quarter and the last quarter of 2009. As a national official of the Japanese government, Dr Tashiro says that he must "have nothing concerning conflict of interest with private companies." Dr John Wood works for the UK National Institute for Biological Standards and Control (NIBSC). Dr Wood, like Dr Tashiro, has no personal conflict of interests but he told the BMJ/The Bureau that as part of its statutory role in developing standards for measurement of biological medicines to ensure accurate dosing and carrying out independent control testing to assure their safety and efficacy, the institute must work closely with the pharmaceutical industry.

"The International Federation of Pharmaceutical Manufacturers and Associations has also made publicly available the nature of their close interaction with NIBSC and similar organisations in order to develop influenza vaccines," he said.[21]

Those who said that they were not on the committee include David Salisbury, Alan Hampson, Albert Osterhaus, Donato Greco, and Howard Njoo. Maria Zambon, from the UK's Health Protection Agency told the BMJ: "I undertake various advisory roles to WHO. Declaration of interest statements are prepared before undertaking such roles.

"The HPA Centre for Infection, as part of its role in national infectious disease surveillance, provision of specialist and reference microbiology and vaccine efficacy monitoring, works closely with vaccine manufacturers and biotechnology companies."

International Health Regulations review

WHO's own review into the operation of the International Health Regulations and WHO's handling of the pandemic is now being conducted by Harvey

Feinberg, president of the US Institute of Medicine, and will report its findings next year. Dr Chan and Professor Feinberg have both made clear the need for a thorough investigation. But questions are already arising about how independent the review will turn out to be. According to the International Health Regulations list in our possession, some 13 of the 29 members of the review panel are members of the International Health Regulations itself and one is the chair of the Emergency Committee. To critics that might suggest a somewhat incestuous approach.

Professor Mintzes does not agree with WHO's explanation that secrecy was needed to protect against the influence of outside interest on decision making. "I can't understand why the WHO kept this secret. It should be public in terms of accountability like the expert advisory committees," she said adding there are other ways of dealing with influence through strong conflict of interest provisions.

She also believes that the very nature of allowing a trigger point for vaccine contracts opens the system up unnecessarily to exploitation. "It seems a problem that this declaration might trigger contracts to be realised. There should be safeguards in place to make sure those with an interest in vaccine manufacturers can't exploit the situation. The WHO will have to look long and hard at this in future," she said.

The number of victims of H1N1 fell far short of even the more conservative predictions by WHO. It could, of course, have been far worse. Planning for the worst while hoping for the best remains a sensible approach. But our investigation has revealed damaging issues. If these are not addressed, H1N1 may yet claim its biggest victim – the credibility of WHO and the trust in the global public health system.

Hayden, Fred, from the University of Virginia, was the author of the key 2004 WHO document arguing for antiviral stockpiling. He was a Roche consultant at the time.

Linde, Annika, Swedish state epidemiologist, has had financial connections to Roche. She gave evidence to the EMEA while linked to Roche. She says she didn't keep any money.

Monto, Arnold, from Michigan University, had declared a financial relationship with Roche, GSK, and ViroPharma. This was not made public by WHO when he wrote its vaccine guidelines.

Nicholson, Karl, from Leicester University, had declared a financial relationship with various drug companies. This was not made clear by WHO when he wrote the Pandemic Influenza annexe.

Snacken, Rene, a Belgian public health official, appeared at Roche promotional events. He helped draft the first WHO pandemic plan and gave evidence to the EMEA about oseltamivir.

*The European Scientific Working Grou*p on Influenza is an industry funded society. It claims links to WHO and the ECDC. It also lobbies governments.

NEWS BBC

WHO swine flu experts 'linked' with drug companies

BBC, 4 June 2010
https://www.bbc.com/news/10235558

Key scientists behind World Health Organization advice on stockpiling of pandemic flu drugs had financial ties with companies which stood to profit, an investigation has found.

The British Medical Journal says the scientists had openly declared these interests in other publications yet WHO made no mention of the links. https://www.bmj.com/content/340/bmj.c2912.extract

It comes as a report from the Council of Europe criticised the lack of transparency around the handling of the swine flu pandemic.

A spokesman for WHO said the drug industry did not influence its decisions on swine flu.

Guidelines recommending governments stockpile antiviral drugs were issued by WHO in 2004.

The advice prompted many countries around the world into buying up large stocks of Tamiflu, made by Roche, and Relenza manufactured by GlaxoSmithKline.

A year after the swine flu pandemic was declared, stocks are left unused in warehouses and governments are attempting to unpick contracts.

Conflict of interest

The BMJ, in a joint investigation with The Bureau of Investigative Journalism, found that three scientists involved in putting together the 2004 guidance had previously been paid by Roche or GSK for lecturing and consultancy work as well as being involved in research for the companies.

Although the scientists involved had freely declared the links in other places and said WHO asked for conflicts of interest forms prior to expert meetings, the ties were not publically declared by WHO.

It is not clear whether these conflicts were notified privately by WHO to governments around the world, the BMJ said, and a request to see conflict of interest declarations was turned down.

In addition, membership of the "emergency committee" which advised WHO's director general Margaret Chan on declaring an influenza pandemic has been kept secret.

It means the names of the 16 committee members are known only to people within WHO, and as such their possible conflicts of interest with drug companies are unknown.

On its website, WHO says: "Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and a profit-driven industry.

"Similar considerations apply when experts advising the Organization have professional links with pharmaceutical companies.

"Numerous safeguards are in place to manage possible conflicts of interest or their perception."

ALJAZEERA

WHO overstated H1N1 threat: Links between WHO experts and drug firms that profited from H1N1 pandemic under scrutiny

Aljazeera, 4 June 2010
https://www.aljazeera.com/economy/2010/6/4/report-who-overstated-h1n1-threat

A joint report into the handling of the H1N1 outbreak has found that some scientists who advised governments to stockpile drugs, had previously been on the payroll of big drug companies.

The report, published in the British Medical Journal, found World Health Organisation (WHO) guidelines on the use of medicine to treat the virus were prepared by experts who had received consulting fees from the top two manufacturers of the drugs – Roche and GlaxoSmithKline.

The WHO's decision to name the flu a "pandemic" is also coming under scrutiny from European investigators, and stands accused of exaggerating the dangers of the H1N1 outbreak, which emerged in April last year.

Laboratory tests have confirmed more than 18,000 deaths from H1N1 infection, according to WHO figures, but the virus has turned out to be less deadly than feared.

Also, symptoms suffered by most people infected with the virus have been mild.

'Exaggerated scare story'

A report by the Council of Europe, also released on Friday, accused the WHO of a lack of transparency over the pandemic announcement – saying it wasted huge sums of money and provoked "unjustified fears".

Paul Flynn, the author of the report, told Al Jazeera that the WHO warnings were "exaggeration on stilts".

"The WHO changed the definition of the most serious pandemic for one that would include the possibility of a tremendous amount of deaths to one that wouldn't include that severity … and this is extraordinary.

"[The] announcement caused the world press to go into hysteria and tell people that we're going to see a plague like the 1918 one.

"There was never any scientific evidence to justify this exaggerated scare story.

"They frightened the world witless about this and caused this vast expense and disruption of health services," he said.

'Saving lives'

But Gregory Hartl, a WHO spokesman in Geneva, said the organisation does not believe any undue influence was exerted on its work.

"In April 2009, we knew very little about [this new virus] and our duty was a duty of care to save lives," he told Al Jazeera.

“So we were helping member states prepare for outcomes that were unknown at the time. We were lucky that afterwards the virus showed itself to be much milder than it was initially thought it could have been.

“Remember what would have happened had WHO and the world done nothing, and it turned out to be a virus on the scale of mortality of bird flu.”

The WHO initially urged rapid development of treatments and vaccines, fearing the virus had the potential to kill millions.

As a result wealthy countries spent billions on medicines which many believe are now unnecessary.

Across Europe, governments are now trying to resell their stockpiles of swine flu vaccine.

Emergency committee

An emergency committee of the WHO has been waiting for signs of how the virus is developing in the southern hemisphere winter before making a full pronouncement on its state.

The committee, composed of 15 external advisers, believes it is critical for countries to maintain vigilance concerning the pandemic, including necessary public-health measures for disease control and surveillance, Margaret Chan, the WHO director-general, has said in a statement.

Chan said that pandemic flu activity was expected to continue, and the committee would meet again by mid-July to review the status of the outbreak once more data from the winter influenza season in the southern hemisphere was available.

The panel met on Tuesday, but Chan delayed any announcement until Thursday as the committee, whose members were spread around the world for the meeting by teleconference, put the final touches to the wording of their recommendation.

Chan’s decision, based on the committee’s recommendation, means that the outbreak, widely known as swine flu, remains at phase six on the WHO’s pandemic scale, which has been at the top level of six since June 2009.

‘Profound misjudment’

WHO experts say the virus remains a threat to some vulnerable people, notably pregnant women, young children and those with respiratory problems, and such groups would continue to need vaccinations.

Fiona Godlee, the editor-in-chief of the British Medical Journal (BMJ), told Al Jazeera the findings were “not surprising” but that the public should be “shocked by this”.

“This was a major decision that affected governments around the world, vast sums of public money and private profit, and we need to really understand exactly the extent to which WHO’s advice was influenced by the pharmaceutical industry,” she said.

“The investigation by the BMJ suggests that there was substantial influence at a number of key stages in the declaration of the pandemic, the definition of the pandemic, the triggering of vaccine contracts around the world and advice to government to stockpile large numbers of expensive antiviral drugs.

“The extent of misjudgment was really very profound in this case.”

But WHO experts maintain that the HIN1 virus could spread easily among people if it were to mutate into a more dangerous or lethal form.

The virus is currently most active in parts of the Caribbean and Southeast Asia, and activity in Africa is low or sporadic.

The Washington Post

Reports accuse WHO of exaggerating H1N1 threat, possible ties to drug makers

The Washington Post, 4 June 2010, 3:52 PM
https://www.washingtonpost.com/wp-dyn/content/article/2010/06/04/AR2010060403034.html
https://web.archive.org/web/20230318052528/https://www.washingtonpost.com/wp-dyn/content/article/2010/06/04/AR2010060403034.html

European criticism of the World Health Organization's handling of the H1N1 pandemic intensified Friday with the release of two reports that accused the agency of exaggerating the threat posed by the virus and failing to disclose possible influence by the pharmaceutical industry on its recommendations for how countries should respond.

The WHO's response caused widespread, unnecessary fear and prompted countries around the world to waste millions of dollars, according to one report. At the same time, the Geneva-based arm of the United Nations relied on advice from experts with ties to drug makers in developing the guidelines it used to encourage countries to stockpile millions of doses of antiviral medications, according to the second report.

The reports outlined the drumbeat of criticism that has arisen, primarily in Europe, of how the world's leading health organization responded to the first influenza pandemic in more than four decades.

"For WHO, its credibility has been badly damaged," wrote Fiona Godlee, the editor of the BMJ, a prominent British medical journal, that published one of the reports. "WHO must act now to restore its credibility."

A spokesman for the WHO, along with several independent experts, however, strongly disputed the reports, saying they misrepresented the seriousness of the pandemic and the WHO's response, which was carefully formulated and necessary given the potential threat.

"The idea that we declared a pandemic when there wasn't a pandemic is both historically inaccurate and downright irresponsible," said WHO spokesman Gregory Hartl in a telephone interview. "There is no doubt that this was a pandemic. To insinuate that this was not a pandemic is very disrespectful to the people who died from it."

The first report, released in Paris, came from the Social, Health and Family Affairs Committee of the Parliamentary Assembly of the Council of Europe, which launched an investigation in response to allegations that the WHO's response to the pandemic was influenced by drug companies that make antiviral drugs and vaccines.

"The parliamentary assembly is alarmed about the way in which the H1N1 influenza pandemic has been handled, not only by the World Health Organization (WHO), but also by the competent health authorities at the level of the European Union and at national level," the 18-page draft report states.

"It is particularly troubled by some of the consequences of decisions taken and advice given leading to distortion of priorities of public health services across Europe, waste of large sums of public money, and also unjustified scares and fears about health risks faced by the European public at large," according to the report.

The second report, a joint investigation by the BMJ and the Bureau of Investigative Journalism, which is based in London, criticized 2004 guidelines the WHO developed based in part on the advice of three experts who received consulting fees from the two leading manufacturers of antiviral drugs used against the virus, Roche and GlaxoSmithKline.

"We are left wondering whether major public health organizations are able to effectively manage the conflicts of interest that are inherent in medical science," the report states.

Hartl dismissed those charges. "WHO would say categorically that it believes that it has not been subject to undue conflict-of-interest. We know that some experts that come to our committees have contact with industry. It would be surprising if they didn't because the best experts are sought by all organizations," Hartl said. "We feel that the guidelines produced were certainly not subject to undue influence."

Several other experts also defended the agency.

"Twenty-twenty hindsight can always second guess the decisions of public health officials," said Jeffrey Levi, executive director of the Trust for America's Health, a private nonprofit group. "But this kind of condemnation of public health officials who made the most prudent decisions based on available knowledge could well backfire in future emergencies: I fear that public health officials will draw the lesson that they should wait for greater scientific certainty before responding in the future – and we could pay for that overcaution with many lives lost."

In response to the criticism, the WHO has launched two investigations, including one by an independent panel of experts led by Harvey Fineberg, who heads the Institute of Medicine at the U.S. National Academy of Sciences.

"These reports raise questions about potential, inappropriate influences on WHO decision-making in the assessment and response to the 2009 H1N1 pandemic and, more generally, question practices employed by WHO to guard against conflict of interest among its expert advisers," Fineberg said in an e-mail. "These topics are among those that will be fully considered by our review committee."

CIDRAP

Robert Roos and Lisa Schnirring

BMJ, European group criticize WHO pandemic actions

CIDRAP, 4 June 2010
http://www.cidrap.umn.edu/cidrap/content/influenza/swineflu/news/jun0410conflict.html

(CIDRAP News) – An article published by the *British Medical Journal* says three scientists who helped frame World Health Organization (WHO) guidance on pandemic influenza preparedness had consulted for pharmaceutical companies that stood to profit from the WHO guidance and that the WHO did not disclose the scientists' industry ties.

The lengthy report, published online yesterday, says the scientists had declared their industry connections in other publications, but the WHO did not reveal them in its guidance document, *WHO Guidelines on the Use of Antivirals and Vaccines During an Influenza Pandemic,* issued in 2004.

The report also raises other questions about the WHO's transparency and its management of potential conflicts of interest. In particular, it is critical of the WHO's refusal to reveal the names of the members of its Emergency Committee, which was set up to help guide the WHO response to the H1N1 pandemic, including when to change pandemic alert phases. The secrecy fuels conspiracy theories about issues such as the triggering of vaccine contracts, the article says.

In related developments, a committee of the Parliamentary Assembly of the Council of Europe (PACE) today approved a report that denounced the response of the WHO and European national health agencies to the pandemic as an "unjustified scare" that led to a waste of public resources, according to a Council of Europe press release. PACE's social, health, and family affairs committee approved the report in Paris today, setting the stage for a debate on Jun 24 during PACE's summer session.

The WHO in recent months has repeatedly rejected charges of undue pharmaceutical company influence on its pandemic preparations and response and has said it has appropriate procedures for managing potential conflicts of interest. The agency recently commissioned a group of independent experts to review the WHO response to the pandemic.

WHO advisors named

The *BMJ* article was written by the journal's features editor, Deborah Cohen, and Philip Carter, a journalist with the London-based Bureau of Investigative Journalism.

The article lists the three experts who helped develop the WHO guidance as Fred Hayden, of the University of Virginia and the Wellcome Trust; Arnold Monto of the University of Michigan, and Karl Nicholson of the University of Leicester, England.

Hayden authored the part of the 2004 guidance document dealing with the use of antivirals in a pandemic, the article says. He told the *BMJ* that he was being paid by Roche, maker of oseltamivir (Tamiflu), for lectures and consulting when the guidance was produced. The guidance advised governments to consider making plans to ensure they would have a supply of antivirals in the event of a pandemic.

The article says Monto wrote an annex to the WHO guidance that covered vaccine usage in a pandemic. At the time, he was declaring receiving honorariums, consulting fees, and/or research support form three companies, Roche, GlaxoSmithKline (GSK), and ViroPharma, according to the report.

Nicholson wrote another annex, "Pandemic Influenza," to the WHO guidance, the article says. According to declarations he made in *BMJ* and *The Lancet* in 2003, he had received travel funding and honoraria from Roche and GSK for consulting and for speaking at medical conferences.

All three experts told the *BMJ* that the WHO required experts attending agency meetings to complete declarations of interest. But the article adds, "WHO itself did not publicly disclose any of these conflicts of interest when it published the 2004 guidance. It is not known whether information about these conflicts of interest was relayed privately to governments around the world when they were considering the advice contained in the guidelines."

The *BMJ* writers say they asked the WHO for the conflict-of-interest declarations for the meeting that launched the development of the 2004 guidance document. The request was turned down by WHO Director-General Margaret Chan.

Since 2004, according to the *BMJ*, the WHO has produced additional pandemic guidance prepared by experts who had received payments from manufacturers of antivirals and vaccines. These activities included a global preparedness plan in 2005 and an interim Pandemic Influenza Task Force in 2006.

The article also contends that the WHO is inconsistent in its approach to transparency and its management of possible conflicts of interest. While it has kept secret the names of its Emergency Committee members, the names of its Strategic Advisory Group of Experts (SAGE) on Immunization are public knowledge, and the agency publishes summaries of their declarations of interest.

Following a Jun 1 meeting of the Emergency Committee, the WHO yesterday announced it would maintain the current phase 6 pandemic alert for the time being. In the announcement, Chan said the agency guards the names of the committee members "to protect the integrity and independence of the members while doing this crucial work," but promised to reveal them eventually.

The agency told the *BMJ* it protects the names of the Emergency Committee members to shield them from being influenced or targeted by industry.

The *BMJ* article also raises questions about the quality and disclosure of data that led to the licensing of oseltamivir and zanamavir (Relenza) in Europe and the United States, a topic that the journal covered in a review in December. At that time the journal said it couldn't get access to manufacturer data on the two drugs. Since then, staff members of the US Food and Drug Administration and the European Medicines Agency have said the two agencies struggled with the "paucity" of data on zanamivir and oseltamivir, respectively, during the licensing process, the article says.

Call for transparency supported

Steven Miles, MD, a bioethicist at the University of Minnesota Medical School in Minneapolis, said the *BMJ* article shows that the WHO needs to be more transparent about its advisors' potential conflicts of interest and the data it relies on.

"The bottom line is that the WHO is looked to for health policy by the world community, including many countries which do not have the capacity to evaluate the health policy and technical questions that they turn to the WHO for guidance on," he said.

"For this reason the WHO has to have the strongest possible standard both with regard to managing conflicts of interest and transparency regarding the origins of its recommendations," he added. "That includes disclosure not only of conflicts of interest bearing on its experts, but also transparency regarding the data they're relying on.

"In this circumstance it appears that neither was present – that there was no disclosure of industry ties of experts, but also that at least some of the data they were relying on was from industry-funded studies which were under proprietary control."

Miles said the fact that the three experts' connections with industry were known because of their declarations in other publications doesn't excuse the WHO from listing those ties in its guidance document.

'It's not enough if you disclose in one location if you don't disclose in all the locations where you publish," he said. Also, many of the journals in which the experts publish are not open-source journals, so many of the users of WHO guidelines, such as health officials in countries like Thailand or Nepal, would not have access to the publications in which disclosures were made, he added.

In defense of the WHO

The WHO was defended today by Michael T. Osterholm, PhD, MPH, director of the University of Minnesota Center for Infectious Disease Research and Policy, which publishes CIDRAP News.

Osterholm said the WHO needs to rely on leading experts on issues such as antivirals, and such experts will often have some ties to industry. He also said the *BMJ* writers presented no evidence that the industry connections of its advisors led to any inappropriate actions or recommendations by the WHO.

"Over the years there's been a small group of researchers who have concentrated in antiviral treatment and prevention for flu. Why should it be surprising that they may have worked with drug companies on these drugs?" he said. "To exclude them would be to exclude the universe of expertise."

"Today it's very easy to do science witch hunts or character assassination by inference. There's no evidence whatever that any of these individuals acted improperly, nor did WHO," Osterholm added.

If the WHO wanted authoritative information on the use of antivirals, he said, "I can't think of anybody in the world who would know more about it" than Hayden. "Is there any evidence that Fred or anyone like him recommended drugs that benefited him financially?"

Osterholm said he is very supportive of transparency and disclosure, while asserting that the WHO has systems in place to prevent conflicts of interest from distorting recommendations or votes. Ultimately, he said, the relevant decisions were made by the WHO itself, not by its expert advisors.

Council of Europe report

The PACE committee report denouncing the pandemic response by the WHO and European governments was produced by committee member Paul Flynn, a Labour member of the British parliament.

The Council of Europe, a group separate from the European Union, works on issues such as civil rights, economics, and democracy. The group was established after World War II and is made up of elected officials from 47 nations.

The committee's report charges that there were "grave shortcomings" in the transparency of decision making during the pandemic, which they say raises questions about pharmaceutical industry influence. They questioned why the WHO emergency group and European advisory groups didn't publicize the names and conflict-of-interest declarations of their members.

Fiona Godlee, editor-in-chief of the *BMJ*, appeared before the committee today to detail the journal's report that scientists with drug industry ties helped WHO develop guidelines on flu vaccine stockpiling.

The PACE committee's report recommends several measures designed to improve transparency and safeguard against what it says is undue influence. The group also calls for a public fund to support independent research and expert advice, possibly funded by the pharmaceutical industry, and closer collaboration with the media to avoid sensationalistic coverage of public health events.

Before and during a PACE committee hearing in January, the WHO defended itself from the accusations. Keiji Fukuda, MD, special advisor on pandemic influenza to the WHO director-general, said the new virus that quickly swept the globe required an unprecedented global cooperation from wide-ranging groups, including pharmaceutical companies.

He said the International Health Regulations (IHR) provide an orderly framework for assessing and declaring a pandemic.

A pharmaceutical company representative also rejected the committee's charges at its hearing in January. Dr Luc Hessel, chairman of the European Vaccine Manufacturers Public Health Policy and Advocacy working group, said vaccine companies delivered a safe, effective vaccine in a timely manner, as countries asked them to do, based on the best information they had at the time.

He said many governments had preexisting contracts for pandemic vaccine to avoid difficult negotiations and ease the response during a public health emergency. Hessel countered that vaccine companies have shouldered financial risks in advance of the pandemic by expanding production capacity.

Several top health officials have defended government and WHO actions in the wake of the PACE committee's criticisms. For example, British Heath Secretary Andy Burnham told the House of Commons in January that he would not apologize for preparing to protect the public during a pandemic, and Australia's chief medical officer, Jim Bishop, in a media report called some of the groups claims "historically and medically inaccurate" and said the WHO made its pandemic decisions based on cases and deaths in Mexico and the United States, not on pharmaceutical industry influence.

At the recent World Health Assembly, which wrapped up its work on May 21, representatives from several nations, including France, India, and the United States, also defended the WHO's pandemic actions, according to media reports. French health minister Roselyne Bachelot called criticism of the WHO's response unfair.

"The vaccine, which was the answer to a real danger, turned into a source of risk in the collective mind," Bachelot said, according to Agence France-Presse. "The effects of this smear campaign are potentially devastating."

Placebo medicine for a pandemic that never was

Montreal Gazette, 4 June 2010
https://montrealgazette.com/health/placebo-medicine-for-a-pandemic-that-never-was

June 8 update: For Dr Margaret Chan letter sent to the editors of BMJ in reference to their article on conflicts of interest at the WHO, please scroll down.

Remember the confusion over who should be first in line for the swine flu jab during in the slow roll out of vaccines? What about the ugly queue jumping ahead of pregnant women, young children and people with underlying medical problems?

Well, all that bad behaviour was for nought because, as it turned out later, there was enough vaccine to go around. Half the vaccine doses went to store rooms, wasted because government health agencies weren't ready to deliver them.

Second, the whole exercise might have been a giant waste of public health funds, one that was based on unjustified scares. Simply put, this was a pandemic that never was. And all those vaccines? The jab so many clamoured for so noisily was just a fancy placebo handed out on a massive scale.

That's what a report critical of the World Health Organization's handling of the H1N1 pandemic suggests. The report prepared by the Social, Health and Family Affairs Committee of the Parliamentary Assembly of the Council of Europe (PACE) and made public June 3 in Paris, had serious issues with transparency at the WHO and influence of the pharmaceutical industry on decisions taken.

Why did the WHO change its definition of a phase 6 pandemic? Instead of severity of illness and the number of deaths, it argued for distribution. And why didn't the WHO "amend its fear mongering" when early on it became evident in Mexico that HIN1 was a mild flu and not a killer, and the pattern world wide was similar? demanded British MP Paul Flynn, who prepared the report.

Earlier this year, in response to other criticisms of the WHO's H1N1 agenda, its director Dr. Margaret Chan dismissed allegations of ties to Big Pharma as "conspiracies" and the notion of a fake pandemic

Flynn's report coincided with a BMJ investigation, WHO and the pandemic flu "conspiracies" published earlier this week with an editorial on conflicts of interest and pandemic flu.

June 8 update: Here is the response of the World Health Organization (WHO) director-general Dr Margaret Chan in a letter sent to the editors of BMJ in reference to their article on conflicts of interest at the WHO.

To the Editors,

In the editorial accompanying the feature on conflicts of interest at WHO ,, the author notes that it is "almost certainly true" that the mildness of the H1N1 pandemic, compared with the severity long expected from a virus like H5N1, has contributed to the current critical scrutiny of WHO's decisions. As the editorial further states, this reality does not make it wrong to ask hard questions.

We fully agree. Good investigative journalism brings problems, and their potential consequences, into sharp focus and identifies the need for remedial action. Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and profit-driven industry. WHO needs to establish, and enforce, stricter rules of engagement with industry, and we are doing so. However, let me be perfectly clear on one point. At no time, not for one second, did commercial interests enter my decision-making.

I take issue with the assumption that WHO simply dismisses these hard questions as unfounded. In January 2010, I suggested that a Review Committee, an independent mechanism under the International Health Regulations, be used to evaluate WHO's performance during the influenza pandemic. This recommendation was accepted by members of the WHO Executive Board, and the Committee's work began on 12 April 2010. The Committee agreed to address criticism currently being levelled at WHO as part of its evaluation. I have publicly expressed my desire to see a critical, independent, and transparent assessment of WHO's performance.

The implication that WHO provoked unjustified fear also needs to be addressed. The record is otherwise, and not a matter of interpretation. On 11 June 2009, when I announced the start of the pandemic, I drew attention to the fact that the worldwide number of deaths was small, and clearly stated that we did not expect to see a sudden and dramatic jump in the number of severe or fatal infections. In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment.

Concerning the members of the Emergency Committee that advised WHO on the pandemic, including phase changes, the names will be released when the Committee finishes its work, as has always been intended. Our decision not to make these names public was motivated by a desire to protect the experts from commercial or other influences. The members themselves welcomed this decision as a protective measure, and not as an attempt to veil their deliberations and decisions in secrecy. Records of all Emergency Committee meetings were kept, and these and all other documents pertaining to WHO's pandemic decisions and actions have been placed at the disposal of the Review Committee.

Without question, the BMJ feature and editorial will leave many readers with the impression that WHO's decision to declare a pandemic was at least partially influenced by a desire to boost the profits of the pharmaceutical industry. The bottom line, however, is that decisions to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria. It is hard to bend these criteria, no matter what the motive.

Accusations that WHO changed its definition of a pandemic in order to accommodate a less severe event (and thus benefit industry) are not supported by the facts. The current pandemic preparedness plan, which includes phase definitions, was finalized in February 2009 following two years of consultations. A new strain of H1N1 was neither on the horizon nor mentioned in the document.

A full record and timeline of events leading to the publication of the 2009 plan have been placed at the disposal of the Review Committee. Should this Committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on.

World Health Organization Scientists Linked to Swine Flu Vaccine Makers
Investigation raises questions about WHO's handling of pandemic

ABC News, 5 June 2009, 05:09 am
https://abcnews.go.com/Health/SwineFlu/swine-flu-pandemic-world-health-organization-scientists-linked/story?id=10829940

June 5, 2010 – Scientists who advised the World Health Organization on its influenza policies and recommendations – including the decision to proclaim the so-called swine flu a "pandemic" had close ties to companies that manufacture vaccines and antiviral medicines like Tamiflu, a fact that WHO did not publicly disclose.

The links between the advisors and the companies that make money from vaccines and flu treatments were detailed in a report published online by the British medical journal BMJ, which investigated the advisors' role in WHO's policy.

The report by Deborah Cohen, features editor of BMJ, and Philip Carter, a journalist with the Bureau of Investigative Journalism in London, acknowledged that flu experts do "need to work with industry to develop the best possible drugs for illnesses," but said that allowing industry experts to have a role in the formulation of public health policy was a slippery slope.

And worse, Cohen and Carter said, was the failure of WHO officials to disclose the conflicts of interest or even identify the members of its advisory committee.

In a statement, WHO's secretary-general Margaret Chan, MD, MPH, said the purpose of keeping the committee members anonymous "is to protect the integrity and independence of the members while doing this critical work – but also to ensure transparency by publicly providing the names of the members as well as information about any interest declared by them at the appropriate time."

And in the U.S. a spokesperson for the Department of Health and Human Services defended WHO's handling of the pandemic.

"The WHO handled the outbreak in a very measured and appropriate manner," he said. "Their decisions were driven by the existing and evolving conditions at the time and what the best scientific information was telling us. It's very easy to look back through a 20-20 lens and essentially be an armchair quarterback."

Addressing the possibility of industry-influence on WHO's decisions, the spokesman said, "The WHO based its decisions on strong public health considerations and I don't think there was any indication from our perspective that their decisions were influenced by industry in any way."

The H1N1 pandemic, which will mark its one-year anniversary on June 11, "could, of course, have been far worse," Cohen and Carter wrote. "Planning for the worst while hoping for the best remains a sensible approach. But our investigation has revealed damaging issues. If these are not addressed, H1N1 may yet claim its biggest victim – the credibility of the WHO and the trust in the global public health system."

And the medical journal wasn't the only entity going on record with a critical assessment of WHO. A report from the Council of Europe Parliamentary Assembly published on the same day the BMJ report was released called into question WHO's handling of the H1N1 pandemic.

An official Council of Europe inquiry led by Paul Flynn, a British member of parliament, concluded that the "Parliamentary Assembly is alarmed about the way in which the H1N1 influenza pandemic has been handled, not only by the World Health Organization (WHO), but also by the competent health authorities at the level of the European Union and at national level."

Flu experts rebut conflict claims

Nature, 8/10 June 2010, 465, 672–673
https://doi.org/10.1038/465672a

"Drug firms 'encouraged world health body to exaggerate swine flu threat'," screamed Britain's Daily Mail newspaper on 4 June. "2 European reports criticize WHO's H1N1 pandemic guidelines as tainted," headlined The Washington Post the next day. To judge from media coverage last week, a major scandal had been exposed in the handling of the H1N1 flu pandemic by the World Health Organization (WHO). But nothing could be further from the truth.

The news articles reported on two investigations: one by journalists at the BMJ and the Bureau of Investigative Journalism, a non-profit body in London launched in April; the other by the health committee of the Parliamentary Assembly of the Council of Europe (PACE) – a human-rights body based in Strasbourg, France, independent of the European Union.

Both reports allege that the WHO might have been unduly influenced by the pharmaceutical industry in declaring H1N1 flu a pandemic, and in backing widespread vaccination and stockpiling of antiviral drugs, a claim often made by conspiracy theorists. They also complain that a 2004 WHO pandemic-preparedness document did not reveal that some of its authors had been paid for work by pharmaceutical companies – although the scientists had declared their competing interests elsewhere.

Suspicious minds

Paul Flynn, a UK Labour Member of Parliament and rapporteur of the PACE report (see go.nature.com/G9CvVL), and Fiona Godlee, editor-in-chief of the BMJ, presented their reports at a press conference together in Paris on 4 June, with Flynn asserting that "this was a pandemic that never really was". Afterwards, he wrote on his blog: "One of the joys today was giving evidence with the editor of the splendid British Medical Journal. We have never met before but we cooed in harmony and just avoided saying it was the Pharmas that did it."

Both reports say that it is suspicious, for example, that the WHO has kept secret the names of its Emergency Committee, an expert group that advises the WHO on the status of international public-health emergencies, including the declaration of a flu pandemic. Gregory Hartl, a spokesman for the WHO, says that the secrecy of the Emergency Committee's membership is maintained to buffer its deliberations from outside pressure. The WHO says that it will make public the names, and any competing interests, once the pandemic is declared over.

"A key question will be whether the pharmaceutical companies, which had invested around $4 bn (£2.8bn, €3.3bn) in developing the swine flu vaccine, had supporters inside the emergency committee, who then put pressure on WHO to declare a pandemic," says the article in the BMJ (D. Cohen and P. Carter Br. Med. J. 340, c2912; 2010). "It was the declaring of the pandemic that triggered the contracts."

This is false. Many countries – including the United Kingdom, France, Belgium, Finland, Canada, the Netherlands and Switzerland – had already placed large orders for H1N1 vaccine weeks before the WHO declared H1N1 a pandemic on 11 June 2009. The United States, for example, ordered US$649 million of pandemic H1N1 influenza vaccine antigen and $283 million of adjuvant on 22 May 2009. So the Emergency Committee could not have influenced these in any way.

"You are absolutely right," conceded the authors of the articles in the BMJ when challenged with this timeline.

Both reports also seize on the WHO's April 2009 revision of its criteria on what constitutes a pandemic, which removed the need for an assessment of the 'severity' of the disease, based on estimates of future mortality. Flynn speculated in the Daily Mail that this was suspicious: "In this case, it might not just be a conspiracy theory, it might be a very profitable conspiracy." Neither report provides any evidence to substantiate its implication that the WHO rushed to declare a pandemic to boost pharmaceutical company sales. Moreover, the WHO says that the revisions were finalized in February 2009, before pandemic H1N1 was on the horizon.

Scientists interviewed by Nature early on in the pandemic noted that severity is impossible to pin down until many months after it starts. Also, pandemic viruses can mutate or reassort to become more severe, so initial estimates are in any case of limited use.

Clear firewall

The BMJ also notes that three scientists who were involved in the preparation of a 2004 WHO document, WHO Guidelines on the Use of Vaccines and Antivirals during Influenza Pandemics, had received payments from pharmaceutical companies, including research funding, or consultancy or speaker fees. The scientists told the BMJ that they had declared these competing interests to the WHO, although the WHO had not included these in its report.

Michael Osterholm, director of the University of Minnesota's Center for Infectious Disease Research and Policy in Minneapolis, points out that the 2004 document was based on input from an international panel of 22 scientists and public-health officials, in response to the threat of the deadly H5N1 avian flu virus. "To suggest that the three scientists were able to direct and control the final recommendations is naive, and stated without a single shred of evidence," he says.

The BMJ also claims that industry funding of the European Scientific Working Group on Influenza (ESWI), a group of flu scientists that provided advice to the WHO, presented a "potential conflict of interest". It notes that several ESWI scientists also receive industry funding directly.

One of those scientists is Albert Osterhaus, a virologist at Erasmus Medical Centre in Rotterdam in the Netherlands, who chairs the ESWI. He says that the body has a "clear firewall" with its funders, and that it informs all partners about any of its competing interests – its sources of funding are also listed on its website. Private–public partnerships are essential in tackling pandemics, and excluding flu researchers with industry links would deprive advisory panels of world-class expertise, he says. "The critical thing is transparency," says Osterhaus. "I have always declared my own competing interests."

The BMJ acknowledges that the researchers had declared their interests elsewhere. But it takes issue with the WHO's not having included them in its pandemic-planning documents.

David Ozonoff, an epidemiologist at the Boston University School of Public Health in Massachusetts, says that the reports "smear" the scientists involved in pandemic planning by "insinuating" that they would have offered different advice had they not had a relationship with drug companies. "This is a pretty serious charge," he says.

"We think this is the researcher's reading into it, not necessarily ours," the BMJ authors respond.

Marc Lipsitch, an epidemiologist at Harvard School of Public Health in Boston, Massachusetts, says that the WHO's advice on the pandemic has been sound, and has reflected the state of scientific opinion. Comparing the situation with the ongoing Deepwater Horizon oil spill, Lipsitch says that "it is ironic, as we watch for the second time in five years the catastrophic results of 'best-case scenario planning' in the Gulf of Mexico, to have the WHO coming under criticism for planning for, and raising awareness of, the possibility of a severe pandemic. That is what public-health agencies should do, and what most did in this instance, and they should be commended for it."

World Health Organization

Margaret Chan

WHO Director-General's letter to BMJ editors

Geneva, WHO, 8 June 2010

https://web.archive.org/web/20101011195712/http://www.who.int/mediacentre/news/statements/2010/letter_bmj_20100608/en/index.html

Below you will find a copy of the letter Dr Margaret Chan, Director-General of the World Health Organization (WHO) sent to the editors of the BMJ, formerly *British Medical Journal*, in reference to their article on conflicts of interest at the WHO.

To the Editors,

In the editorial accompanying the feature on conflicts of interest at WHO, the author notes that it is "almost certainly true" that the mildness of the H1N1 pandemic, compared with the severity long expected from a virus like H5N1, has contributed to the current critical scrutiny of WHO's decisions. As the editorial further states, this reality does not make it wrong to ask hard questions.

We fully agree. Good investigative journalism brings problems, and their potential consequences, into sharp focus and identifies the need for remedial action. Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and profit-driven industry. WHO needs to establish, and enforce, stricter rules of engagement with industry, and we are doing so. However, let me be perfectly clear on one point. At no time, not for one second, did commercial interests enter my decision-making.

I take issue with the assumption that WHO simply dismisses these hard questions as unfounded. In January 2010, I suggested that a review committee, an independent mechanism under the International Health Regulations, be used to evaluate WHO's performance during the influenza pandemic. This recommendation was accepted by members of the WHO Executive Board, and the Review Committee's work began on 12 April 2010. The Committee agreed to address criticism currently being levelled at WHO as part of its evaluation. I have publicly expressed my desire to see a critical, independent, and transparent assessment of WHO's performance.

The implication that WHO provoked unjustified fear also needs to be addressed. The record is otherwise, and not a matter of interpretation. On 11 June 2009, when I announced the start of the pandemic, I drew attention to the fact that the worldwide number of deaths was small, and clearly stated that we did not expect to see a sudden and dramatic jump in the number of severe or fatal infections. In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment.

Concerning the members of the Emergency Committee that advised WHO on the pandemic, including phase changes, the names will be released when the Committee finishes its work, as has always been intended. Our decision not to make these names public was motivated by a desire to protect the experts from commercial or other influences. The members themselves welcomed this decision as a protective measure, and not as an attempt to veil their deliberations and decisions in secrecy. Records of all Emergency Committee meetings were kept, and these and all other documents pertaining to WHO's pandemic decisions and actions have been placed at the disposal of the Review Committee.

Without question, the BMJ feature and editorial will leave many readers with the impression that WHO's decision to declare a pandemic was at least partially influenced by a desire to boost the profits of the pharmaceutical industry. The bottom line, however, is that decisions to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria. It is hard to bend these criteria, no matter what the motive.

Accusations that WHO changed its definition of a pandemic in order to accommodate a less severe event (and thus benefit industry) are not supported by the facts. The current pandemic preparedness plan, which includes phase definitions, was finalized in February 2009 following two years of consultations. A new strain of H1N1 was neither on the horizon nor mentioned in the document.

A full record and timeline of events leading to the publication of the 2009 plan have been placed at the disposal of the Review Committee. Should this Committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on.

WHO Chief defends management of swine flu pandemic

AFP, The Flu Case, 8 June 2010 13:13
https://web.archive.org/web/20100814170432/http://www.theflucase.com/index.php?option=com_content&view=article&id=3675%3Awho-chief-defends-management-of-swine-flu-pandemic&catid=1%3Alatest-news&Itemid=64&lang=en

Geneva – The head of the World Health Organization on Tuesday defended the agency's handling of the swine flu pandemic, rejecting a top medical journal claims that it was marred by commercial interests.

"At no time, not for one second, did commercial interests enter my decision-making," said Margaret Chan, WHO director-general, in a letter sent to the British Medical Journal, following the publication's article.

The BMJ had said in a report last week that the WHO's actions on the pandemic was deeply marred by secrecy and conflicts of interest with drug companies for some experts advising the agency.

The report also revealed that at least one member of the secret, 16-member "emergency committee" formed last year to advise the WHO on whether and when to declare a pandemic received payment during 2009 from drugmaker GlaxoSmithKline.

Chan said that the names of the emergency committee had been kept secret in order to "protect the experts from commercial or other influences" and not to withhold information about their deliberations.

She also challenged the journal's claim that the WHO provoked unjustified fear about the pandemic.

"The record is otherwise, and not a matter of interpretation," said Chan, pointing to her announcement when declaring the pandemic that the worldwide fatality rate was low.

"I take issue with the assumption that WHO simply dismisses these hard questions as unfounded," she said, pointing out that a committee had been set up to examine the agency's handling of the pandemic.

Harvey Fineberg, chairman of the WHO's committee of external experts reviewing the handling of the pandemic, on Monday welcomed the BMJ's report and said it would be "fully considered by our Review Committee."

The committee is due to release its findings by the beginning of 2011.

Drug companies no influence in swine flu?

NBC News // The Associated Press, 8 June 2010, 10:38 PM +08
https://www.nbcnews.com/id/wbna37570679

The head of the World Health Organization on Tuesday strongly rejected suggestions that her decisions about swine flu were influenced by advisers' links to pharmaceutical companies.

The head of the World Health Organization on Tuesday strongly rejected suggestions that her decisions about swine flu were influenced by advisers' links to pharmaceutical companies.

"At no time, not for one second, did commercial interests enter my decision-making," WHO Director-General Margaret Chan said.

She also dismissed claims the global health body had stirred unnecessary public fear over the pandemic.

Her statement came in response to an article in the British Medical Journal that questioned the way WHO managed conflicts of interest among its scientific advisers and the transparency of its advice to governments.

WHO's handling of the outbreak is being reviewed by a 29-member expert panel that will report its findings next year. Critics say many of the panelists are also trusted WHO advisers and government employees who could end up whitewashing any failures.

The names of the scientists who advised Chan on the threat posed by swine flu have never been published and WHO said they will only be released once the pandemic is declared over.

"Our decision not to make these names public was motivated by a desire to protect the experts from commercial or other influences," Chan said, adding that it was not an attempt to keep the panelists' deliberations secret.

WHO said it will make records of the advisers' meetings available to the review panel but hasn't indicated any willingness to release them publicly.

Chan insisted she was open to the panel's criticism. "Should this committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on."

Harvey Fineberg, the president of the Institute of Medicine in Washington, said the review panel which he heads will hear from critics of WHO when it next meets from June 30 to July 2.

A report published by the Council of Europe last week said the public health guidelines by WHO, European Union agencies and national governments led to a "waste of large sums of public money and unjustified scares and fears about the health risks faced by the European public." The report by the EU's human rights watchdog said decisions about the outbreak were poorly explained and not sufficiently transparen

WHO Says Failure to Disclose Conflict of Interests of Pandemic Advisors was an "Oversight"

MedScape, 8 June 2010
https://web.archive.org/web/20101023150028/https://www.medscape.com/viewarticle/723191

The World Health Organization (WHO) committed an oversight when it failed to disclose conflicts of interest for scientists who have advised it on pandemic influenza policies, a spokesperson for the agency said today.

WHO collected so-called declarations of interest from the scientists in question, but never published them, agency spokesperson Gregory Hartl told *Medscape Medical News*.

"It was an oversight," said Hartl. "If we were using today's practices, we would have published the summary for the relevant interests. The way we handle [declarations of interest] is a work in progress."

Hartl's comments were in response to an article published June 4 in the *British Medical Journal* (BMJ) documenting the agency's failure to disclose conflicts of interest for its scientific advisors. The article's authors, *BMJ* features editor Deborah Cohen and journalist Philip Carter from the nonprofit, London-based Bureau of Investigative Journalism, write that this lack of transparency has fed a widespread conspiracy theory — namely, that WHO declared a "fake" pandemic to boost sales for pharmaceutical companies that manufacture antiviral drugs and the H1N1 vaccine.

A group called the Parliamentary Assembly of the Council of Europe (PACE) leveled the same criticisms at WHO in a report also issued June 4. PACE stated that WHO's handling of the H1N1 influenza pandemic has resulted in unjustified fears, "the waste of large sums of public money," and the possibility that the public will not heed agency recommendations the next time a pandemic strikes. The Council of Europe is a 47-member group distinct from the European Union.

In a letter to the *BMJ* that WHO released today, WHO Director-General Margaret Chan, MD, defended the integrity of her agency.

"At no time, not for 1 second, did commercial interests enter my decision making," Dr. Chan stated. She also said potential conflicts of interest are "inherent" in the relationship with public health agencies and for-profit businesses, and that WHO needs to establish and enforce "stricter rules of engagement with industry."

[Editor's Note: On June 10, WHO released this response to its critics.]

Industry observers have noted that neither the *BMJ* article nor the PACE report offer any evidence that anyone at WHO issued a recommendation or made a decision with an individual's or company's financial gain in mind.

WHO has convened a special review committee to investigate the possible influence that the private sector may have exerted on the agency and its committees. Dr. Chan asked the review committee, chaired by Harvey Fineberg, MD, PhD, president of the Institute of Medicine, to glean lessons from how WHO and the international community responded to the pandemic.

In a written statement released on June 4, Dr. Fineberg said his committee "welcomes the opportunity to learn from reports published today by the *British Medical Journal* and released by...the Parliamentary Assembly of the Council of Europe." Dr. Fineberg's committee is scheduled to deliver a final report to WHO in May 2011.

Critics Say Emergency Committee Should Not Operate in Anonymity

BMJ authors Deborah Cohen and Philip Carter assert that WHO drafted a series of plans to combat future influenza pandemics with the help of scientists who had financial ties to Roche and GlaxoSmith-Kline – manufacturers of the antiviral drugs oseltamivir (*Tamiflu*) and zanamivir (*Relenza*). However, WHO did not disclose these links, according to Cohen and Carter.

The plans, which date back to 1999, included guidelines published in 2004 that recommended stockpiling antivirals in preparation for a pandemic. There were no conflict of interest statements for 3 contributing scientists who had received honorariums, consultancy fees, research support, and travel sponsorship from the 2 antiviral manufacturers, write Cohen and Carter.

Furthermore, the *BMJ* authors criticize WHO for not identifying the members of its Emergency Committee, which has advised the WHO director-general on the influenza pandemic. When Dr. Chan declared on June 11, 2009, that H1N1 disease activity had reached the full-blown pandemic level on the agency's pandemic scale, she based her decision on the committee's recommendation.

WHO has defended giving anonymity to the members of the committee for the sake of shielding them from outside influences, but Cohen and Carter point out that the agency does not hide the identity of members of other key committees, such as the Strategic Advisory Group of Experts on Immunization.

In her letter to the *BMJ*, Dr. Chan said WHO would release the names of the Emergency Committee members once their work is over, as the agency had intended all along. Furthermore, the special review committee investigating WHO's handling of the pandemic will have access to records of all Emergency Committee meetings.

WHO Did Not Exaggerate Pandemic's Severity, Secretary-General Says

The lack of transparency about the Emergency Committee ranks high on the list of complaints in the report released by PACE. It stated that committee members with conflicts of interest could have done vaccine manufacturers a favor by declaring that a pandemic was underway. This declaration triggered "sleeper contracts" for European nations to purchase prearranged quantities of vaccine, according to the report.

WHO made it easier to justify the declaration by redefining a pandemic, PACE stated. Before May 4, 2009, according to PACE, WHO's Web site said that "an influenza pandemic occurs when a new influenza virus appears against which the human population has no immunity, resulting in several, simultaneous epidemics worldwide with enormous numbers of deaths and illness." However, WHO removed the qualifying reference to "enormous number of deaths and illness" after it revised its pandemic preparedness plan. Now the agency Web site says that influenza pandemics "can be either mild or severe in the illness and death they cause."

Dr. Chan denied in her letter to the *BMJ* that WHO revised its definition of a pandemic "to accommodate a less severe event and thus benefit industry." The agency, she said, completed its current pandemic preparedness plan along with its definition of a pandemic in February 2009, before "a new strain of H1N1 was on the horizon."

In addition, WHO spokesperson Gregory Hartl told *Medscape Medical News* that the previous agency description of a pandemic with the reference to "enormous numbers of deaths and illness" was just that — a description, not an official definition.

"It's not a definition, but we recognize that it could be taken as such," said Hartl. "It was the fault of ours, confusing descriptions and definitions."

Although WHO eliminated disease severity as a defining feature of an influenza pandemic, the agency nevertheless stands accused of exaggerating the virulence of the H1N1 pandemic, which has killed fewer people than seasonal flu in the United States does on an annual basis. Dr. Chan said in her letter to the *BMJ* that when she declared a pandemic in June 2009, she noted that the number of deaths at that point was small and that WHO did not expect to see a sudden and dramatic jump in the number of severe or fatal infections.

"In every assessment of the pandemic," she stated. "WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid recovery, even without medical treatment."

Pandemic Was Not a Fake, Says Department of Health and Human Services Spokesperson

WHO has not lacked for defenders as it catches flak from the European sector.

"WHO handled the H1N1 outbreak in a measured and appropriate way, and there was no indication that any of their decisions were influenced by industry," Bill Hall, a spokesperson for the US Department of Health and Human Services, told *Medscape Medical News*. "Their decisions were driven by the existing and evolving conditions using the best scientific information available at the time."

Hall also said it was "wrong and flat-out irresponsible" to call the outbreak a fake pandemic.

Others such as Michael Osterholm, PhD, MPH, director of the University of Minnesota Center for Infectious Disease Research and Policy (CIDRAP), contend that public health agencies such as WHO cannot easily avoid the problem of conflict of interest because scientific experts often have ties to industry.

"Over the years there's been a small group of researchers who have concentrated in antiviral treatment and prevention for flu," the publication *CIDRAP News* recently quoted Dr. Osterholm as saying. "Why should it be surprising that they may have worked with drug companies on these drugs? To exclude them would be to exclude the universe of expertise."

Dr. Osterholm noted that he supported transparency and disclosure when conflicts of interest do arise.

World Health Organization fires back at critics of H1N1 response
Director-General Margaret Chan says
drug companies' interests didn't shape decisions 'for one second'

Globe and Mail, 8 June 2010, 7:17 PM EDT
https://web.archive.org/web/20100610061011/http://www.theglobeandmail.com/life/health/world-health-organization-fires-back-at-critics-of-h1n1-response/article1596903/

With the H1N1 flu all but over in many parts of the world and questions about the World Health Organization's handling of the pandemic beginning to mount, the head of the global health body has come out swinging at her critics.

Director-General Margaret Chan rejected claims that the WHO provoked unnecessary fear, and then, directing her comments to an article published in a prominent British medical journal, she dismissed suggestions that her decisions on the pandemic were influenced by ties to the pharmaceutical industry.

"At no time, not for one second, did commercial interests enter my decision-making," Dr. Chan said in a statement Tuesday.

Her comments are in response to last week's report in the BMJ that said three scientists at the WHO received payments from Roche and GlaxoSmithKline, manufacturers of antiviral drugs, and also helped prepare pandemic guidelines in 2004 that included the use of antivirals. The WHO did not publicly disclose their conflicts of interests, the journal stated. Further, the journal asked why the names of those who sit on the emergency committee and advise Dr. Chan are shrouded in secrecy.

In an accompanying editorial, BMJ editor Fiona Godlee said the WHO's credibility had been damaged. "Recovery will be fastest if it publishes its own report without delay or defensive comment; makes public the membership and conflicts of interest of its emergency committee; and develops, commits to, and monitors stricter rules of engagement with industry that keep commercial influence away from its decision making," Dr. Godlee wrote.

The WHO's handling of the outbreak is being reviewed by an independent committee, which will likely report back by next year. In the meantime, Dr. Chan said the BMJ article leaves an unfair impression that the WHO's decision to declare a pandemic was partially motivated by a desire to fatten the pockets of the pharmaceutical industry, which stood to profit from the sale of the vaccine and anti-viral medications.

"The bottom line, however, is that decisions to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria. It is hard to bend these criteria, no matter what the motive," she said.

The review committee, she said, will examine the events leading up to the pandemic and the WHO will be open to its recommendations and criticisms. "Should this committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on," Dr. Chan said.

She added that the names of members on the emergency committee will be made public once their work is completed, and that the reason not to identify them beforehand is to protect them from commercial or other influences.

Influenza activity has remained low in Canada for the past few months, leaving the federal government with millions of doses of unused pandemic vaccine. A report by the Council of Europe last week accused the WHO of exaggerating the threat of H1N1, unnecessarily scaring the public and causing countries to waste millions of dollars fighting it.

Dr. Chan said that when she announced the start of the pandemic on June 11 of last year, she also made mention of the fact that the number of deaths was small. “In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment,” Dr. Chan said.

CIDRAP

WHO director replies to *BMJ* critique of pandemic actions

CIDRAP, 8 June 2009
https://web.archive.org/web/20100610022027/http://www.cidrap.umn.edu/cidrap/content/influenza/swineflu/news/jun0810chan.html

Jun 8, 2010 (CIDRAP News) – The head of the World Health Organization (WHO), responding today to recent criticism of WHO policies regarding conflicts of interest and transparency, said the agency needs to tighten its rules for relations with industry but insisted that commercial interests never influenced her decisions regarding the H1N1 influenza pandemic.

WHO Director-General Margaret Chan released a letter she wrote to the *British Medical Journal* (*BMJ*), which published a lengthy investigative report and accompanying editorial last week that were critical of the WHO. The report said that when the WHO in 2004 published guidance on use of vaccines and antivirals in a flu pandemic, it did not disclose the industry ties of three key scientists who helped develop the guidance (though the scientists declared those ties in other publications). The report also criticized the WHO for withholding the names of members of the emergency committee that has advised the agency on pandemic alert phase decisions.

In her letter of response, Chan wrote, "Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and profit-driven industry. WHO needs to establish, and enforce, stricter rules of engagement with industry, and we are doing so. However, let me be perfectly clear on one point. At no time, not for one second, did commercial interests enter my decision-making." The letter does not specify what steps the agency is taking to strengthen conflict-of-interest policies.

Chan also objected to what she called "the assumption that WHO simply dismisses these hard questions as unfounded," pointing to the agency's recent commissioning of a committee of outside experts to review the WHO's pandemic performance. The committee plans to address recent criticisms of the WHO over the pandemic, she noted.

In addition, Chan rejected "the implication that WHO provoked unjustified fear" about the H1N1 virus. She said that when she declared the pandemic under way on Jun 11, 2009, "I drew attention to the fact that we did not expect to see a sudden and dramatic jump in the number of severe or fatal infections. In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment."

Concerning the identities of the Emergency Committee members, Chan essentially reiterated points she has made previously: that the WHO wants to protect the members from commercial or other pressures and that the names will be released when the committee's work is done. Records of the committee meetings and of all other documents related to the WHO's pandemic actions have been provided to the review committee, she added.

She said the *BMJ* pieces give the clear impression that the WHO's declaration of the pandemic was influenced to some degree by a desire to boost the pharmaceutical industry. "The bottom line, however, is that the decisions to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria," she wrote. "It is hard to bend these criteria, no matter what the motive."

Chan also denied the allegation that the WHO "changed its definition of a pandemic in order to accommodate a less severe event (and thus benefit industry)." She said the current WHO pandemic plan, with its phase definitions, was completed in February 2009, about 2 months before the H1N1 virus emerged. The *BMJ* article alleged that the agency changed its definition of a pandemic in May 2009, dropping a portion that said pandemics cause "enormous numbers of deaths and illness."

Chan's letter does not refer specifically to another recent critique of the WHO's pandemic actions, from a committee of the Parliamentary Assembly of the Council of Europe (PACE). That report, released Jun 4, denounced the pandemic response by the WHO and European health authorities as an unwarranted scare that led to a waste of public resources. The report is expected to be debated at a PACE session Jun 24.

In related developments, another allegation made in the BMJ article – that the declaration of a pandemic was what triggered orders for H1N1 vaccine – was addressed today in a news report in *Nature.* The *BMJ* report speculated that pharmaceutical company supporters on the WHO Emergency Committee may have pushed for a pandemic declaration because this would trigger vaccine contracts. But the *Nature* story by Declan Butler points out that many countries, including the United States, Britain, France, and Canada, ordered large amounts of H1N1 vaccine well before the pandemic declaration on Jun 11, 2010. The story says the *BMJ* authors conceded this point when challenged.

GULF NEWS

WHO: Pharma interests didn't influence flu verdict
WHO director-general rejects claims her decisions about swine flu were biased

Gulf News, 8 June 2010, 16:44 AP
https://gulfnews.com/world/europe/who-pharma-interests-didnt-influence-flu-verdict-1. 638441

Geneva: The head of the World Health Organization on Tuesday strongly rejected suggestions that her decisions about swine flu or H1N1 were influenced by advisers' links to pharmaceutical companies.

"At no time, not for one second, did commercial interests enter my decision-making," WHO Director-General Margaret Chan said.

She also dismissed claims the global health body had stirred unnecessary public fear over the pandemic.

Her statement came in response to an article in the British Medical Journal that questioned the way WHO managed conflicts of interest among its scientific advisers and the transparency of its advice to governments.

WHO's handling of the outbreak is being reviewed by a 29-member expert panel that will report its findings next year. Critics say many of the panelists are also trusted WHO advisers and government employees who could end up whitewashing any failures.

The names of the scientists who advised Chan on the threat posed by swine flu have never been published and WHO said they will only be released once the pandemic is declared over.

"Our decision not to make these names public was motivated by a desire to protect the experts from commercial or other influences," Chan said, adding that it was not an attempt to keep the panelists' deliberations secret.

WHO said it will make records of the advisers' meetings available to the review panel but hasn't indicated any willingness to release them publicly.

Chan insisted she was open to the panel's criticism. "Should this committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on."

Harvey Fineberg, the president of the Institute of Medicine in Washington, said the review panel which he heads will hear from critics of WHO when it next meets from June 30 to July 2.

A report published by the Council of Europe last week said the public health guidelines by WHO, European Union agencies and national governments led to a "waste of large sums of public money and unjustified scares and fears about the health risks faced by the European public."

FIERCE Pharma

WHO hits back over H1N1 conflict of interest claims

FIERCE, 9 June 2010, 4:50 pm
https://www.fiercepharma.com/vaccines/who-hits-back-over-h1n1-conflict-of-interest-claims

Earlier this week, the head of the World Health Organization defended her body's response to the swine flu outbreak, rejecting accusations made recently in a BMJ report that commercial interests influenced its decision-making. "At no time, not for one second, did commercial interests enter my decision-making," Director-General Margaret Chan said in a statement Tuesday, as quoted by the *Globe and Mail*.

Her comments came after the publication of a *BMJ* report that pointed out three scientists at the WHO received payments from Roche and GlaxoSmithKline, manufacturers of antiviral drugs, and also helped prepare pandemic guidelines in 2004 that included the use of antivirals. The WHO failed to disclose their conflicts of interests, the journal stated. The journal also asked why the names of those who sit on the emergency committee and advise Dr. Chan aren't public.

BMJ editor Fiona Godlee questioned the WHO's credibility, adding, "Recovery will be fastest if it publishes its own report without delay or defensive comment; makes public the membership and conflicts of interest of its emergency committee; and develops, commits to, and monitors stricter rules of engagement with industry that keep commercial influence away from its decision making."

Firing back, Chan maintained that *BMJ* pieces give the clear impression that the WHO's declaration of the pandemic was influenced to some degree by a desire to boost the pharmaceutical industry – a charge she adamantly denies. "The bottom line, however, is that the decisions to to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria," she writes, as quoted by a Center for Infectious Disease Research & Policy report. "It is hard to bend these criteria, no matter what the motive."

She added that the names of members on the emergency committee will be made public once their work is completed, and that the reason not to identify them beforehand is to protect them from commercial or other influences.

Separately, Gregory Hartl, a spokesman for the agency, told *Medscape Medical News* that the body committed an oversight when it failed to disclose conflicts of interest for scientists who have advised it on pandemic influenza policies. "It was an oversight," said Hartl. "If we were using today's practices, we would have published the summary for the relevant interests. The way we handle [declarations of interest] is a work in progress."

CBC

H1N1 decision free of money interest: WHO

CBC News // The Associated Press, 9 June 2010, 10:50 AM EDT
https://www.cbc.ca/news/science/h1n1-decision-free-of-money-interest-who-1.932200

The head of the World Health Organization says her decisions about swine flu were not influenced by advisers' links to pharmaceutical companies, which were pointed out in a critical journal article this month.

The article last week in the BMJ, formerly known as the British Medical Journal, pointed out that WHO did not disclose potential conflicts of interest among some of the experts involved in writing guidelines for pandemic flu preparations.

Three scientists out of 22 who worked on the guidelines were named as having received some money from pharmaceuticals. The scientists did not work at the drug companies, but were paid for things like speaking at meetings sponsored by them.

The guidelines recommend, among other things, that countries consider buying antivirals and vaccines to combat a pandemic.

The authors of the BMJ article suggest, without providing direct evidence, that these scientists' ties to pharmaceutical companies influenced WHO's recommendation that countries buy drugs and vaccines – adding to those drug companies' profits.

"Our investigation has revealed damaging issues," wrote Deborah Cohen of BMJ and journalist Philip Carter. "These conflicts of interest have never been disclosed by WHO."

WHO's handling of the outbreak is being reviewed by a 29-member expert panel that will report its findings next year. Critics say many of those panelists are also trusted WHO advisers and government employees who could end up whitewashing any failures.

"At no time, not for one second, did commercial interests enter my decision-making," WHO director-general Margaret Chan said Tuesday.

Pandemic definition questions

Chan insisted she was open to the panel's criticism.

"Should this committee decide that the current definition of a pandemic and the phases leading up to its declaration need to be tightened or otherwise revised, this will be another recommendation that we will welcome, and act on."

The U.S. Health and Human Services department defended the UN body.

"WHO handled the outbreak in a very measured and appropriate manner," said Bill Hall, an HHS spokesman.

"Their decisions were driven by the existing and evolving conditions at the time."

He said there was "no indication whatsoever that any of their decisions were influenced by industry."

Other leading officials agreed.

"There was nothing in those guidelines that was not based on the best science available," said Michael Osterholm, a flu expert at the University of Minnesota who has advised the U.S. on pandemic preparations. He said the scientists consulted were the world's top flu experts and to not include them would have been a major flaw.

Osterholm said that because flu viruses are unpredictable, it was impossible for anyone to predict last spring that swine flu would not evolve into a more lethal strain.

He slammed the BMJ article, calling it "irresponsible and reckless," and said its authors had not substantiated their claims WHO behaved inappropriately during the pandemic.

"It's akin to shouting 'fire' in a crowded theatre without regard to the consequences," Osterholm said.

He said while WHO should be subjected to the highest scrutiny, BMJ's accusations had done "untold damage to the public health infrastructure of the world."

Harvey Fineberg, the president of the Institute of Medicine in Washington, said the review panel which he heads will hear from critics of WHO when it next meets from June 30 to July 2.

A report published by the Council of Europe last week said the guidelines from WHO, European Union agencies and national governments led to a "waste of large sums of public money and unjustified scares and fears about the health risks faced by the European public."

The agency is not an EU body.

PharmaTimes online

Kevin Grogan

WHO chief rejects claim of pharma influence over swine flu

PharmaTimes, 9 June 2010
https://pharmatimes.com/news/who_chief_rejects_claim_of_pharma_influence_over_swine_flu_983107/

The World Health Organisation has hit back at allegations made about its handling of the swine flu pandemic and specifically the accusation that guidance given was influenced by pharmaceutical companies.

The World Health Organisation has hit back at allegations made about its handling of the swine flu pandemic and specifically the accusation that guidance given was influenced by pharmaceutical companies.

The swine flu row broke out again at the end of last week after a report from the Council of Europe stated that the handling of the H1N1 flu pandemic by the WHO, as well as European Union agencies and governments led to a “waste of large sums of public money, and unjustified scares and fears’ about the health risks faced. That report was preceded by a joint investigation by the BMJ and The Bureau of Investigative Journalism, which claimed that researchers advising the WHO over preparations for a swine flu pandemic had done paid work for pharmaceutical firms “who stood to gain from the guidance these scientists were preparing”.

The BMJ article also mentioned the “secret ‘emergency committee’ which advised the agency, declaring that the names of the 16 committee members “are known only to people within the WHO, and as such their possible conflicts of interest with drug companies are unknown”.

The latter criticised the WHO’s alleged lack of transparency, prompting Margaret Chan, its director-general, to write to the editors of the BMJ in reference to the article on conflicts of interest. She states in the letter: “let me be perfectly clear on one point. At no time, not for one second, did commercial interests enter my decision-making”.

Dr Chan goes on to say that concerning the members of the emergency committee that advised the WHO on the pandemic, “the names will be released when the committee finishes its work, as has always been intended”. She added that “our decision not to make these names public was motivated by a desire to protect the experts from commercial or other influences. The members themselves welcomed this decision as a protective measure, and not as an attempt to veil their deliberations and decisions in secrecy”.

The WHO chief also stated that the BMJ feature will leave many readers with the impression that the decision to declare a pandemic “was at least partially influenced by a desire to boost the profits of the pharmaceutical industry. The bottom line, however, is that decisions to raise the level of pandemic alert were based on clearly defined virological and epidemiological criteria. It is hard to bend these criteria, no matter what the motive”.

Dr Chan concluded by saying accusations that the WHO changed its definition of a pandemic “in order to accommodate a less severe event (and thus benefit industry) are not supported by the facts”. The current pandemic preparedness plan was finalised in February 2009 following two years of consultations and “a new strain of H1N1 was neither on the horizon nor mentioned in the document”.

World Health Organization

The international response to the influenza pandemic: WHO responds to the critics

Geneva, WHO, 10 June 2010.
https://web.archive.org/web/20100830152255/http://www.who.int/csr/disease/swineflu/notes/briefing_20100610/en/index.html

Pandemic (H1N1) 2009 briefing note 21
Background

10 June 2010 | Geneva - On Friday 4 June 2010, the BMJ, formerly *British Medical Journal*, and the Parliamentary Assembly of the Council of Europe (PACE) simultaneously released reports critical of the World Health Organization's handling of the H1N1 pandemic. WHO takes the issues and concerns that were raised seriously and wishes to set the record straight on several points.

Is this a genuine pandemic?

The outbreaks of infection with the new H1N1 virus, which have been confirmed in virtually every country and territory in the world, differ from seasonal influenza in distinct ways. These differences meet the criteria for an influenza pandemic.

1. The first human infections with the new H1N1 virus were confirmed in April 2009. Analysis of laboratory samples showed that the new virus had never before circulated in humans. This is a virus of animal origin with a unique mix of genes from swine, bird, and human influenza viruses. The genetic composition of this virus is distinctly different from that of the older H1N1 virus that has been causing seasonal epidemics since 1977.

2. As the virus spread, it demonstrated epidemiological patterns not seen during seasonal epidemics of influenza. Widespread, high levels of infection with the new virus occurred during the summer in the northern hemisphere in multiple countries, followed by even higher levels during the fall and winter months. In countries with a temperate climate, seasonal epidemics typically taper off in the spring and end before summer.

3. The pattern of illness and death caused by the H1N1 virus differed in striking ways from that seen during seasonal influenza. During seasonal epidemics, more than 90% of deaths occur in the frail elderly. The H1N1 virus affected a younger age group in all categories: those most frequently infected, those requiring hospitalization, those requiring intensive care, and those dying from their infection.

A frequent cause of death was viral pneumonia, caused directly by the virus and difficult to treat. During seasonal epidemics, most cases of pneumonia are caused by secondary bacterial infections, which usually respond well to antibiotics. While many of those who died had underlying medical conditions associated with a higher risk, many others who died were previously in good health.

4. The new H1N1 virus rapidly crowded out other circulating influenza viruses and appears to have displaced the older H1N1 virus. This phenomenon is distinctly seen during pandemics.

5. Early studies showed that antibodies to H1N1 seasonal influenza did not protect people from infection with the new virus. This finding provided critical evidence that the virus was new to the human immune system. Later studies in some countries determined that around one third of people older than 65 years had some immunity to the virus. Younger people, however, had no such protective immunity.

Did WHO remove severity from the definition of a pandemic?

WHO regards severity as an important feature of pandemics and a critical factor when deciding on which actions to take. However, WHO has not required a set level of severity as part of its criteria for declaring a pandemic. Experience shows that all pandemics cause excess deaths, that severity can change over time, and that severity can vary according to location and population.

WHO has published three definitions of an influenza pandemic in the context of phases of pandemic alert. These definitions were contained in broader guidelines for pandemic preparedness issued in 1999, 2005 and 2009. Research on influenza pandemics and pandemic viruses increased considerably following the first human cases of infection with the H5N1 avian influenza virus in 1997. Definitions changed over time in line with this evolving knowledge and the need to increase the precision and practical applicability of phase definitions.

The 2009 guidelines, including definitions of a pandemic and the phases leading to its declaration, were finalized in February 2009. The new H1N1 virus was neither on the horizon at that time nor mentioned in the document.

The media make frequent reference to a 2003 document, available on the WHO web site, stating that an influenza pandemic results in "enormous numbers of deaths and illness". At the time, this was considered a likely scenario should the highly lethal H5N1 avian influenza virus develop an ability to spread readily among humans, but it was never a formal definition.

Did WHO exaggerate the threat?

When WHO Director-General Dr Margaret Chan announced the start of the pandemic, on 11 June 2009, she expressed the view that the pandemic would be of moderate severity. She further noted the relatively small number of deaths worldwide, and clearly stated that "we do not expect to see a sudden and dramatic jump in the number of severe or fatal infections."

In every assessment of the pandemic, WHO consistently reminded the public that the overwhelming majority of patients experienced mild symptoms and made a rapid and full recovery, even without medical treatment.

WHO also noted, early on, that influenza viruses are unstable and can undergo rapid and significant mutations, making it difficult to predict whether the moderate impact would be sustained. This uncertainty, which persuaded WHO and many national health authorities to err on the side of caution, was further enforced by the behaviour of past pandemics, which varied in their severity during first and second waves of international spread.

Were any WHO pandemic decisions made to increase industry profits?

No. Allegations that WHO declared a pandemic to boost the profits of the pharmaceutical industry arise from WHO's use of expert advisers and the way declarations of interest from these experts are handled. No evidence of any specific instance of wrongdoing has emerged from recent enquiries.

What safeguards are in place to guard against conflicts of interest?

Potential conflicts of interest are inherent in any relationship between a normative and health development agency, like WHO, and profit-driven industry. Advice from top experts is sought by industry as well as by agencies like WHO that need to issue guidance based on the best expertise. Many experts who advise WHO have ties with industry, and these ties can range from funding to conduct research, to paid consultancies, to participation in conferences sponsored by industry.

WHO has systems in place to protect the Organization from advice biased by commercial interests. WHO requires all expert advisers to declare their professional and financial interests when they participate in advisory groups and consultations. WHO assesses declared interests to determine whether a potential conflict or a potential perception of conflict exists. Where necessary, WHO requests more detailed information and then decides on the appropriate action to be taken.

The publication of summaries of relevant interests following meetings is inconsistent and needs to be made routine. WHO further acknowledges that safeguards surrounding engagement with industry need to be tightened, and is doing so.

What is the function of the Emergency Committee and why have the names of its members not been disclosed?

The International Health Regulations (IHR) contain a set of requirements that are legally binding for WHO and the 194 States Parties of the IHR. The IHR call upon the WHO Director-General to convene an Emergency Committee, drawn from a standing roster of IHR experts, to provide WHO with independent guidance during public health emergencies of international concern, such as an influenza pandemic. The IHR came into force in 2007.

The emergence of the new H1N1 virus prompted the first convening of an Emergency Committee under the IHR. At that time, WHO debated whether or not to publicly disclose the names of members, and faced a dilemma. On one hand, the names of members of other advisory groups are made public after they meet; the identification of persons offering guidance adds transparency to their advice and subsequent WHO decisions. On the other hand, experiences during the SARS outbreak demonstrated the considerable economic and social disruption caused by some public health emergencies, meaning that experts could well be lobbied or pressured for commercial or political reasons, potentially compromising the objectivity of their advice.

After considering these issues, WHO decided to apply its usual practice of disclosing the names of experts after an advisory body has completed its work. The members themselves welcomed this decision as a protective measure, and not as an attempt to veil their deliberations and decisions in secrecy. However, given the duration of the pandemic, the Emergency Committee has held a number of meetings over more than a year, rather than a single meeting like most advisory groups, thus delaying even further the release of the names of its members.

WHO is now fully aware that this decision has fostered suspicion that the Committee might be providing guidance shaped by commercial interests or pressures. Names of members and a summary of relevant declarations of interest will be made public when the Committee advises that the pandemic has ended. Procedures for revealing names of members of future Emergency Committees are under review.

What evidence supports a role for antiviral drugs during an influenza pandemic?

Given widespread population vulnerability to infection, an influenza pandemic presents health authorities with a significant challenge in finding ways to protect populations. From the outset, WHO has recommended a wide range of measures, including hand washing, respiratory hygiene, and not travelling or going to work when ill, and has offered advice on the clinical care of patients and the use of antiviral drugs and vaccines.

At the start of the pandemic, data from the Centers for Disease Control and Prevention (USA) showed that the new virus was sensitive to oseltamivir and zanamivir. Prior to the pandemic, WHO had developed guidelines for the treatment of severe influenza infections caused by the avian H5N1 influenza virus. These two factors allowed WHO to rapidly issue guidelines for use of antivirals in the context of H1N1 pandemic influenza, with emphasis on the treatment and prevention of severe illness.

Over the course of the pandemic, an increasing volume of clinical data has been published in peer-reviewed medical journals. These studies confirm that prompt use of antivirals correlates with improved recovery from illness and fewer deaths. Evidence shows that antivirals have been especially effective for treating patients at increased risk of developing complications from H1N1[1].

February 2010: WHO Guidelines for Pharmacological Management of Pandemic (H1N1) 2009 Influenza and other Influenza Viruses

Was a WHO meeting held in 2002 on influenza vaccines and antiviral drugs influenced by industry?

In 2002, WHO convened a consultation with experts to develop a document, WHO guidelines on the use of vaccines and antivirals during influenza pandemics, which was published in 2004. Some critics have alleged that certain experts who participated in the meeting and the drafting of the guidelines had ties with industry interpreted as conflicts of interest. In line with WHO policy, all experts who participated in this meeting were required to submit a declaration of interest form and all such forms were duly reviewed by WHO. However, a summary of relevant interests was not issued together with the publication. WHO regrets this oversight.

Since that time, a number of administrative and legal changes have been implemented to strengthen procedures for addressing potential conflicts of interest that might influence the advice provided to WHO. WHO is committed to tightening these procedures further and ensuring their more consistent application.

WHO Responds to Critics on Handling of H1N1 Pandemic

WSJ, 10 June 2010 1:24 pm ET

WHO has taken its jabs over how it handled the H1N1, aka swine flu, pandemic. The line of criticism goes like this: WHO hyped a not-very-deadly virus by declaring an influenza pandemic on the advice of people who had financial relationships with drug makers.

The journal BMJ last week published a feature and an editorial criticizing the organization for taking advice from experts with "declarable financial ties with drug companies that were producing antivirals and influenza vaccines," and for failing to name the members of an emergency committee advising officials on when to declare a pandemic.

Margaret Chan, WHO's director-general, responded in a letter to the editors of BMJ Tuesday, saying names of the emergency committee members are always kept confidential until "it's finished its work" to avoid "commercial or other influences." And, she says, while WHO needs to better manage potential conflicts of interest, "At no time, not for one second, did commercial interests enter my decision-making."

Today there was another response from WHO, addressing critics more generally. The group says that H1N1 did indeed meet the criteria for a pandemic, citing its status as a new virus to humans that produced unusual infection, morbidity and mortality patterns. (The notion that a pandemic must include a huge number of deaths and illnesses was never officially part of the definition, WHO says.) Defenders of WHO have also spoken up this week.

On Tuesday, Nature reported that many countries had already placed orders for vaccine before a pandemic was declared. And it said that just three of 22 scientists involved with a 2004 document on the use of antivirals and vaccines during a pandemic had declared conflicts of interest.

The Minnesota Post's Second Opinion blog today quotes Michael Osterholm, director of the University of Minnesota's Center for Infectious Disease Research Policy, who calls some of the criticisms in the BMJ and a similar report "reckless and irresponsible." A bioethics expert from the same university says that while expertise is often found in people with industry ties, WHO needs to make those potential conflicts transparent to everyone.

WHO and pandemic flu. There was also no new subtype

BMJ. 29 June 2010; 340:c3460.
doi: 10.1136/bmj.c3460. PMID: 20587571

Cohen and Carter state that the World Health Organization changed the definition of an influenza pandemic by excluding reference to the words “with enormous numbers of deaths and illness.”[1] However, the WHO also dropped the requirement for a new subtype, meaning that many seasonal flu viruses could be classified as pandemic influenza. A search of online web archives reveals that the WHO website had the erased definition from at least January 2003 to July 2008.[2]

New seroprevalence studies show that substantial proportions of society had pre-existing protective antibodies across age groups. A government study estimates that 1.26 million New Zealanders, or 29%, were immune to the pandemic influenza virus by March 2010.[3]. About 480 000 people had some immunity before the 2009 pandemic wave, mostly in the older age groups. An additional 780 000 were estimated ...

Vaccine global criminal cabal exposed in report

Examiner, 4 July 2010, 9:07 AM
https://web.archive.org/web/20100609143028/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2010m6d4-Vaccine-global-criminal-cabal-exposed

Evidence of the global criminal cabal conducting the H1N1 swine flu vaccine operation was revealed this week. The evidence shows that the World Health Organization (WHO) knew Big Pharma paid swine flu scientists for data used to declare a pandemic.

Millions of people took the swine flu vaccine that drug companies had paid scientists to report were needed and safe, profiting Big Pharma billions of dollars according to the June 3, 2010 investigative report by British Medical Journal and Bureau of Investigative Journalism, the not-for-profit reporting unit.

"The issue of transparency has risen to the forefront of public health debate after dramatic predictions last year about a swine flu pandemic did not come true," reports the Guardian UK.

"The cabinet office has launched an inquiry into the cost to the taxpayer of the panic-buying of drugs.

"Although the experts consulted made no secret of industry ties in other settings, declaring them in research papers and at universities, the WHO itself did not publicly disclose any of these in its seminal 2004 guidance.

"In its note, the WHO advised: 'Countries that are considering the use of antivirals as part of their pandemic response will need to stockpile in advance.'

In January 2010, the Council of Europe launched its investigation into whether the swine flu was faked by World Health Organization (WHO) to boost vaccine manufacturers' profits at the expense of unwitting people globally who obediently took the vaccine.

The inquiry, held in Strasbourg, France, vindicated a worldwide movement of insiders, experts and elected officials who have been persecuted by the global criminal cabal for accusing WHO of fraud by misleading the world into buying and administering millions of dangerous, unnecessary vaccines. (See Niko Kyrikou, *Swine Flu Didn't Fly*, Truthout, Jan. 27, 2009)

Kyrikou writes that as late as January 22, the WHO was still defending its advisory. It "issued a statement calling allegations that it irresponsibly stoked H1N1 fears, 'scientifically wrong and historically incorrect.' The statement defends figures the WHO publicized on transmission rates, mortality and the virulence of swine flu."

'The world is going through a real pandemic. The description of it as a fake is wrong and irresponsible. We welcome any legitimate review process that can improve our work.'

Gary Null, other health experts and health workers filed a lawsuit againt FDA charging that FDA failed to scientifically prove the H1N1 vaccines are safe or efficient. Many of these individuals who uphold the precautionary Hippocratic Oath of "First Do no Harm" have been persecuted through black operations.

In a private conversation with one of the nation's leading health advocates, the writer learned about spying and interrogations that occurred with people interviewed in a documentary exposing high-level corruption.

The global criminal cabal is operating at every level of society, from highest levels down to local health departments that knowingly promote unsafe and unnecessary vaccines.

Kirikou reports, "One high-level, long-term WHO employee, who preferred to remain anonymous for job security, described the WHO as follows:

'WHO is infested by corruption. There is big corruption, like the management of H1N1, and there is small corruption; and between the big and the small corruption there is [corruption] in all imaginable forms. Unfortunately, it's not only the WHO.'"

Tied to the vaccine makers, the Center for Disease Control's PR company used a sophisticated and powerful H1N1 'swine flu' vaccine multimedia marketing campaign to exploit the public, particularly effective on society's most vulnerable.

Also working for the global cabal are network news stations, with few exceptions. This week's report is another clarion call to believe TV "news reporters" at one's own peril.

SPIEGEL Wissenschaft

Cinthia Briseño

Wie die WHO das Vertrauen der Verbraucher verseucht

Spiegel, 11 August 2010, 15.15 Uhr
https://www.spiegel.de/wissenschaft/medizin/schweinegrippe-pandemie-wie-die-who-das-vertrauen-der-verbraucher-verseucht-a-699427.html

Hat die Pharmaindustrie die Schweinegrippepanik mit Zahlungen an Wissenschaftler geschürt? Drei Seuchenexperten der Weltgesundheitsorganisation haben Geld von Konzernen erhalten. Jetzt verteidigt sich die WHO in einem offenen Brief - für Transparenz sorgt sie damit aber nicht.

Diese Reaktion war zu erwarten. Gerichtet war sie an die Redakteure der Fachzeitschrift "British Medical Journal" ("BMJ"). Ein offener Brief, unterzeichnet von Margaret Chan, der Generaldirektorin der Weltgesundheitsorganisation (WHO). Ein Brief, der alle Vorwürfe zerstreuen soll. Vorwürfe, die vor wenigen Tagen publik wurden und erneut den Umgang der WHO mit der Schweinegrippe kritisieren. Chan aber kontert: "Zu keiner Zeit, nicht für eine Sekunde, sind meine Entscheidungen von kommerziellen Interessen beeinflusst worden."

Am Freitag hatte das britische Medizinmagazin zusammen mit der englischen Journalisteninitiative Bureau of Investigative Journalism (BIJ) einen Bericht mit brisantem Inhalt veröffentlicht.
https://www.bmj.com/content/340/bmj.c2912.extract

Das Papier dreht sich im Wesentlichen um eine Entscheidung, die am 11. Juni 2009 fiel und die weltweit weitreichende Folgen mit sich brachte. Es geht um den Tag, an dem die WHO die Schweinegrippe zur Pandemie, einer Seuche der WHO-Stufe 6, erklärte.

In dem Bericht heißt es, einige der Autoren, die an den Richtlinien der WHO zum Umgang mit Grippepandemien mitgewirkt haben, hätten zur gleichen Zeit Geld von den Pharmafirmen GlaxoSmithKline _(GSK) und Roche erhalten. GSK ist Hersteller des Impfstoffs Pandemrix, der gegen die Schweinegrippe zum Einsatz kam. 2007 hatte sich Deutschland dem britischen Konzern gegenüber vertraglich verpflichtet, den GSK-Pandemie-Impfstoff zu kaufen, sobald Phase 6 ausgerufen wird. Roche vertreibt das Grippemedikament Tamiflu (Wirkstoff Oseltamivir).

Vorwürfe dieser Art sind nicht neu. "Für die Regierungen, die WHO und die Pharmaindustrie ist es natürlich ideal, eine harmlose Erkrankung als Weltbedrohung aufzubauen, gemeinsam davon zu profitieren und am Ende sich gegenseitig zu beglückwünschen, wie gut doch durch die enge Zusammenarbeit die Bedrohung abgewendet wurde", hieß es im September 2009 in der Zeitschrift "Der Arzneimittelbrief".

Zahlreiche Geldflüsse

Auch der SPIEGEL berichtete im März diesen Jahres über mögliche Interessenskonflikte: So erhält Roy Anderson, einer der wichtigsten wissenschaftlichen Berater der britischen Regierung von GSK ein Jahresgehalt von mehr als 130.000 Euro - bereits am 1. Mai 2009 erklärte Großbritannien die Schweinegrippe zur Pandemie. Zufall? https://www.spiegel.de/spiegel/a-682149.html

Die Pharmaindustrie finanziert sogar einen eigenen Wissenschaftlerverband, die European Scientific Working Group on Influenza, an deren Spitze Albert Osterhaus vom Erasmus Medical Center in Rotterdam steht. Osterhaus ist einer der einflussreichsten WHO-Berater in Sachen Grippeimpfung.

Seit klar wurde, dass die Schweinegrippe doch weitaus harmloser verlaufen würde, als es die düsteren Prognosen der WHO vorhergesagt hatten, haben WHO-Mitglieder immer wieder beteuern müssen, dass die Pharmaindustrie ihre Entscheidungen nicht beeinflusst habe. Das "BMJ" aber brachte neue Verbindungen ans Tageslicht. Wie etwa die des Mediziners Fred Hayden von der University of Virginia, der 2004 von Roche Honorare für Vorträge und Beratertätigkeiten erhalten habe.

Diese Zahlungen hat Hayden dem "BMJ" gegenüber bestätigt. Pikant: Der Forscher hielt seine Vorträge zu einer Zeit, als die WHO gerade ihre Richtlinien über den Einsatz von Impfstoffen und Medikamenten während einer Grippepandemie veröffentlichte. Eines der Kapitel hatte Hayden verfasst. Darin wird empfohlen, die Länder sollen sich Vorräte an Medikamenten anlegen.

Derartige Interessenskonflikte bestünden bei mindestens drei der Richtlinienautoren, schreibt das "BMJ". In allen drei Fällen konnten die Redakteure nachweisen, dass die Wissenschaftler gleichzeitig zu ihrer WHO-Tätigkeit auf den Gehaltslisten von GSK und Roche standen.

Die Autoren des "BMJ"-Berichts störten sich allerdings nicht so sehr an den Interessenkonflikten an sich. Vielmehr kritisieren sie die mangelnde Transparenz der WHO in Fällen, in denen Influenza-Experten neben ihrer Beratertätigkeit auch Verbindungen zur - von der Grippe profitierenden - Pharmaindustrie unterhalten.

Undurchsichtige Kriterien

Aber hat die WHO von den Interessenskonflikten überhaupt gewusst? Auch das sei nicht klar, heißt es im "BMJ"-Artikel. Ebenso wenig sei offen dargelegt, nach welchen Kriterien die WHO die Experten als Berater zulässt.

Derzeit lässt die beschuldigte Behörde den Umgang mit der Schweinegrippe von unabhängigen Experten überprüfen. "Wir wollen wissen, was gut lief. Wir wollen wissen, was schief lief, und idealerweise warum", sagte Margret Chan im April 2010 in Genf. Der Bericht des 29-köpfigen Expertengremiums wird im kommenden Jahr erwartet. Doch Kritiker bemängeln, dass viele der Mitglieder des Aufsichtsgremiums zugelassene WHO-Berater oder Regierungsmitglieder seien. Die Befürchtung: Das Komitee könnte seine Erkenntnisse weißwaschen.

Die WHO müsse striktere Regeln erstellen, wie man mit Verflechtungen zur Industrie umzugehen habe, räumt Chan in ihrem offenen Brief ein. "Wir tun das bereits." Und doch hinterlässt die Generaldirektorin Zweifel daran. Indem sie etwa weiterhin die 15 Mitglieder des Notfallkomitees geheim hält, das der WHO bei der Einstufung der Pandemie als Berater zur Seite stand. Die Namen dieses Gremiums würden öffentlich gemacht, wenn das Komitee seine Arbeit abgeschlossen habe, schreibt Chan. Das sei von Anfang an so geplant gewesen.

Weiter schreibt die WHO-Chefin, man habe die Namen geheim gehalten, "um die Experten vor kommerziellen und anderen Einflüssen zu schützen." Damit seien die Mitglieder einverstanden gewesen. Zudem habe man die Aufzeichnungen aller Meetings aufgehoben und zusammen mit allen anderen relevanten Dokumenten dem Kontrollgremium zur Verfügung gestellt.

Geheimsache Pandemie

Die "Neue Zürcher Zeitung" schreibt in ihrer Ausgabe vom Mittwoch unter Berufung auf den WHO-Pressesprecher für H1N1, Gregory Hartl, das Notfallgremium werde das nächste Mal im Juli tagen. Möglicherweise wird es dann darüber zu entscheiden haben, ob die Pandemie nun offiziell vorbei ist oder nicht. Bis dahin jedenfalls bleiben die Namen der Mitglieder Geheimsache. Erst in der Mai-Ausgabe des Fachblatts "New England Journal of Medicine" schrieben die WHO-Autoren der Pandemie-Richtlinien in einem Bericht über die Seuche, das Virus sollte noch immer genau betrachtet werden.

In einem Punkt mag Margret Chan Recht haben: Wenn sie sagt, der "BMJ"-Bericht werde bei vielen Lesern den Eindruck erwecken, die Pandemie-Entscheidung sei industriell beeinflusst gewesen. Aber sie bleibt bei ihrem Standpunkt, die Entscheidung, die WHO-Seuchenstufe zu erhöhen, basiere ausschließlich auf klaren virologischen und epidemiologischen Gesichtspunkten.

Virologen und andere Mediziner teilen diese Meinung. Susanne Stöcker, die Sprecherin des Paul-Ehrlich-Instituts (PEI) etwa, glaubt nicht an die Abhängigkeit der WHO-Berater: "Ich bin überzeugt, dass die Pharmaindustrie an Impfungen weniger verdient als an nicht geimpften Menschen, die erkranken", wurde sie kürzlich in "Bild der Wissenschaft" zitiert.

Es ist jetzt an dem unabhängigen Untersuchungskomitee, den Pandemiefall Schweinegrippe gründlich aufzuarbeiten und die richtigen Lehren und Konsequenzen daraus zu ziehen. Transparenz sollte dabei an oberster Stelle stehen. Margret Chan ist immerhin fest entschlossen, die WHO-Richtlinien zu Pandemien zu ändern, wenn das Gremium zu dem entsprechenden Schluss kommt. "Das wäre eine weitere Empfehlung, die wir begrüßen und nach der wir handeln würden."

WHO list reveals flu advisors with financial ties to pharma, vaccine manufacturers

Natural News, 11 August 2010
https://www.naturalnews.com/029441_vaccine_manufacturers_advisors.html

After months of stalling, the World Health Organization (WHO) has finally revealed the names of key pandemic advisors who influenced its decision to declare a phase six pandemic last year – a decision that resulted in a financial windfall for vaccine manufacturers. As you'll see here, that list includes at least five expert advisors received money from vaccine companies.

Here's who received money from Big Pharma and then influenced the WHO decision to declare a pandemic:

Arnold Monto is a professor from the United States who has received money from virtually all the major vaccine manufacturers: GSK, Novartis, Roche, Baxter and Sanofi Pasteur. He has specifically been given grant money by Sanofi Pasteur to study influenza vaccines.

Nancy Cox works for the US Centers for Disease Control, which already maintains a pro-vaccine stance while utterly ignoring the importance of vitamin D in halting infectious disease. Nancy took funds from the International Federation of Pharmaceutical Manufacturers and Associations (IFPMA) to conduct work on vaccines.

John Wood works at Britain's National Institute for Biological Standards and Control (NIBSC). They've taken money from Sanofi Pasteur, Novartis and several other companies focused on influenza vaccine research.

Maria Zambon is a professor at the UK Health Protection Agency Centre for Infection. She has received money from Sanofi, Novartis, CSL, Baxter and GSK.

Neil Ferguson is also a professor, and he has accepted money from Roche and GSK Biologicals.

There may be more to this story, too: The financial ties explained here are merely the ones that these people chose to publicly disclose to WHO. There may yet be other ties that currently remain a secret and will have to be dug up by some determined reporter...

What's the problem with financial ties, anyway?

Why does it matter that WHO advisors took money from vaccine companies? It's simple: The decision to declare H1N1 swine flu to be a phase 6 pandemic was made by the WHO under advisement from these very people who received money from vaccine companies. And that decision, we now know, resulted in a windfall of profits for the vaccine companies.

Those profits, in turn, were burdened by the taxpayers whose expenditures were largely worthless because a huge portion of those vaccines are now expiring and have to be destroyed. The money was wasted, in other words.

It all has the makings of a grand global con: The WHO enlists advisors with financial ties to the vaccine industry to decide whether a pandemic is under way and then conveniently follows their

advice in making a decision that many health experts around the world have been questioning from the start. It all has the appearance of medical corruption, and it looks like WHO decisions are based more on politics than medical science.

It was politically convenient, in other words, to declare a stage six pandemic. And if these WHO advisors have already received money from vaccine manufacturers, it's certainly within the realm of possibility that they would soon be financially rewarded with yet more payoffs. (You scratch my back and I'll scratch yours...)

The appearance of corruption

The unfortunate upshot of all this is that even if these WHO advisors are completely innocent, their financial ties still create the appearance of corruption. And that means the WHO is losing credibility that may compromise its integrity when a real pandemic comes along. If the world can't trust the World Health Organization, in other words, then who should countries look to for real answers on pandemics and infectious disease?

Sadly, even the CDC in the US has now clearly positioned itself as an "anti-nutrition, pro-vaccine" organization, too. Ignoring the huge importance of vitamin D and the support of the human immune system, many CDC experts have also either been on the payrolls of vaccine manufacturers or are looking to join Big Pharma when offered a job. The former head of the CDC, Dr. Julie Gerberding, was recently offered a position as the president of Merck's vaccine division
=> https://www.naturalnews.com/027789_Dr_Julie_Gerberding_Merck.html

The frustrating fact is that modern medicine has been subverted by Big Pharma. The vaccine industry practically runs the CDC and WHO – or at the very least, it heavily influences decisions by these two organizations. As a result, the so-called "scientific" decisions made by these organizations have very little to do with actual science but everything to do with protecting (and expanding) the profits of vaccine manufacturers.

And when public health policy is decided based on corporate profits, the people will always suffer.

Did you notice that the list of WHO advisors did not include even a single naturopathic physician? Not a single holistic nutritionist? There was nobody on the board that brought a pro-nutrition point of view to the discussions. And you know why nutritionists and naturopaths weren't invited to join the WHO advisory board? Because the WHO has already pre-decided it doesn't want to hear those points of view. It has stubbornly decided to entertain only vaccines as the solution to virtually all infectious disease.

And if you only invite vaccine pushers to the table, guess what kind of advice you're going to get? "Push more vaccines!"

Asking a bunch of vaccine experts whether you should declare a pandemic is sort of like asking your insurance agent whether you need more insurance. Well of course you do!

No wonder the WHO has lost so much credibility. It refuses to look at real solutions that might work for poor nations (such as low-cost vitamin D supplements) while strongly favoring the high-profit operations of the vaccine industry. That's why the WHO simply can't be trusted anymore. It has now become a pawn of the pharmaceutical industry that will always make decisions that favor the financial interests of Big Pharma.

See the WHO list of advisors here: => see below

Julia Medew

Call to examine connections of swine flu experts

Brisbane Times, 13 August 2010, 3.00 am
http://www.brisbanetimes.com.au/national/call-to-examine-connections-of-swine-flu-experts-20100812-121i6.html

An Independent inquiry should look at Australia's swine flu pandemic response, including whether expert advisers had conflicts of interest involving drug companies, an infectious disease expert has said.

Professor Peter Collignon from the Australian National University said pharmaceutical companies could have influenced the government's response to the pandemic last year, especially if its advisers had worked with the industry.

He said the government should release the names of all the advisers it relied on during the pandemic, including their previous and current dealings with pharmaceutical companies to ensure transparency.

"A lot of people who make decisions indirectly are involved in pharmaceutical companies doing the research for them or whatever, so it's very difficult to separate conflicts of interests in the decision makers," Professor Collignon said. "What we need is very transparent dealings. Those on the committees making decisions, we need to know who they are and the details of what contacts they have with the pharmaceutical industry."

The call came as the World Health Organisation revealed that five of its 15 pandemic experts had received support from the industry, including for flu vaccine research.

A spokeswoman for the Federal Department of Health said she would not name the more than 50 experts who had contributed to the government's response because it was standard practice for them "to agree to confidentiality and conflict of interest provisions".

The spokeswoman said a thorough review of Australia's response, including lessons learned, would be made public. She would not say whether the review would be independent.

After repeated calls for the WHO to release the details of its advisers, it published a list of the 15 members of its emergency committee headed by Australian tropical diseases professor John Mackenzie - the only member named during the outbreak.

The advisers came from Africa, Asia, Europe, Latin and North America, the list posted on the WHO's website showed.

Most were scientific researchers and epidemiologists, along with a Senegalese diplomat, public health officials from Thailand and Chile and two specialists on international air travel and health.

Critics had raised concerns about potential conflicts of interest that might have helped the drugs industry influence decisions on huge orders for special vaccines against A(H1N1) flu.

The WHO has always denied those claims, underlining that it had vetted members and maintained secrecy over their identities to protect them from undue pressure during the outbreak.

Mail Online

Sophie Borland

Swine flu advisers' ties to drug firms: Five WHO experts linked with vaccine producers

Daily Mail, 13 August 2010, 07:34 BST
https://www.dailymail.co.uk/health/article-1302505/WHO-swine-flu-advisers-ties-drug-firms-Experts-linked-vaccine-producers.html

A third of the experts advising the World Health Organisation about the swine flu pandemic had ties to drugs firms, it has emerged. Five of the 15 specialists who sat on the emergency committee had received funding from pharmaceutical giants, or were linked to them through their research. The revelation will prompt speculation that the 'pandemic' was wildly overestimated and largely fuelled by the drugs industry who stood to benefit from the panic.

Last month it emerged that the Government had squandered more than £1.2 billion tackling swine flu - most of it going towards vaccines following experts' dire predictions that as many as 65,000 Britons would die. In fact the virus claimed just 457 lives - a third of those killed every year by ordinary seasonal flu.

But today it emerged that many of the scientists on the WHO's emergency panel had links with firms including GlaxoSmithKline, who made millions manufacturing swine flu vaccines. It follows revelations by the Daily Mail earlier this year that more than half of the scientists advising the British Government's own taskforce on the pandemic had links to drugs giants.

One of the 15 scientists advising the WHO was British professor N**eil Ferguson -** who last year warned the pandemic would be so bad all schools would need to close. It has since emerged that Professor Ferguson had acted as a consultant for Roche, who makes Tamiflu, as well as GSK Biologicals until 2007.

Professor **Maria Zambon**, who was also on the panel, from UK Health Protection Agency's Centre for Infection, said she received funding from several vaccine makers, including Sanofi, Novartis, CSL, Baxter and GSK. During the outbreak last year Professor Zambon warned that up to a third of school children in Britain had the virus without knowing as they did not have symptoms.

Meanwhile US professor **Arnold Monto** admitted he had done research for GlaxoSmithKline, Baxter, the two firms contracted to make the jabs, as well as Roche, which makes Tamiflu. He had also done work for two other large firms Novartis and Sanofi Pasteur.

Critics warned that there was serious conflict of interest amongst these experts whose advice had led to the waste of vast sums of taxpayer's money. Labour MP Paul Flynn said: 'A year ago, these experts told us the world was facing a grave health emergency. 'On this occasion, regrettably, they got it wrong: their advice led WHO, the EU and national governments to vastly overrate the seriousness of the H1N1 epidemic, wasting large sums of public money and scaring the world unnecessarily.

'With such conflicting pressures, we need to be absolutely certain that the advice of such experts is based on solid scientific evidence and is driven solely by the need to protect public health. The only way to do that is through total transparency.

'When a future pandemic is declared, the public has a right to know, from the outset, who is recommending such a drastic step – as well as any links they may have to the pharmaceutical industry, which stands to profit from such a recommendation.'

Another expert **Nancy Cox**, from the US Centers for Disease Control, admitted she had received funding from the drugs industry group, the International Federation of Pharmaceutical Manufacturers and Associations (IFPMA) for flu vaccine research and work on viruses.

British scientist **John Wood** admitted that his research unit at Britain's National Institute for Biological Standards and Control (NIBSC), had undertaken work for Sanofi Pasteur, CSL, IFPMA, Novartis and Powdermed on influenza vaccine.

The panel were instrumental in advising the WHO to officially declare swine flu as the first pandemic in 40 years last June.

Earlier this year it emerged that 11 of the 20 members of the Scientific Advisory Group for Emergencies, which advised the British Government on swine flu, had done work for the pharmaceutical industry or were linked to it through their universities.

A spokesman for the WHO denied that the experts' work gave rise to a conflict of interest.

Why the Corruption of the World Health Organization (WHO) is the Biggest Threat to the World's Public Health of Our Time

J Integrative Med Ther, January 2015, 2(1): 1-5
DOI: 10.13188/2378-1343.1000004

Abstract

In the scientific community it is generally accepted that metaanalyses are more accurate than single studies and independent studies more trustworthy than industrial studies.

It is therefore understandable that Cochrane reviews, meta-analyses based on rigid protocol and independent origin, have the highest quality in medical research.

It is therefore unfortunate that Cochrane reviews seems systematically to conflict with the information and recommendations from the World Health Organization (WHO).

A number of the drugs and vaccines recommended by WHO, especially the drugs used in psychiatry, are in Cochrane reviews found to be harmful and without significant clinical effect. Since whose recommendations are followed by many people in the member states, it could indeed lead to patients getting the wrong medication and many patients have severe adverse effects, because of these drugs.

To solve this serious public health problem it is recommended to revise the WHO-system, which in fact has been proven weak to the interests of the pharmaceutical industry.

We therefore believe that the WHO's recommendations regarding medicine in its "list of essential medicines" and other drug directories are biased and not reliable as a source of information on medicine

...

The 2009 Pandemic (Swine Flu)

...

Conclusions

Today a&er the Swine Flu Scandal it seems that the pharmaceutical industry has gained control over the WHO system, leading to an extreme bias towards the use of not only ine%ective and unnecessary in$uenza vaccines and medicines, but also to the use of antipsychotics, antidepressant, antianxiety and other psychopharmacological drugs, cytotoxic anti-cancer chemotherapy, and a number of other drugs,which according to independent meta analyses and Cochrane reviews are found to be without signi!cant bene!cial effect – and ofen harmful.

We recommend a fundamental revision of the WHO-system that has proven itself weak to the interests of the pharmaceutical industry.

Channel 4 News exposes Swine Flu scandal in 2010

YouTube, 15 September 2020.
https://www.youtube.com/watch?v=q9qeLcq3y8w

Channel 4's John Snow reports on the Council of Europe's investigation into the manufactured swine flu hoax. The former Chair of the Sub-committee on Health of the Parliamentary Assembly Dr Wolfgan...

Channel 4's John Snow reports on the Council of Europe's investigation into the manufactured swine flu hoax. The former Chair of the Sub-committee on Health of the Parliamentary Assembly Dr Wolfgang Wodarg had accused the World Health Organization (WHO) of lowering the definition of a pandemic in order for the pharmaceutical companies and their shareholders to rake in massive at the expense of tax payers in targeted countries.

[There is a Transcript]

It is one of the greatest medical scandals of the century according to a leading health expert in Brussels the council of Europe. Health chief has accused major pharmaceutical firms of organizing a campaign of panic and unduly influencing world health organization decisions and with European countries now burdened with bills for millions of unwanted doses of the swine flu vaccine he wants an investigation.

Our science correspondent Tom Clark has this report flu viruses can spread 64 000 people dead tens of thousands hospitalized a country crippled by a virus the prediction to the impact of swine flu on Britain were grim the government's response spending hundreds of millions of pounds on antiviral drugs and vaccines adverts and leaflets. But 10 months into the pandemic only 355 Britons have died and globally the virus hasn't lived up to our fears were governments misled into preparing for the worst politicians.

In Brussels are now asking for an investigation into the role pharmaceutical companies played in influencing political decisions that led to a swine flu spending spree. There must be a process to get more transparency how the decisions in the in the who Harvard function and who is influencing the decisions of the who and what is the role of pharmaceutical industry there. I'm very suspicious about the processes which are behind this pandemic.

The council of Europe committee want the investigation to focus on the world health organization's decision to lower the threshold required for a pandemic to be formally declared. The world is now at the start of the 2009 influencer pandemic when this happened in June last year, governments had to activate huge pre-prepared contracts for drugs and vaccines with manufacturers.

They also want to probe ties between key who advisers and drug companies who is deciding what the risk is this is the pharmaceutical companies who want to sell drugs or is it someone making a decision based on the perceived danger. In this case it appears that the danger was vastly exaggerated and wasn't exaggerated by the pharmaceutical companies in order to make money.

Our government like many others is now paying the price for being prepared citing commercial confidentiality. The department of health won't actually tell us how much swine flu vaccine they actually ordered but it's thought contracts were signed for 90 million doses yet fewer than 4 million people in the UK have actually had the jab. Officials here are now in negotiation with their key supplier black so smith cline to see if they can't rewrite that very expensive contract.

Britain is now trying to cancel orders for 60 million doses of the jab but we're not the only country awash with vaccine. France ordered 94 million doses it's now trying to cancel contracts for 50 million of those. Germany is trying to cancel orders for 25 million doses and the Netherlands has announced it will sell 19 million of the 34 million vaccines it's ordered last month. An investigation by channel 4 news raised serious questions about the government's decision to order millions of doses of the drug Tamiflu and the possibility of pharmaceutical industry influence on decision-making. Today the department of health defended its pandemic purchasing decisions telling us in a statement they were based on independent scientific advice to ensure the country against the worst possible effects of a pandemic.

State of Emergency over the Swine Flu?!?

TN Sons of Liberty Blog, 24 October 2009

https://web.archive.org/web/20210126193508/http://tnsonsofliberty.blogspot.com/2009/10/state-of-emergency-over-swine-flu.html

Here is an excerpt from the Infowars article on Obama's declaration of National Emergency over the Swine Flu:

"U.S. President Barack Obama has signed a proclamation declaring 2009 H1N1 swine flu a national emergency, the White House said on Saturday.

The proclamation, which Obama signed on Friday night, will make it easier for U.S. medical facilities to handle a surge in flu patients by allowing the waiver of some requirements of Medicare, Medicaid and other federal health insurance programs as needed, the White House said in a statement.

The U.S. Centers for Disease Control and Prevention said on Friday that H1N1 swine flu has become widespread in 46 of the 50 U.S. states, a level comparable to the peak of ordinary flu seasons but far earlier and with more waves of infection expected.

The White House statement said the declaration was intended to prepare the country in case of "a rapid increase in illness that may overburden health care resources" and was similar to disaster declarations issued before hurricanes hit coastal areas.

Seasonal flu normally peaks sometime between late November and early March. Swine flu has hit young adults and children the hardest, while seasonal flu normally is more dangerous for people over age 65. H1N1 has killed more than 1,000 Americans and put more than 20,000 in the hospital in the United States since it emerged earlier this year, the CDC said. But health officials are quick to note that the actual number of cases cannot be measured.

Even though the H1N1 pandemic appears to have peaked out, U.S. President Barack Obama has now declared a national emergency over swine flu infections. The reasoning behind such a declaration? According to the White House, it's designed to "allow hospitals to better handle the surge in patients" by allowing them to bypass certain federal laws.

Emergency powers trump the Bill of Rights

That's the public explanation for this, but the real agenda behind this declaration may be far more sinister. Declaring a national emergency immediately gives federal authorities dangerous new powers that can now be enforced at gunpoint, including:

• The power to force mandatory swine flu vaccinations on the entire population.

• The power to arrest, quarantine or "involuntarily transport" anyone who refuses a swine flu vaccination.

• The power to quarantine an entire city and halt all travel in or out of that city.

• The power to enter any home or office without a search warrant and order the destruction of any belongings or structures deemed to be a threat to public health.

• The effective nullification of the Bill of Rights. Your right to due process, to being safe from government search and seizure, and to remain silent to avoid self-incrimination are all null and void under a Presidential declaration of a national emergency."

Update: There is no emergency. I assure you that the Swine Flu has been relatively mild. I have taken care of over 100+ patients with the Swine Flu and I did not get infected. There have been deaths from the Swine Flu. Three deaths that are possibly linked to the Swine Flu in Tennessee. They have not been confirmed, only suspected.

Let's put this 'national emergency' in perspective. In 2008 Tuberculosis killed 1.7 million people worldwide. In 2008 The Regular/Seasonal Flu killed 30,000 people worldwide according to the CDC. It is almost Spring in Australia right now, and their Swine Flu/Regular Flu season is winding down... They had 200 deaths from the Swine Flu in a population of 22 million.

The majority of stories on Mass Media Television (Fox, ABC, CNN) are reporting shortages of the Swine Flu Vaccine. They report long waits at the Health Clinics. They show Americans smiling and waiting, old, young, children, and pregnant women standing in endless lines. They show smiling nurses giving shots, and Doctors with grave expressions endorsing the Swine Flu vaccines and stating how it is your responsibility as a good citizen to get your shot.

The recent reporting on the *shortage of the swine flu vaccine*... Is because no one wants to get vaccinated! A lot of people I talk to ... Doctors, nurses, teachers...will not take the vaccine. They feel it is dangerous, rushed, and it is unnecessary due to the mildness of the Swine Flu illness.

In order to increase vaccinations the general public must be *scared into* taking their shots. Thus, more stories of vaccine shortages, artificially created numbers of Swine Flu deaths, and no coverage of Medical Professionals who speak out against the Swine Flu Vaccine and the potential dangers associated with it.

The Federal Govt. does not want to lose money off of this...They have signed several multi million dollar contracts with various drug companies to manufacture and distribute these vaccines. What are they going to do with unused vaccines? It would be a public relations nightmare and financial folly if the majority of Americans refused the vaccine.

One more thing on the Swine Flu and Pregnancy...Do you recall the recent hype for Pregnant women to get their Swine Flu Vaccine? I have talked to local OB and ER physicians who highly recommended that pregnant women get the Swine flu Vaccine and have seen many Mainstream Media News reports stating that the Swine Flu was especially targeting Pregnant Women and they should definitely be vaccinated...despite the fact that many drugs...Alcohol, certain narcotics,certain antibiotics are very dangerous for a pregnant woman to take...and cross the fetal placenta barrier and can harm/kill the unborn child. *So why would you take a rushed unneccessary vaccine*:

sanofi pasteur	**10 September 2009_v0.3**
449/454 Influenza A (H1N1) 2009 Monovalent Vaccine	**LE5860-5862**

Here is a quote from the package insert of the H1N1 vaccine:

8.1 Pregnancy
"Pregnancy Category C: Animal reproduction studies have not been conducted with influenza A (H1N1) 2009 Monovalent Vaccine or Fluzone vaccine. It is also not known whether these vaccines can cause fetal harm when adminstered to a pregnant woman or can affect reproduction capacity. Influenza A (H1N1) 2009 Monovalent Vaccine should be given to a pregnant woman only if clearly needed."

Obama declares swine flu a national emergency

The Los Angeles Times, 25 October 2009, 12 AM PT
https://www.latimes.com/archives/la-xpm-2009-oct-25-na-national-flu-emergency25-story.html

Washington – President Obama on Saturday declared the swine flu outbreak a national emergency, a procedural step designed to allow healthcare providers to speed treatment and slow the spread of the disease.

The action gives Secretary of Health and Human Services Kathleen Sebelius temporary authority to grant waivers that would expedite steps such as setting up off-site emergency rooms to treat potential flu victims apart from other patients.

Administration officials said the move was not made as a result of any particular development, but as a preemptive measure to ensure that the tools for a quick response were in place.

"The potential exists for the pandemic to overburden healthcare resources in some localities," the White House announcement said. "Thus, in recognition of the continuing progression of the pandemic, and in further preparation as a nation, we are taking additional steps to facilitate our response."

According to the Centers for Disease Control and Prevention, 46 states have reported widespread incidence of the swine flu, also known as H1N1. Since the outbreak of the pandemic in April, there have been more than 20,000 hospitalizations from laboratory-confirmed infections and more than 1,000 deaths.

The declaration is the second step in the government's response effort. In late April, HHS declared a public health emergency, which allowed the government to release antiviral medications from federal stockpiles to states that might need them.

The national emergency declaration allows Sebelius, on a case-by-case basis, to waive federal rules governing routine medical operations if requested by doctors or hospitals.

For example, to isolate infected patients, some hospitals are planning to establish separate treatment locations in off-site tents or community centers. But without a waiver of current rules, the hospital may not get federal reimbursement if the facility is too far from its property. Hospitals could also ask for a waiver of paperwork procedures if they are besieged by flu patients.

"If there's a surge in patients, you want to be able to put in place more efficient methods of triaging and treating people," said Reid Cherlin, a White House spokesman. "It's a priority for providers not to have to waste time on the phone with federal managers."

THE FLU CASE

German "swine flu" jab campaign to start with government officials today

DDP // The Flu Case, 25 Oktober 2009, 13:46 Uhr

https://web.archive.org/web/20091031085952/http://www.theflucase.com/index.php?option=com_content&view=article&id=1372%3Agerman-qswine-fluq-jab-campaign-to-start-with-government-officials-today&catid=1%3Alatest-news&Itemid=64&lang=en

München (ddp). In Deutschland beginnt am Montag (26. Oktober) die Impfung gegen die Schweinegrippe. Das Bundesgesundheitsministerium hatte vor wenigen Tagen die Bevölkerung aufgerufen, sich an der größten Impfaktion in der Geschichte der Bundesrepublik zu beteiligen.

Nach Behördenangaben werden zunächst die wichtigsten Funktionsträger, die Angehörigen von Bundeswehr, Bundespolizei und der Krisenstäbe sowie die Beschäftigten in Krankenhäusern, Arztpraxen und Laboren immunisiert. Danach ist die Impfung gefährdeter Gruppen vorgesehen, zu denen nach Ministeriumsangaben 30 Prozent der Bevölkerung gehören. Ab Ende November können sich dann voraussichtlich auch alle anderen impfen lassen.

Das Berliner Robert-Koch-Institut (RKI) hatte zuletzt mitgeteilt, dass die Zahl der gemeldeten Schweinegrippe-Fälle wieder auf fast 1600 innerhalb einer Woche angestiegen ist. Das seien doppelt so viele wie im Frühherbst, als es 700 bis 800 neue Fälle wöchentlich waren. Nach RKI-Angaben gab es bislang 25 000 Fälle der sogenannten Neuen Grippe in Deutschland, darunter drei Todesfälle.

Kinder im Alter zwischen sechs Monaten und zehn Jahren erhalten zwei Impfungen mit jeweils der halben Dosis, die 10- bis 60-Jährigen werden zunächst einmal geimpft, die älteren Menschen zweimal. Ende Januar sollen die Impfungen bundesweit abgeschlossen sein.

Der Vorsitzende der Ständigen Impfkommission (STIKO), Friedrich Hofmann, forderte am Wochenende die Ärzte auf, sich unabhängig von ihrer persönlichen Meinung impfen zu lassen. Schließlich trage medizinisches Personal eine besondere Verantwortung gegenüber jenen häufig immungeschwächten Patienten, mit denen es in Kontakt komme, sagte er dem Nachrichtenmagazin «Focus». Hofmann argumentierte: «Ein Arzt kann Virusträger sein und ungewollt Menschen anstecken, denen die Infektion mehr zu schaffen macht.» In den vergangenen Wochen hatten Ärztevertreter nicht nur die dem Impfstoff beigemengte Verstärkersubstanz, sondern auch die Notwendigkeit der Aktion selbst in Frage gestellt.

=>

German "swine flu" jab campaign to start with government officials today

The mass "swine flu" vaccine campaign is starting in Germany, today, Monday, October 25th with government officials, the German military, police and members of pandemic crisis committees to receive Baxter's Celvapan.

Baxter dropped mercury and squalene from its "swine flu" jab mix at the last moment apparently following protests from the German army and states.

Baxter's Austrian facility contaminated 72 kilos of seasonal flu with the live bird flu virus this February in an act that indicates criminal intent because of the need for the company to adhere to biosafety level three regulations when handling the bird flu virus supplied by WHO.

Because no substantial inquiry or overhaul of Baxter's safety procedures was made, another case of contamination cannot be ruled out.

Also, there are reports that nanochips have been inserted into the "swine flu" jab or syringe.

Richard Knox

Swine Flu Vaccine Shortage: Why?

NPR, 26 October 2009, 6:00 AM ET
https://www.npr.org/2009/10/26/114156775/swine-flu-vaccine-shortage-why

Millions of Americans already have been infected with swine flu. Forty-six states have widespread flu, and the president has declared a national emergency. But only recently have U.S. health officials discovered why manufacturers can't deliver as much swine flue vaccine as expected.

Officials at the Centers for Disease Control and Prevention say for months, the companies didn't realize how far short their vaccine "yields" were falling. That's because they didn't have the chemicals – called reagents – that would have told them how much active ingredient they had in their vaccine production vats.

"To really understand how much product you have, you need to do potency tests," says Dr. Anne Schuchat, chief of the CDC's National Center for Immunization and Respiratory Diseases. She says reliable tests used to measure potency were delayed.

"When they were run, the manufacturers basically found out that the product they had was actually less than they thought they had," Schuchat said in an interview with NPR. "That wasn't something we knew a long time ago. That's relatively recent."

NPR's Robert Krulwich and medical animator David Bolinsky explain how a flu virus can trick a single cell into making a million more viruses.

On top of that, there were glitches in new machines manufacturers installed to put vaccine in vials and package the vials. So there was an unexpected bottleneck in the so-called fill-and-finish part of getting vaccine out the door.

The CDC didn't realize the combined effect of these problems until mid-October. That's when it revised its projected swine flu vaccine delivery dates downward.

The problems have left local public health officials frustrated and bewildered.

"The vaccine situation is quite frustrating," says Dr. Jonathan Fielding, the health commissioner for Los Angeles County.

"The numbers we were asked to anticipate and plan for have turned out to be gross overestimates of what has been supplied to us," Fielding says. "I don't understand what the issues are with the manufacturers, that from one week to the next they can't give us more accurate estimates."

Los Angeles County got its first delivery of vaccine against the new H1N1 flu last week. It got 300,000 doses for a city of 10 million, with no real idea of when to expect more. Two-thirds went to private health care providers, one-third to free public clinics.

Fielding says before now the county canceled dozens of vaccine clinics. When the first ones opened this past weekend, demand was brisk. People had to wait up to three hours to get a flu shot, and Fielding says he saw few people drop out of line.

Vaccine yield problems with swine flu are not new. Last July, vaccine manufacturers reported problems in growing the new H1N1 virus - or, rather, a hybrid of the swine flu virus and a standard vaccine virus strain - in chicken eggs. That's a crucial step in the current technology for making flu vaccines.

However, CDC scientists thought those problems had been overcome. Unfortunately, not so. *The Wall Street Journal* reported on Saturday that some vaccine manufacturers have had only one-fifth the viral yield from chicken eggs that they expected.

Some manufacturers are reportedly working with a different "seed" strain of vaccine virus that gives better yields.

Meanwhile, the flu virus is spreading rapidly. No one knows when to expect the crest of this wave of the swine flu pandemic — the second wave since the new virus first appeared last April. Scientists at the University of Washington predict it will be sometime in November. Others decline to make projections.

Vaccine production won't be able to catch up very soon. The CDC's Schuchat says that raises an obvious question.

"People wonder whether, when the vaccine is available for you or those in your family, will it be too late for that vaccine to give you any benefit?" she acknowledges.

"It's hard to make an argument that the vaccine is going to protect very many people at the rate it's coming out," says Dr. Marc Lipsitch of the Harvard School of Public Health, a CDC consultant. "Much of this wave will be over by the time most Americans have access to the vaccine."

Schuchat disagrees. She says even when this wave of swine flu peaks, there will still be time for many people to get vaccinated.

"A key point is that when the peak occurs in any one area, half the people who are going to become infected haven't yet become infected," Schuchat says.

Fielding, the Los Angeles County health commissioner, thinks Schuchat is right.

"I don't think it's too little, too late," Fielding says. "I think it's too little. Obviously for people who get sick or who get very seriously ill, it's too late. But for many others, I think it's going to arrive in time to help prevent disease."

Dr. Donald Burke, dean of the University of Pittsburgh's School of Public Health, thinks swine flu vaccine will not come in time to protect most Americans against the current wave of infection. But he thinks there is a "very real possibility" of a third wave of swine flu in December or after the first of the year.

"So even if we see a peak now, I will stand with the recommendation to get vaccinated," Burke says. Some think if enough children get vaccinated in November and December, that could prevent or blunt a third wave.

But CDC officials are currently chary of predicting when the vaccine will be available in quantities sufficient to protect the 159 million Americans who are considered at highest risk of the new H1N1 flu.

"Given how far off some of the projections have been from what we have now," CDC director Thomas Frieden said ruefully last week, "I would prefer to just take it one day at a time, one week at a time."

LE MATIN.ch

Victor Fingal

Onze millions de doses en trop

Le Matin, 26 octobre 2009, 22h34
https://web.archive.org/web/20091029093529/http://www.lematin.ch/actu/suisse/onze-millions-doses-183278

Il suffirait de vacciner deux millions de personnes en Suisse pour faire face à la grippe A. Mais l'Office fédéral de la santé publique a commandé 13 millions de doses dont on ne sait que faire.

Le vaccin contre la grippe A s'apprête à débarquer en Suisse au début du mois prochain. Mais il traîne avec lui une odeur de soufre. Déjà l'Office fédéral de la santé publique (OFSP) ploie sous la critique: pourquoi avoir commandé 13 millions de doses pour 7,5 millions d'habitants alors que le même office recommande aujourd'hui de faire vacciner uniquement deux millions de personnes (professionnels de la santé, enfants, malades chroniques, etc.)? Sans parler de la mauvaise adhésion du public au vaccin: des récents sondages affirment que dans le meilleur des cas seule la moitié de la population accepterait de se faire immuniser contre le virus H1N1.

Un vrai scandale du point de vue de Beda Stadler, directeur de l'Institut d'immunologie de l'Hôpital de l'Ile à Berne: «Nous savons aujourd'hui qu'un seul vaccin par personne suffit et qu'il n'est plus besoin de vacciner la population entière. Que va-t-on faire des stocks restants?»

Cette question, nous avons voulu la poser directement à l'OFSP. «Nous ne pouvons pas répondre aujourd'hui, affirme sans sourciller Jean-Louis Zürcher, responsable de la communication de l'OFSP. Nous dévoilerons seulement vendredi notre stratégie. Peut-être faudra-t-il vacciner quand même toute la population.»

Privilège de pays riche

Pour l'OFSP, pas question de jouer avec la sécurité. La Suisse doit se réserver la possibilité de pouvoir vacciner deux fois contre la grippe A, si besoin. Histoire d'être prêt pour le cas où le virus deviendrait plus virulent. Claire-Anne Siegrist, professeure aux Hôpitaux universitaires de Genève et présidente de la Commission fédérale pour les vaccinations, avait même avoué à 24 heures que «c'est un privilège de pays riche».

Ahurissant. Depuis des mois des scientifiques du monde entier - l'Organisation mondiale de la santé en tête - s'accordent pour affirmer que la grippe A est passée de meurtrière à bénigne. Le professeur français Bernard Debré avançait même la thèse que la grippe A était «peut-être même un peu moins dangereuse que la grippe saisonnière».

Face à cette réalité, l'OFSP refuse encore d'admettre qu'il s'est fourvoyé, alors que même des défenseurs d'horizons politiques aussi différents que le conseiller national PLR Christian Lüscher ou son collègue sous la Coupole, le médecin socialiste Jean-Charles Rielle, estiment que l'office «a peut-être péché par excès de précaution».

Sans jouer sur les mots, une autre réalité se dessine. La campagne de prévention, les vaccinations et les hospitalisations vont coûter dans les 130 millions de francs, dont 84 uniquement pour les doses. Le tout à la charge du contribuable. Deux contrats ont été signés avec les laboratoires de Novartis et

avec ceux du britannique GlaxoSmithKline. Mais les clauses de ces contrats sont suffisamment bien gardées pour que l'on ne sache pas si la Suisse s'est engagée définitivement à acheter les 13 millions de doses.

La suisse ne produit plus de vaccins

D'autres pays ont opté pour une solution plus intelligente et n'hésitent pas à le faire savoir (lire encadré). Ainsi en Autriche, une première distribution de 500'000 doses est livrée actuellement, mais Vienne s'est réservé une option pour la livraison d'un maximum de 16 millions de doses. Une clause qui n'a pas besoin d'être honorée si le besoin ne s'en fait pas sentir.

«La Suisse ne serait pas placée dans une situation inconfortable si elle n'avait pas abandonné, il y a quelques années, la fabrication de vaccins», souligne Beda Stadler. En clair, les doses sont concoctées par des laboratoires situés à l'étranger. Mais ce handicap n'aurait quand même pas obligé la Suisse à signer un contrat portant sur 13 millions de doses. «La technique de fabrication de ces vaccins, poursuit le directeur de l'institut bernois, est basée sur une technique des oeufs embryonnés. La production se fait au fur et à mesure et peut être arrêtée à tout moment.»

Est-ce qu'on en fait trop?

Reste que trop de précautions provoquent aussi des dégâts collatéraux. D'après le Pr Bernard Hirschel, chef de l'unité VIH-sida aux HUG, qui avait posé la question lors d'un colloque de médecins: «Pensez-vous que l'on en fait trop au sujet de la grippe A?» La réponse avait fusé: oui à 72%. «Nous avons pourtant des précédents avec d'autres craintes, souligne le professeur. Des agriculteurs ont perdu des cheptels entiers, le travail de leur vie, quand on a abattu des troupeaux inutilement à cause de la peur de la vache folle.»

THE FLU CASE

Swiss controversy regarding the need to vaccinate against "swine flu"

The Flu Case, 27 October 2009

https://web.archive.org/web/20091031090604/http://www.theflucase.com/index.php?option=com_content&view=article&id=1418%3Aswiss-controversy-regarding-the-need-to-vaccinate-against-qswine-fluq&catid=1%3Alatest-news&Itemid=64&lang=en

The Swiss newspaper Le Matin has criticised the decision by the government to buy 13 million doses of "swine flu" vaccination for the population of 7.5 million people when health experts have said that vaccines for two million people would be enough to stop the "swine flu pandemic.

In addition, the newspaper notes that the contracts that the Swiss government has sealed with the pharmaceutical companies Novartis and GlaxoSmithKline are confidential and no one knows what the precise terms and conditions surrounding the purchase of the vaccines from factories located outside Switzerland are.

Le Matin estimates that the vaccination campaign could cost as much as 130 million francs, with the vaccines alone costing 84 million francs.

Recent polls show that only half the Swiss people at most have said that they would be willing to take the "swine flu" jab.

Bedda Stadler, Director of the Institute of Immunolog at the l'Hôpital de l'Ile in Berne said: "We know today that one vaccine for each person will be enough and there is no need to vaccinate the entire population. What are we going to do with all the surplus stocks?"

Jean-Louis Zürcher of the Swiss federal government's public health office did not give Le Matin

TIME

Tristana Moore

In Germany, a Better Vaccine for Politicians?

Time, 27 October 2009
https://content.time.com/time/health/article/0,8599,1932366,00.html

Critics are calling it a two-tier health system – one for the politically well connected, another for the hoi polloi. As Germany launched its mass-vaccination program against the H1N1 flu virus on Monday, the government found itself fending off accusations of favoritism because it was offering one vaccine believed to have fewer side effects to civil servants, politicians and soldiers, and another, potentially riskier vaccine to everyone else. The government had hoped that Germans would rush to health clinics to receive vaccinations against the rapidly spreading disease, but now rising anger over the different drugs may cause many people to shy away.

Amid growing fears of a possible global flu pandemic, the German government prepared for its mass-vaccination campaign earlier this year by ordering 50 million doses of the Pandemrix vaccine, enough for a double dose for 25 million people, about a third of the population. The vaccine, manufactured by GlaxoSmithKline, contains an immunity-enhancing chemical compound, known as an adjuvant, whose side effects are not yet entirely known. Then, after a report was leaked to the German media last week, the Interior Ministry confirmed that it had ordered a different vaccine, Celvapan, for government officials and the military. Celvapan, which is made by U.S. pharmaceutical giant Baxter, does not contain an adjuvant and is believed to have fewer side effects than Pandemrix.

Anger at the news was widespread in Germany. "If mass vaccination is considered to be necessary, then everyone should be treated the same way," says Birgitt Bender, health spokeswoman for the Green Party. Ulrike Mascher, head of the VdK social-welfare association, says giving government officials a vaccine that's different from that given to the rest of the population sent the "wrong signal" and gives many people "the impression that they are second-class patients." A story on the front page of the mass-circulation *Bild* newspaper accused the government of giving "second-class medicine" to regular Germans.

Doctors and medical experts are divided over the safety of Pandemrix. While some say it's the best vaccine available, others have serious misgivings about it. "The Pandemrix vaccine can't be recommended for pregnant women or young children because it has an increased risk of side effects. Pandemrix has an adjuvant which hasn't been tested sufficiently up until now," Alexander Kekulé, a virologist at the University of Halle, tells TIME. "Celvapan is a whole-virus vaccine, which has fewer side effects than Pandemrix, but it leads more often to fever or local swelling when compared with the normal seasonal-flu vaccine," he adds. Although Kekulé calls the government's handling of the vaccination program a "scandal," he says government officials and soldiers are not necessarily getting a better deal with Celvapan. "Neither Celvapan nor Pandemrix are ideal," he says.

At least 26,000 people have been infected with swine flu in Germany, resulting in three deaths. Although the majority of patients have experienced only mild flulike symptoms, a steady increase in the number of cases of H1N1 in recent months has raised alarm across the nation. In its latest report, the Robert Koch Institute, the federal agency for infectious diseases, said new cases in Germany

have jumped to about 1,600 each week, double the 700 to 800 weekly cases reported in early autumn. With the onset of winter, when seasonal-flu infections typically peak, many experts are concerned that H1N1 infections will spike dramatically. Klaus Osterrieder, a virologist at the Free University of Berlin, now fears that with the worries over the possible risks associated with Pandemrix, many people will avoid getting a vaccine altogether. According to a survey conducted on Oct. 23 by the Emnid Institute, only 13% of Germans said they wanted to receive a swine-flu vaccine this winter.

"The public debate is bad because it raises questions about the whole vaccination program," Osterrieder says. If the government doesn't find some way to remedy the current public relations disaster and clear up the confusion over the different swine-flu vaccines, it could be faced with an even greater emergency, especially if the country's hospital wards start overflowing with flu patients in the coming months.

NEWS BBC

How not to run an immunisation campaign

BBC, Fergus Walsh, 27 October 2009, 15:20 UK time
https://www.bbc.co.uk/blogs/thereporters/ferguswalsh/2009/10/how_not_to_run_an_immunisation_campaign.html

Just days after the UK began vaccinating priority groups against H1N1 swine flu, Germany began its immunisation campaign.

Both countries have bought vaccines from the same two manufacturers, GSK (Pandemrix) and Baxter (Celvapan).

A man receives a vaccination against H1N1 swine flu in Berlin. But whereas the vaccination programme seemed to get off to a smooth start here, it was quite another matter in Germany.

The difference is that in Germany, ministers, government officials and the armed forces are getting Celvapan, while the general public will receive Pandemrix.

This has led to complaints of a two-tier health service, but a government spokesman said it was simply the results of different departments making their purchases without coordinating.

In the UK, *ministers are not eligible for swine flu jabs* unless they fall into one of the priority groups (and if they do they will get the same jab as the public).

Likewise 15,000 British troops in Afghanistan are to receive Pandemrix.

Indeed, there are so few doses available of the Baxter jab in the UK that it is being reserved largely for those with a severe egg allergy. Unlike the GSK jab, it is not grown in eggs.

The German Chancellor Angela Merkel has made it clear that if she is advised to be immunised by her doctor, then she will get the Pandemrix vaccine, intended for the general public.

The BBC's Tristana Moore filed a report from Berlin on the row which you can watch here.

Much of the debate in Germany centred on the fact that Pandemrix contains an adjuvant, a booster chemical, called AS303 which I wrote about in my last post.

GSK has just released new data on Pandemrix and forecast that by the end of this week nearly 500,000 people across Europe will have been immunised with the vaccine.

It also published results from a small trial in Belgium suggesting that the vaccine is effective in the elderly as well as younger age groups.

This is important because some studies of seasonal flu vaccines have shown that they are less effective in older age groups.

The row in Germany is a reminder of how easy it is to undermine public confidence in healthcare.

Ministers and officials need to ask themselves, "what might people think?" with any decision they make.

Whilst it may have been a perfectly innocent purchasing decision that led to ministers and the armed forces being allocated a different vaccine to the general public, it doesn't look good. Forget the fact that both vaccines have been licensed by the European Medicines Agency.

However efficiently Germany conducts its H1N1 swine flu programme in the coming months, damage has been done and it will undoubtedly put some people off having the jab.

THE FLU CASE

Alert Canadian
Toxic Ingredients in the Arepanrix H1N1 Vaccine Harm Your Health

The Flu Case, 27 October 2009, 18:12
https://web.archive.org/web/20091031083251/http://www.theflucase.com/index.php?option=com_content&view=article&id=1419:alert-canadians-toxic-ingredients-in-the-arepanrix-h1n1-vaccine-harm-your-health&catid=41:highlighted-news&Itemid=105&lang=en

Health Canada has authorized the sale of Arepanrix™ H1N1 vaccine based on no conclusive clinical testing. The authorization is based on the Health Canada review of available data on the quality, safety and immunogenicity of similar vaccines, which established the benefit/risk profile in favour of inoculating the Canadian population.

Read the Notice of Decision issued by Health Canada. The decision by the Health Minister was based on a belief (not qualified or informed) that immediate action is required to deal with the H1N1 risk. The assertion that the decision is based on limited clinical testing is being misapplied. There has been NO conclusive results from any clinical trials on the Arepanrix H1N1 vaccine.

This report is designed to inform you how the risks outweigh the benefits of the vaccine. It will demonstrate how the Health Canada assessment is flawed and contradictory to established research on the detrimental health effects of the vaccine ingredients contained in Arepanrix.

Description and Composition

Arepanrix™ H1N1 (AS03-adjuvanted H1N1 pandemic influenza vaccine) is a two-component vaccine consisting of an H1N1 antigen (as a suspension), and an AS03 adjuvant (as an oil-in-water emulsion).

The virus is inactivated followed by formaldehyde treatment and disrupted with sodium deoxycholate.

Preservative content:

5µg (micrograms) Thimerosal USP per 0.5mL dose or 2.5 micrograms organic mercury (Hg) per 0.5mL dose

Adjuvant:

The AS03 adjuvant system is composed of DL-α-tocopherol, squalene and polysorbate 80 in a 3mL vial:

DL-α-tocopherol: 11.86 milligrams/0.5mL dose
Squalene: 10.69 milligrams/0.5mL dose,
Polysorbate 80: 4.86 milligrams/0.5mL dose

Analysis of Ingredients

Formaldehyde

According to the Australian National Research Council, fewer than 20% but perhaps more than 10% of the general population may be susceptible to formaldehyde and may react acutely at any exposure level.

More hazardous than most chemicals in 5 out of 12 ranking systems, on at least 8 federal regulatory lists, it is ranked as one of the most hazardous compounds (worst 10%) to ecosystems and human health (Environmental Defense Fund).

Formalyn a 37 percent solution of gaseous formaldehyde which includes methano (used in vaccines as a tissue fixative) is considered a hazardous compound, and its vapor is toxic.

In the body, formaldehyde can cause proteins to irreversibly bind to DNA. Laboratory animals exposed to doses of inhaled formaldehyde over their lifetimes have developed more cancers of the nose and throat than are usual, as have workers in particle-board sawmills… Formaldehyde is classifed as a probable human carcinogen by the U.S. Environmental Protection Agency and as a known human carcinogen by the International Agency for Research on Cancer.

Sodium Deoxycholate

Sodium Deoxycholate is a water soluble ionic detergent/bile salt which causes cell death and symptoms such as burning, redness, and swelling. It has been shown to weaken the blood-brain-barrier (BBB) and subsequently activate seizures. It has demonstrated synergistic toxicity with antifungal drugs.

Detergents and emulsifiers promote tumors and cause cells to leak or explode by weakening their walls, with no mechanism for regulating destructive activity. These chemicals are not completely purified out of the final vaccine product, so they enter the body at the time of injection.

Detergents are used extensively in cell research precisely because of their ability to break cells open for further analysis. This catastrophically mimics the membrane attack complex (MAC). Detergents hit cells at random and continue destroying cells regardless of which call off the attack.

Sodium Deoxycholate is completely foreign to the relationships that define and make up the delicate balance of the immune system. It systematically disrupts these relationships to negate the optimal function and design of immune responses.

Thimerosal

Thimerosal has powerful and damaging effects on cells of the nervous and immune systems in mammals including humans. Its effect may vary depending on the dose, the genetics of the individual, and the timing of exposure. The mercury dose from thimerosal produces acute and often deadly ethylmercury blood levels.

Organic forms of mercury are well-known neurotoxic agents and far more dangerous than inorganic mercury sources. Exposure to organic mercury produces predominantly central nervous system (CNS) effects that are commonly severe and can induce prolonged unconsciousness, coma and death. (See: Acta Chim. Slov. 2004, 51, 361-372)

After only 2 hour exposures, thimerosal at micromolar concentrations causes neuronal membrane damage and alterations leading to cell death in immune T-cells.

Thimerosal alters the functioning of critical neurotransmitters necessary for proper brain functioning.

Thimerosal causes DNA fragmentation of neuronal cells and disrupts neuronal growth factor signaling at micromolar and even nanomolar concentrations. It also causes DNA methylation and attentional pathways at nanomolar concentrations, leading to alterations in brain function.

Under microscopic magnification the following video presentation by the University of Calgary demonstrates the immediate damage mercury does to the structure of brain cells.

Squalene in AS03 adjuvant

Too dangerous for human use, Squalene is not officially licensed for use in the United States or Canada. Oil adjuvants like squalene have been ordinarily used to inflict diseases in animals – for experimentation and study. According to anthrax vaccine expert Gary Matsumoto and other reliable sources, the US military used an unlicensed, experimental anthrax vaccination laced with squalene, with disastrous consequences, including Gulf War Sydrome.

"There are now data in more than two dozen peer-reviewed scientific papers, from ten different laboratories in the US, Europe, Asia and Australia, documenting that squalene-based adjuvants can induce autoimmune diseases in animals, observed in mice, rats, guinea pigs and rabbits. Sweden's Karolinska Institute has demonstrated that squalene alone can induce the animal version of rheumatoid arthritis. The Polish Academy of Sciences has shown that in animals, squalene alone can produce

catastrophic injury to the nervous system and the brain. The University of Florida Medical School has shown that in animals, squalene alone can induce production of antibodies specifically associated with systemic lupus erythematosus" writes Matsumoto.

Oil-based vaccination adjuvants like squalene have been proved to generate concentrated, unremitting immune responses over long periods of time according to a 2000 article in The American Journal of Pathology. The study demonstrated that a single injection of the adjuvant squalene into rats triggered a chronic, immune-mediated joint-specific inflammation, also known as rheumatoid arthritis. The researchers concluded the study raised questions about the role of adjuvants in chronic inflammatory diseases.

Polysorbate 80

Polysorbate 80 is similar to Sodium Deoxycholate in its ability to increase cell permeability, damage, and bursting. After injection it can rapidly metabolize into sorbitol and ethylene oxide which is much more toxic than the original chemical. When Polysorbate 80 breaks down there are 20 moles of ethylene oxide for every mole of sorbitol. These polysorbates have been shown to cause dangerous, sometimes fatal effects, when given through a needle. Changes in heart function can occur immediately. The blood-brain-barrier (BBB) can be weakened and penetrated, followed by seizures and even death. Polysorbates demonstrate synergistic toxicity with a wide range of chemicals.

Polysorbate 80 has been found to negatively affect the immune system and cause severe anaphylactic shock which can kill. According to Annals of Allergy, Asthma and Immunology, Volume 95, Number 6, December 2005 , pp. 593-599(7), "it is of current relevance as a 'hidden' inductor of anaphylactoid reactions", and "Polysorbate 80 was identified as the causative agent for the anaphylactoid reaction of nonimmunologic origin in the patient. The study included a pregnant woman who suffered anaphylactic shock after being given a IV drip of multi-vitamins containing polysorbate 80.

In addition to this, there have been studies in Food and Chemical Toxicology which showed that Polysorbate 80 causes infertility. Baby female rats were injected with polysorbate 80 at days 4-7 after birth. It accelerated the maturing of the rats and caused changes to the vagina and womb lining, hormonal changes, ovary deformities and degenerative follicles.

According to the World Intellectual Property Organization, which is part of the United Nations, scientists from the organization are developing vaccines specifically to damage fertility as a method of contraception. A suggested ingredient for the vaccine is Polysorbate 80 (also known as tween 80). As it is a preferred ingredient, scientists are obviously aware of its ability to cause infertility.

Discussion

There are currently NO clinical trials or results which have validated the long-term safety and efficacy of the Arepanrix H1N1vaccine and its integrated AS03 adjuvant. Regulatory health agencies are refusing to acknowledge this fact or the nature of toxicity levels associated with Arepanrix and its ingredients. The well documented toxicity evidence for each ingredient presented above is simply being ignored.

A simple search on the ClinicalTrials.gov website shows that three "Rapid Evaluation" studies for Arepanrix H1N1vaccine have not even initiated recruiting as of the date this article was published.

H1N1 vaccine makers struggle with U.S. shot

NBC News, 27 October 2009 // 28 October 2009, 2:49 am + 08
https://www.nbcnews.com/id/wbna33494844

GlaxoSmithKline has yet to get U.S. government approval for its swine flu vaccine, the company said on Tuesday, while

Novartis said it was still struggling to make vaccines.

A U.S. senator accused the Health and Human Services department of over-promising how many and how quickly H1N1 vaccines could be delivered, as disgruntled people lined up outside clinics across the United States seeking immunization.

The United States has contracted with its five suppliers of seasonal influenza vaccine to also deliver H1N1 vaccine, but has sharply cut initial estimates of how much will be delivered this month and next. HHS says companies are having more trouble than anticipated making the vaccine, which is grown in chicken eggs using 50-year-old technology.

Glaxo, which signed a broad agreement earlier this year with HHS for $250 million of pandemic products including vaccines, says its vaccine has yet to be approved by FDA, although it submitted it in September. – "We are working with the HHS to determine how we can best meet their needs and final shipping dates will not be known until these discussions and the regulatory approval process have been completed," said Glaxo spokeswoman Claire Brough.

Australian vaccine maker CSL said the FDA had released five lots of its vaccine. "In terms of H1N1 vaccine production, CSL is working as quickly and efficiently as possible to manufacture H1N1 vaccine antigen and is making good progress," a spokeswoman said in an e-mail.

Part of the problem is the "seed" strain – the virus sample sent to companies to make vaccine with – did not grow particularly well in eggs. – "The company is using a new H1N1 virus seed strain which is providing better yields than the original seed strain that all manufacturers were given back in May. This is helping CSL produce more vaccine antigen more quickly than before," the spokeswoman said. She said a new U.S. facility in Illinois got FDA approval in September and was now packaging vaccines.

Novartis was also struggling. – "Yes the yields are lower than initially expected, with delays to the volume available," said spokesman Eric Althoff, adding that the Swiss group had informed the U.S. government about the lower yields through the whole process.

Only half expected doses distributed

HHS initially predicted it would have distributed 40 million doses of vaccine by the end of October, but only 22 million have been parceled out.

AstraZeneca's MedImmune unit has had no trouble producing nasal spray vaccine, which was the first available to the U.S, market, while Sanofi-Aventis said on Friday it was on track to deliver more than 75 million doses.

Maine Republican Susan Collins asked why the estimates were so far off. – "I am troubled that HHS has assured the public since August that the government would have enough vaccine to meet demand," she said in a letter to Health and Human Services Secretary Kathleen Sebelius, released late on Monday. "It now appears that much of the vaccine could arrive only after many people have already been infected with H1N1."

Collins cited a Purdue University study that predicted that nearly 60 percent of the American population would be infected with H1N1, of whom a third would fall ill, and that last week would see the peak of infections.

"It seems that HHS gave its assurance of sufficient supply in August without adequate information to make such a commitment," she said.

An HHS spokesman had no immediate comment

Flu vaccine may come too late

The Globe and Mail, 27 October 2009
https://www.theglobeandmail.com/opinion/flu-vaccine-may-come-too-late/article4291125/

Should you be immunized against the H1N1 influenza? That depends on who you are, where you live and when you ask. Notwithstanding the increasingly hard sell from some public-health authorities, the truth is that the vaccine will be too late to be of real value for many Canadians.

H1N1 is already active in many parts of Canada. It's an early flu season, but a relatively mild one. "Mild" still means that more than a million Canadians will get a little sick and a small number will get very ill. But this is no more than we expect every year from influenza.

We had the measure of H1N1 even before we had a vaccine. Our health-care system will not be overwhelmed. Commerce will not grind to a halt. Women are no more vulnerable than men. Mortality rates are highest in people of middle age or older.

Two-thirds of severe illness and death will be in people with serious underlying medical problems.

Healthy people have little to fear from H1N1. The virus itself has not changed. About one in 20 will develop an unpleasant but short-lived "flu." Their chances of dying from H1N1 are about 1 in 250,000. The same healthy person is about 20 times more likely to die this year from a motor-vehicle crash.

Over the next few weeks, we will see a few more deaths in otherwise healthy young people – because more people are getting infected than in a usual flu season. Unfortunately, these individual tragedies will be blown out of proportion by the media.

In addition to people with underlying medical problems, H1N1 tends to be more severe in pregnant women and in children under the age of 5. Babies under six months of age are also vulnerable but cannot be immunized. (People living with a young baby should be immunized to avoid bringing the virus home.)

The Canadian government is boasting that there is enough vaccine for everyone. This is a tad disingenuous. The vaccine is arriving in weekly aliquots of two million to three million doses. We don't actually have enough vaccine to immunize everyone right now. And, as it turns out, timing is a crucial issue for many Canadians.

Local flu outbreaks typically peak within four or five weeks and then drop off rapidly. The vaccine takes time – probably a week – to provide protection after it is given. When H1N1 is gone, it's almost certainly gone for this flu season.

The worst of H1N1 will have passed from some areas of Canada - Southern Ontario and the lower mainland of British Columbia, at least - before healthy people can even roll up their sleeves.

The new adjuvanted influenza vaccine is safe and effective. The risk of a significant reaction is extremely small. But we don't immunize people just because we can. We're supposed to base our recommendations on expectations of benefit.

Quite appropriately, public-health authorities are giving priority to immunizing the most vulnerable. They should get immunized as quickly as possible. Two-thirds of all immunization benefits will come from protecting these small groups. Everyone else should wait. It's far too late to apprehend the outbreak anyway.

So what about the healthy general public?

If the vaccine becomes available to you before H1N1 hits your part of the country, then it's entirely reasonable to be immunized. It's also reasonable to take a pass. The anticipated benefits from immunization are very small, and the risks are tiny. But if H1N1 has already peaked in your community, these benefits drop off dramatically. It's too late.

But there is a place where our surplus Canadian vaccine - all 30 million doses or so - can do some real good. Send it to developing countries that will soon face a second wave of H1N1 without a vaccine, antiviral drugs or intensive-care units to assist their most vulnerable.

There's still time to do that.

CTV NEWS

Rush for vaccine puts high-risk groups at risk: experts

CTV News, 28 October 2009, 7:19 PM EDT
https://www.ctvnews.ca/rush-for-vaccine-puts-high-risk-groups-at-risk-experts-1.448144?cache=wcoseppn%3FclipId%3D89925

Some flu experts are warning that with long lineups at flu vaccination clinics, those who need the vaccine the most are at risk of not getting it.

Across the country, vaccine clinics have been overwhelmed, with some patients being turned away because supplies have temporarily run out, and others reporting waits of more than two hours.

Many are complaining that those who need the vaccine the most – pregnant women, children under five years of age and those with chronic illnesses – are not being given first priority for the shots.

Health officials have said that anyone who want the vaccine can receive it, so clinics are not "triaging" patients to allow high-risk groups to get it first. Instead, officials are relying on the honour system, asking healthy, low-risk group to stay away from the clinics until those who need the vaccine the most can get it.

In an editorial in today's *Globe and Mail*, infectious disease experts Drs. Richard Schabas and Neil Rau say that while the federal government is boasting that there is enough vaccine for everyone, "this is a tad disingenuous."

"The vaccine is arriving in weekly aliquots of two million to three million doses. We don't actually have enough vaccine to immunize everyone right now," they write.

And, they note, timing is of the essence for those most at risk of serious complications of swine flu.

Local flu outbreaks typically peak within four or five weeks and then drop off rapidly. And in some areas of the country, outbreaks might already be beginning to peak.

"The worst of H1N1 will have passed from some areas of Canada – Southern Ontario and the lower mainland of British Columbia, at least – before healthy people can even roll up their sleeves," they write.

The fact that the vaccine takes about 10 days to fully protect from infection will extend the lag time even further, says Rau. In comments made to CTV's Canada AM Wednesday, he said the most vulnerable will probably be okay if they can get the vaccine within the next week. But two weeks from now may be too late for them.

"If we start to target the entire population with the vaccination campaign, we will not be able to get to everyone," he said.

The high demand for the vaccine has caught many health officials off-guard, and comes in spite of a recent Strategic Counsel poll that found that only half of Canadians wanted the vaccine. That survey, for CTV and *The Globe and Mail*, suggested 51 per cent of Canadians did not plan on getting immunized.

But the sudden death this week of an otherwise healthy boy in southern Ontario, along with other deaths in Ontario and Saskatchewan has made many parents worried, with some telling CTV News that their ambivalence to the vaccine was erased when they heard about those deaths.

The deaths have also been followed by a sudden a stampede to children's hospitals, some are reporting.

The emergency room at Toronto's Hospital for Sick Children has seen a big surge in patients. While the hospital's Dr. Anne Matlow wouldn't provide an exact figure, she says the volume of cases is similar to what they see during peak flu season – which usually comes much later in the year.

And the Children's Hospital of Eastern Ontario says it saw a 49 per cent jump in emergency room visits over the last week, with a 100 per cent rise in visits Monday alone.

Matlow says many of the patients coming to the ER with respiratory illness have H1N1 but most of the cases are mild and most children are being sent home.

Rau noted that while the recent deaths are tragic, they weren't unexpected and are not a reflection of a sudden increase in virulence of H1N1. – "It would seem that this flu is attacking young healthy people. But the truth is this is the medical equivalent of being struck by lightning. This is still an incredibly rare event," Rau insisted.

He says the death should remind people in high-priority groups to get the vaccine as quickly as they can, but it shouldn't worry otherwise healthy people that the virus is going to kill them as well.

As for the sudden interest in the vaccine, he encourages those who are most at risk to get the vaccine but he also reminds that all of the southern hemisphere braved swine flu this past summer, with low rates of death. – "Australia faced their entire outbreak, full-blast, without a vaccine in hand," he noted.

Advice to travellers

Meanwhile. federal health officials are advising that people feeling ill with flu should postpone travel plans.

In a news conference Wednesday, Dr. David Butler-Jones, the chief public officer of health advised that if people are ill and can't avoid travel, they should consider driving to their destination rather than risk the health of others on public transit.

Health Minister Leona Aglukkaq added the government is encouraging travel companies to make it easier for people to re-book flights and buses if they have to cancel because of sickness.

Her officials are also sending guidelines to travel companies to help them cope with the H1N1 virus. These guidelines suggest regular cleaning of public areas in stations and vehicles and say companies should provide hand-washing facilities for passengers and crews.

Swine flu vaccine expected to boost GSK

The Guardian, 28 October 2009, 18.02 GMT
https://www.theguardian.com/business/2009/oct/28/swine-flu-vaccine-boosts-glaxosmithkline

GlaxoSmithKline forecasts that sales of swine flu vaccine Pandemrix will hit £1bn in fourth quarter of the year.

Swine flu vaccines are set to provide a sharp boost to GlaxoSmithKline's sales, the pharmaceuticals giant said today.

GSK, which has already sold 440m doses of its swine flu vaccine Pandemrix worldwide, said that sales would hit £1bn this quarter.

The company said today that third-quarter revenues rose 15% while earnings per share were up 13%, just below forecasts, but the results do not yet include figures for its Pandemrix vaccination for the H1N1 virus. Sales were boosted by flu drug Relenza, which made up for losses to generic competition in other products.

GSK confirmed in July that the vaccination would cost developed countries around €7 for each dose, but has declined to reveal production costs amid speculation that Pandemrix costs as little as £1 a dose to make.

Andrew Witty, GSK's chief executive, said: "In Europe, we received approval for Pandemrix, our pandemic H1N1 vaccine. This follows more than 10 years of investment and effort into research of pandemic influenza. To date we have announced orders worldwide for approximately 440 m doses of the vaccine."

Fears are growing of a winter surge in the pandemic after the estimated number of new cases of swine flu in the UK almost doubled last week to 53,000, bringing the total number of cases to 435,000. Deaths of people in the UK suffering from swine flu rose to 128, with 93 deaths in England, 21 in Scotland, eight in Northern Ireland and six in Wales.

President Obama declared a national emergency in the US earlier this week as swine flu deaths soared to 1,000. Government officials in the US have been offering free vaccines against swine flu, delivering millions of doses to concerned citizens.

Swine flu peaks out before vaccines even make it into widespread distribution

Natural News, 28 October 2009
https://www.naturalnews.com/027347_flu_vaccine_vaccines.html

Swine flu infections have peaked out in the USA, even before drug companies could get their vaccines injected into everyone. According to CDC findings announced recently in Atlanta, one in five U.S. children have already experienced the flu this month, and most of those were likely H1N1 swine flu cases, the CDC says.

This comes from a survey of over 10,000 U.S. households conducted by the CDC.

Meanwhile, flu vaccine shipments are way behind schedule. There have been supply problems from the start, and as of right now, relatively few Americans have yet been injected with the swine flu vaccine. (Many have stood in line for hours trying to be injected, but were told to go home with the vaccine ran out.)

Out of nearly 14,000 suspected flu cases tested during the week ending on October 10, 2009, 99.6% of those were influenza A, and the vast majority of those were H1N1 swine flu infections. (http://www.cdc.gov/flu/weekly/) This is a very strong indication that swine flu infections have peaked during October, 2009.

Further supporting that notion, researchers from Purdue University just published a paper in the October 15 issue of Eurosurveillance (a science journal about communicable disease) in which researchers stated that the H1N1 swine flu epidemic would peak during "week 42" (the end of October). Week 42 just passed. It's over.

The AJC is also reporting this week that swine flu is "retreating" in Georgia, where hospital visits from the flu are markedly down and fewer illnesses are being reported in schools, too.
=> https://web.archive.org/web/20091029100925/http://www.ajc.com/health/swine-flu-levels-off-174477.html

Even the WHO is reporting a downward trend in many areas, saying, "In tropical areas of the world, rates of illness are generally declining, with a few exceptions. ...In tropical Asia, of the countries that are reporting this week, all report decreases in respiratory disease activity."
=> https://web.archive.org/web/20091025124124/http://www.who.int/csr/don/2009_10_23/en/index.html

Meanwhile, even as the swine flu infection peaks out, the shortage of swine flu vaccines means few people have yet been vaccinated. The shortage is causing "chaos" in clinics across the country, news reports say, and flu vaccination events have been cancelled due to the non-arrival of expected vaccines.

And what, exactly, is causing this shortage of vaccines? According to Health and Human Services Secretary Kathleen Sebelius, they're being caused by "production failures" at the drug manufacturing facilities.

Too little, too late

Is she serious? People are lining up to be injected with chemicals made by companies that are suffering "production failures?" If these companies can't meet the production targets they already promised, how can we expect them to meet the safety targets they promised?

The bigger point, though, is that by the time vaccines are available for everyone, most people will have already been exposed to the H1N1 virus and therefore won't even need a vaccine. There's also evidence that previous exposure to seasonal flu may confer some natural immunity to H1N1, meaning that vaccines may be redundant from the start. =>
https://web.archive.org/web/20091030044528/https://www.naturalnews.com/027337_H1N1_viruses_natural_immunity.html

Delivering vaccines to the public after the pandemic peaks and wanes is sort of like putting on your seatbelt after a head-on collision. (This metaphor assumes, just for the moment, that swine flu vaccines actually work. Even though they don't.)

Through the coming holiday season, we'll all get to watch the CDC, the FDA and drug companies desperately try to push vaccines onto people, most of whom are already immune to H1N1 because they were exposed during the peak of the pandemic. This will be quite entertaining to observe because you'll get to watch health authorities in action, attempting to fabricate an emergency when the pandemic threat has already faded. To maximize vaccinations (and therefore Big Pharma revenues), they'll need to keep pushing the pandemic fears through the winter months while hoping that no one notices the H1N1 pandemic has evaporated.

Predictably, the big push at that point will be based on the following logic: "Even if you were already exposed to H1N1, getting a vaccine shot can't hurt. Might as well get one!"

The CDC, which once promised 150 million vaccines by mid-October has pushed its prediction to year's end. Unless some new H1N1 mutation is released into the population by some bioterrorist group, it's fairly obvious that the swine flu will have fizzled out by the time Christmas rolls around.

How to dispose of a hundred million doses of a useless vaccine...

So what will all these clinics do with all the millions of doses of vaccines that nobody really needs at that point? It might seem prudent to dump them down the river, except for the fact that their chemical additives and preservatives make many vaccines qualify as "hazardous waste" according to EPA regulations. It's illegal to toss them into rivers or even dump them down the drain... it's perfectly legal, though, to inject them into the body of a six-year-old.

Why don't they just save the vaccines for next year? They'll be useless, of course, but no more useless than they already are this year. Just save up all the vials and unleash another swine flu scare next fall to get rid of the inventory! (Don't laugh. These people might actually take the idea seriously)

You gotta love the pharmaceutical industry. After forty years of research into cancer (and tens of billions of dollars spent on it), they have yet to find a cure for any cancer at all. And with the swine flu fiasco, they almost managed to come up with a vaccine, but the human immune system – combined with a nation full of sneezers and spreaders – beat them to it.

It must really be depressing to wake up one day as a pharmaceutical company executive and realize you're irrelevant... and that your "lifesaving" products are obsolete before they even hit the streets. Of course, the ridiculously high pay might make up for some of that, and if you get really depressed, you can always take your own company's pills if you're willing to brave the suicide risk. But in the end, the simple fact is that human beings would be better off of the drug companies didn't exist.

The fact that H1N1 swine flu has already peaked out before the bulk of the vaccine shipments have even arrived proves, once again, how utterly pathetic and medically useless flu vaccines are in the first place. There is nothing a flu vaccine can do that simple vitamin D can't do better, and the sad truth is that the entire flu vaccine industry is built on medical quackery and marketing propaganda.

NZZ Online

Verspätete H1N1-Impfaktion:
Grossflächige Impfung auf Anfang Dezember verschoben

Neue Zürcher Zeitung, 28 Oktober 2009
https://web.archive.org/web/20091031110210/http://www.nzz.ch/nachrichten/schweiz/verspaetete_h1n1-impfaktion_1.3933952.html

In einigen Ländern hat die Impfaktion gegen die Schweinegrippe bereits begonnen. Warum es in der Schweiz zu einer Verzögerung kommt, ist nicht ganz klar.

Während in mehreren europäischen Ländern die Impfaktionen gegen die Schweinegrippe bereits angelaufen sind, etwa in Deutschland, Österreich, Frankreich und Grossbritannien, wartet die Schweiz immer noch auf eine Zulassung der bestellten Impfstoffe. Am Dienstag berichtete «20 Minuten» von einem Brief des VBS an Dienstpflichtige, die zu einer Impfaktion einrücken sollten. Die Aktion werde auf Anfang Dezember verschoben, angeblich, weil der Hersteller nicht wie geplant Mitte Oktober, sondern erst Anfang Dezember liefern könne.

Das BAG schweigt sich aus

Diese Information stimme nicht ganz, sagt der Pressesprecher des Bundesamts für Gesundheit (BAG), Jean-Louis Zürcher. Es liege nicht daran, dass die Hersteller nicht liefern könnten. Man habe immer kommuniziert, dass die Impfstoffdosen gestaffelt eintreffen würden. So könnten die Risikogruppen auch schon früher geimpft werden – der Grossteil der Bevölkerung wahrscheinlich aber erst Anfang Dezember, mehr wolle er dazu jetzt nicht sagen. Am kommenden Freitag will das BAG informieren, wann, wer und mit welchem Impfstoff geimpft werden soll.

Geringer Zeitdruck

Warum sich die Impfaktion verzögert, ist nicht ganz klar. Die europäische Zulassungsbehörde hat einen der Impfstoffe, von dem die Schweiz acht Millionen Dosen bestellt hat, bereits Ende September zugelassen. Dabei handelt es sich um «Pandemrix» von der Firma GlaxoSmithKline. Seitdem wartet man in der Schweiz auf eine Zulassung durch das Heilmittelinstitut Swissmedic. Diese wird nun auf Ende Woche erwartet. Dass sich die Behörde mit dem Prozedere so viel Zeit liess, liegt womöglich daran, dass die Pandemie weniger schlimm ist, als man ursprünglich gedacht hatte, und eine sorgfältige Überprüfung der Impfrisiken deshalb sinnvoll erschien.

Offen ist allerdings, warum es danach so lange dauern soll, bis genügend Impfstoff für die breite Bevölkerung geliefert werden kann. An Lieferengpässen soll es laut einem Pressesprecher von GlaxoSmithKline nicht liegen. Mehr dürfe er dazu aber nicht sagen. Auch das BAG wollte dazu keine Auskunft geben und verwies auf die Pressekonferenz vom kommenden Freitag.

Switzerland to delay start of the "swine flu" vaccination campaign until December

The Flu Case, 29 October 2009
https://web.archive.org/web/20100205022558/http://theflucase.com/index.php?option=com_content&view=article&id=1451%3Aswitzerland-to-delay-start-of-the-qswine-fluq-vaccination-campaign-until-december&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Swiss authorities have postponed the start of its mass swine flu vaccination campaign until the beginning of December reports the Neue Zürcher Zeitung.

The newspaper reports that some authorities are sending out letters to staff telling them that the vaccine campaign has been delayed until December because pharma companies cannot deliver enough vaccines.

The report comes at a time of growing concern over the safety of GlaxoSmithKline's Pandemrix swine flu jab and Novartis's Celtura jab, which was unexpectedly not given market approval by the Swiss drug regulator Swissmedic last week over safety data and contamination worries.

A Swiss Health Ministry spokesperon Jean-Louis Zürcher, however, told the NZZ that the information about the postponement of the swine flu campaign "was not quite true" and that pharma companies had plenty of vaccine, fuelling the impression that there are growing divisions over the need and timing of mass "swine flu" jab campaign within Switzerland.

State faces swine flu pandemic, warns FG

The Flu Case, 29 October 2009
https://web.archive.org/web/20100205022419/http://theflucase.com/index.php?option=com_content&view=article&id=1437%3Airish-qswine-fluq-vaccination-campaign-qshambles-a-mess-falling-apartq&catid=41%3Ahighlighted-news&Itemid=105&lang=en

SEANAD Report: The State faces a potential swine flu pandemic, Liam Twomey (FG) warned. Anyone who did only a small amount of research would realise that the HSE's campaign in regard to the swine flu vaccination programme was an absolute shambles and was falling apart.

There were not l,800 doctors participating in the scheme. The HSE had been sending vaccine doses to general practitioners' surgeries, but no documentation whatsoever had been sent.

There was a serious need for the Minister for Health to actually say that she was responsible for something and she should look into what was going on "with this potential pandemic in our healthcare system. Because at this moment in time my gut instinct is that it is a mess."

Lisa McDonald (FF) said there was an urgent need for clarification on the availability of the vaccine for pregnant women. She had been contacted by a woman who lived next door to someone who had been stricken by the virus.

This woman, who was 32 weeks pregnant, had been told by her GP that he would not be providing the "vaccination". It was a disgrace that they were allowing vulnerable people to endure worry because of a lack of clarification which could, in her view, be provided quickly.

A Fine Gael move to have an emergency debate on how the December 9th budget should be framed, was defeated by a single vote – 25 to 24.

Dan Boyle (Green Party), deputy Government leader in the House, said he did not think any Senator should second guess what was likely to happen on December 9th. The Government was committed to a budget adjustment of €4 billion.

The circumstances demanded that such an adjustment be made, but how this was to be done had yet to be decided, added Mr Boyle.

Will Fed. Government’s Proposed Mandatory Health Insurance Work?

Your Online Insurance, 29 October 2009
https://web.archive.org/web/20091106104458/http://www.youronlineinsurance.com/health-insurance/will-fed-governments-proposed-mandatory-health-insurance-work-141/

Understanding Health Reform

The Governments proposed mandatory health insurance has been the headline of most news media and on most Americans minds these past months. But, there have been many reports, studies and surveys that show Americans will most likely not comply with the mandate of health insurance as reported by the Insurance Research Council.

Most Americans are concerned about how the government office will enforce such a mandate as regulation is only as good as enforcement. Also reported in the recent studies of the Insurance Research Council is that some people are simply irresponsible and look to others to buy their insurance.

With the government proposed order of making it mandatory for all Americans to have health insurance, many wonder about the affordability for the insurance. As the nations unemployment rate rises, more and more people will drop those expenses necessary to make ends meet.

However, under the proposed health reform, those Americans who refuse to purchase health insurance could face monetary penalties. The fines speculated in the health reform bill currently being reviewed by Congress could reach $1,000 for offenders. The Congressional Budget Office has reported that these fines to offenders caught without health insurance could raise billions in dollars over a ten-year period.

What Will Be Considered Mandatory

The Federal Governments proposed *mandatory health insurance will mean mandatory vaccinations/immunizations*. The Center for Disease Control (CDC) says that for anyone who refuses to keep up-to-date vaccinations, under the new health reform, you will not be able to obtain any health care you may need until immunizations are current.

WHO experts say flu vaccines safe, one dose needed

Reuters, 30 October 2009, 9:49 PM GMT+8U
https://www.reuters.com/article/idUSTRE59T2D1/

Geneva (Reuters) **-** Only one dose of vaccine is needed for protection against pandemic H1N1 flu and the jabs have so far proved to be safe, the World Health Organisation said on Friday.

Health experts have been debating whether one or two shots are necessary to protect against H1N1, known as swine flu. The number of doses required is key to estimating how many vaccines are needed in total.

The WHO has repeatedly sought to reassure people around the world that the H1N1 vaccines being made by 25 different companies, with various formulations, are safe.

"All the reports received to date following vaccination – either in clinical trials or in mass vaccination campaigns – have hown that the safety profile of these pandemic vaccines is good and is very similar to the one which is known for seasonal influenza vaccine," said WHO expert Marie-Paule Kieny.

"Nothing special in terms of adverse events has been noted," Kieny, who heads the U.N. health agency's vaccine research, told journalists on a telephone conference.

Safe, Single Dose

Earlier this week, its Strategic Advisory Group of Experts on Immunisation (SAGE) examined vaccines for H1N1, which tends to affect teenagers and young adults most.

A statement from the Geneva-based WHO said the SAGE experts had found no signs of unusual "adverse events" – the technical terms for severe complications such as illness or death – from pandemic vaccines.

As a result, they said pregnant women, who are particularly vulnerable to H1N1, should be given the pandemic vaccines.

At least 5,712 people have died from confirmed cases of H1N1, WHO said in an update.

The SAGE committee recommended that a single dose of H1N1 vaccine should be used for adults and adolescents from age 10.

It said more studies were needed on the effectiveness of vaccines in children aged up to 10 years. Where national health authorities have made children a priority for vaccination, they should aim to vaccinate as many children as possible with a single dose, the group concluded.

The recommendation corresponds to WHO's estimate earlier this month that one dose suffices. Last week Europe's drug watchdog said two doses would be preferable.

In its statement, the WHO said 1 to 10 percent of patients who developed a serious illness needed hospital treatment. Of those, 10 to 25 percent needed treatment in an intensive care unit and 2 to 9 percent died.

Very young children are most likely to require hospital treatment for the flu strain.

The WHO declared H1N1 an unstoppable global pandemic in June. Kieny said it could still make sense for countries to close schools, as Ukraine has done after its first confirmed swine flu death, to slow the spread of the virus.

In most cases, the WHO said is safe to administer vaccines for H1N1 and regular seasonal flu together, but not when both were "live attenuated" vaccines such as nasal sprays.

WHO guidance on H1N1 vaccination is seen as pivotal for the pharmaceutical industry's investment decisions as well as government policies on purchasing and distributing vaccines.

Earlier this week GlaxoSmithKline said it would get a boost from H1N1 vaccine sales this year.

And Sanofi-Aventis raised its outlook for 2009 saying the swine flu vaccine could add about $500 million (302 million pounds) to its sales in the fourth quarter.

Yearly influenza vaccinations: a double-edged sword?

Lancet Infect Dis. 30 October 2009 [Epub] Dec; 9 (12):784-8
doi: 10.1016/S1473-3099(09)70263-4
https://pubmed.ncbi.nlm.nih.gov/19879807/

Abstract
Yearly vaccination against seasonal influenza viruses is recommended for certain individuals at high risk of complications associated with influenza.

It has been recommended in some countries, including the USA, that all children aged 6-59 months are vaccinated against seasonal influenza.

However, it has been shown-mainly in animals-that infection with influenza A viruses can induce protective immunity to influenza A viruses of other unrelated subtypes. This so-called heterosubtypic immunity does not provide full protection, but can limit virus replication and reduce morbidity and mortality of the host.

This type of immunity might be relevant to human beings when a new subtype of influenza A virus is introduced into the population, such as the new influenza A H1N1 virus responsible for the present influenza pandemic and the highly pathogenic avian influenza H5N1 viruses that are causing an ever increasing number of human infections with high mortality rates.

Preventing infection with seasonal influenza viruses by vaccination might *prevent the induction of heterosubtypic immunity to pandemic strains*, which might be a disadvantage to immunologically naive people – e.g., infants.

H1N1: Bachelot sort les contrats des labos mais efface les prix

Rue89, 30 October 2009, 16H24
https://web.archive.org/web/20091101090325/http://www.rue89.com/2009/10/30/h1n1-bachelot-sort-les-contrats-des-labos-mais-efface-les-prix-124020

Le ministère de la Santé laisse filtrer les accords passés pour la fabrication de vaccins. Les sommes à payer ont été effacées.

Après avoir longtemps revendiqué le secret autour des contrats sur les 94 millions de doses de vaccins contre la grippe A/H1N1, le ministère de la Santé a fini par autoriser leur publication. Mais partielle, puisque les montants totaux et les montants des doses ont subi un coup de Tipp-Ex!

Ce jeudi, la commission d'accès aux documents administratifs, saisie par l'hebdomadaire Le Point, a demandé à l'établissement de préparation et de réponse aux urgences sanitaires (Eprus) , la grande pharmacie de l'Etat, signataire des marchés avec les laboratoires Baxter, GlaxoSmithKline, Novartis et Sanofi-Pasteur, de communiquer les contrats et leurs annexes.

Vingt-quatre heures après cette demande, le voile est levé : saisie par Rue89, l'Eprus nous a fourni les contrats accompagnés d'« éléments de contexte ».

Las, ces derniers, placés en tête du document, précisent qu'en vertu du « secret en matière commerciale et industrielle, notamment le secret des procédés », certaines mentions ont été effacées.

Roselyne Bachelot avait déjà révélé les prix des vaccins lors d'une audition devant les sénateurs. En les multipliant par le nombre de doses officiellement commandées on arrive à avoir une petit idée du montant des contrats.

- Sanofi-Pasteur : 175 millions d'euros (6,25 euros la dose)
- Novartis : 149,44 millions d'euros (9,34 euros la dose)
- GSK : 350 millions d'euros (7 euros la dose)
- Baxter : 500 000 euros (10 euros la dose)

Le total est de 674,9 millions d'euros hors taxes, ce qui fait 712 millions TTC. Un chiffre différent des 804 millions d'euros annoncés par la ministre, qui a eu la maladresse de « mal communiquer, en s'emmêlant les pinceaux sur la TVA, passée de 19,6 à 5,5% au moment de l'autorisation de mise sur le marché », remarque le député PS Gérard Bapt, rapporteur du budget de la sécurité sociale.

Une protection juridique en cas de recours

Pour Baxter, qui fournit les vaccins les plus chers, « aucun élément ne parait être communicable », indique l'Eprus.

On apprend aussi en lisant ces contrats que:

Les titulaires des marchés n'encourent aucune pénalité de retard lié à des rendements plus longs que prévus.

Pour Baxter, les paiements de l'Etat sont assez confortables puisque 20% du montant de la commande sont versés à la notification du contrat, 20% au démarrage de la première étude clinique, 40% au fur et à mesure des livraisons et 20% à l'obtention de l'autorisation de mise sur le marché (AMM) ou lors de l'utilisation des vaccins si celle-ci intervient avant l'AMM (ce qui veut dire que l'Etat imaginait pouvoir vacciner sans autorisation en bonne et due forme).

Pour le contrat avec GSK, ce dernier a exigé une « liste rouge » d'informations soumises à confidentialité, comme le prix par dose.

Dans les contrats avec Novartis et Sanofi Pasteur, une clause quasi léonine est ajoutée, qui protège juridiquement le laboratoire:
«A titre dérogatoire et considérant les circonstances exceptionnelles qui caractérisent le présent marché, l'Etat s'engage à garantir le titulaire [du contrat] contre les conséquences de toute réclamation ou action judiciaire qui pourraient être élevées à l'encontre de ce dernier dans le cadre des opérations de vaccination, sauf en cas de faute du titulaire ou sauf en cas de livraison d'un produit non conforme aux spécifications décrites dans l'autorisation de mise sur le marche.»

THE FLU CASE

French Health Ministry blanks out key figures from contract for swine flu jab

The Flu Case, 2 November 2009, 13:19
https://web.archive.org/web/20091109045241/http://www.theflucase.com/index.php?option=com_content&view=article&id=1556%3Afrench-health-ministry-blanks-out-key-figures-from-contract-for-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The contract that the French Health Minister Roselyne Bachelot sealed with pharmaceutical companies to supply the "swine flu" jab was made public last week following a freedom of information request - but with key figures blanked out by tipp ex on the grounds of the need to safeguard the commercial and industrial secrets of Novartis, Baxter, GlaxoSmithKline and Sanofi.

Bachelot, who worked for pharma companies for at least 12 years, has told parliament how much swine flu jabs will cost, allowing the following estimates to be made of how much companies will earn from the swine flu vaccination campaign:

- Sanofi-Pasteur: 175 million euros (6,25 euros per dose)
- Novartis: 149,44 million euros (9,34 euros per dose)
- GSK: 350 million euros (7 euros per dose)
- Baxter: 500 000 euros (10 euros per dose)

Schweinisch viele Milliarden

20 Minutes Channel, 30 October 2009, 16:09
https://web.archive.org/web/20091103164301/http://www.20min.ch/finance/news/story/17434137

Für Novartis läuft das Geschäft mit der Schweinegrippe optimal: Wegen der allgemeinen Pandemie-Panik sind die Auftragsbücher übervoll. Die Kassen klingeln: Die Staaten übernehmen die «Werbekosten» und Novartis macht den Reibach – mit einer Marge von bis zu 50 Prozent.

Beim Schweizer Pharmagiganten Novartis türmen sich die Bestellungen. Bisher orderten Regierungen aus aller Welt insgesamt über 200 Millionen Ampullen des Impfstoffes gegen die Schweinegrippe. 30 – 40 Millionen Dosen des H1N1–Impfstoffs gehen in die USA. Bei einem Preis zwischen 5 und 20 Dollar pro Impfstoff würde der Pharmakonzern bis zu 2 Milliarden Dollar umsetzten können. ZKB-Analyst Michael Nawrath hält einen solchen Umsatz aber für sehr unwahrscheinlich: «Es fehlen wie bei jedem Impfstoffhersteller die Kapazitäten. Novartis ist lediglich in der Lage zwischen 90 und 120 Millionen Einheiten zu produzieren». Rechne man nun mit einem realistischen Durchschnittspreis von 10 Dollar und 100 Millionen produzierten Einheiten, resultiere ein Umsatz von einer Milliarde Dollar. «Zugegeben, das ist eher konservativ gerechnet», sagt Nawrath. Wie Novartis bereits verkündet hat, werden sich die Schweinegrippe-Umsätze in den Bilanzen des vierten Quartals 2009 und des ersten Quartals 2010 niederschlagen. Nawrath schätzt, dass dieses Jahr etwa 600+ Millionen und nächstes Jahr rund 400+ Millionen Dollar verbucht werden.

Der Basler Pharmakonzern produziert zwei Impfstoffe gegen den H1N1-Virus. Der eine heisst Focetria und wird aus Hühnereiern gewonnen. Diesen Impfstoff hat Swissmedic heute für die Schweiz zugelassen. Die EU und die USA haben das Novartis-Präparat bereits zugelassen. Der andere Impfstoff, Celtura, wird aus Zellkulturen gewonnen und ist in der Produktion günstiger, hierzulande aber noch nicht zugelassen «Es hat lange gedauert die Zulassung für Zelllinien, zur Herstellung von Medikamenten oder Impfstoffen, erteilt zubekommen», erklärt Nawrath.

Mögliche Stornierungen unproblematisch

Viele Länder, etwa die Schweiz, haben in der Aufregung um die Schweinegrippe bereits die doppelte Menge an Impfstoff bestellt, weil anfänglich mit zwei Impfungen pro Patient gerechnet worden war. Möglich ist daher auch die Stornierung von Bestellungen. Laut Nawrath ist dies für den Pharmahersteller aber kein Problem: «Novartis hat mehr als genug Orders. Zudem laufen noch Verhandlungen mit anderen Ländern», so der Analyst.

Attraktive Margen

«Das Geschäft mit Impfstoffen hat Margen von bis zu 50 Prozent», sagt Nawrath. Die Pandemie spielt dem Pharmagiganten in die Hände, denn für den Produzenten fallen weder Marketing- noch Verkaufskosten an. «Für dieses Jahr rechne ich wegen den Kosten für Forschung und Entwicklung mit einer Marge von etwa 30 Prozent», erklärt Nawrath. Novartis hat etwa eine halbe Milliarde in Infrastruktur investiert. Die Produktionsstätte in Liverpool wurde ausgebaut und eine neue Fabrik in den Staaten ist ebenfalls dazugekommen.

Der Verkauf des Impfstoffes wird laut Nawrath den Gewinn pro Aktie um 5 bis 10 Prozent erhöhen. Das sei bemerkenswert. =>

THE FLU CASE

Novartis rakes in profits from "swine flu" jab:
governments pay advertising and distribution costs

The Flu Case, 2 November 2009 13:34
https://web.archive.org/web/20091106034811/http://www.theflucase.com/index.php?option=com_content&view=article&id=1557%3Anovartis-rakes-in-profits-from-qswine-fluq-jab-governments-pay-advertising-and-distribution-costs&catid=1%3Alatest-news&Itemid=64&lang=en

Novartis is set to make bumper profits because of the "swine flu" jab, reports the Swiss media outlet 20 minutes.

Because governments are paying the costs of advertising and distributing the swine flu jab – and even giving the company immunity in case the product is "defect" - Novartis can book a high margin of its sales as pure profit.

Novartis could earn as much as 2 billion dollars from the orders for 200 million "swine flu" jabs it has received, it is estimated.

Beat Kraushaar

Impfzwang durch die Hintertür

Blick.ch, 1 November 2009, 17:15
https://web.archive.org/web/20091105053217/http://www.blick.ch/news/schweiz/aargau/impfzwang-durch-die-hintertuer-132293

Ohne Schweinegrippe-Impfung kein Lohn: Damit drohte das -aargauische Alters- und Pflegeheim Sunnhalde ihren Angestellten. Das geht zu weit, teilte das Staatssekretariat für Wirtschaft mit.

Leute in Pflegejobs sollen sich als Erste gegen die Schweinegrippe impfen lassen – damit das H1N1-Virus nicht auf Patienten überspringt. Doch gerade sie sind besonders impfresistent. Das wussten auch die Verantwortlichen des Alters- und Pflegeheims Sunnhalde in Untersiggenthal AG. Mit Druck wollte man das Pflegepersonal zur Impfung drängen.

Im Pandemie-Konzept des Heims, das SonntagsBlick vorliegt, wurde unverhohlen gedroht: Mitarbeiter die sich nicht impfen liessen, müssen beim Chef antraben. Dies zur «Klärung der Gründe und zur Unterzeichnung einer Bestätigung des Impf-Verzichts».

Im Falle einer Pandemie sahen die Sanktionen vor, dass Impf-Resistente nach Hause geschickt und deren Löhne gestrichen würden. Das Heim hätte den Zwangsurlaub als «unbezahlte Abwesenheit» taxiert. Als Alternative wird «der -Bezug von Ferien oder Überstunden» angeboten. Für das fehlende Personal wollte das Heim Zivil-dienstler rekrutieren. «Das kommt einem Impfzwang durch die Hintertür gleich», sagt ein Mitarbeiter.

Die Heimleitung hat sich bei ihren unzimperlichen Methoden auf den Rechtsdienst von Curaviva, dem Schweizer Verband für Heime und Institutionen, abgestützt.

Zu Unrecht, wie sich jetzt he-rausstellt. In einem Schreiben bezeichnet das Staatssekretariat für Wirtschaft (Seco) die angedrohten Massnahmen des Heimes als unzulässig. Und verweist darauf, dass im Streitfall das Arbeitsgericht abschliessend entscheiden müsse.

Die Heimleitung krebste nach SonntagsBlick-Recherchen zurück und korrigiert ihr Vorgehen. «Wir haben uns auf die rechtlichen Empfehlungen verlassen. Die scheinen aber tatsächlich auf wackligen Füs-sen zu stehen», sagt Heimleiterin ad interim Andrea Prati. Sollte der Fall eintreten, dass nicht -geimpftes Personal wegen der Pandemie zu Hause bleiben müsse, werde die Heimleitung den Lohn weiter zahlen, so Prati.

THE FLU CASE

Swiss Old Person's Home prohibited from forcing Staff to get the Swine Flu jab by withholding pay

The Flu Case, 25 November 2009 12:24
https://web.archive.org/web/20100102020925/http://theflucase.com/index.php?option=com_content&view=article&id=2064%3Aswiss-old-persons-home-prohibited-from-forcing-staff-to-get-the-swine-flu-jab-by-withholding-pay&catid=1%3Alatest-news&Itemid=64&lang=en

The management of an old's persons home in Sunnhalde in Switzerland have been prohibited from cutting off pay to staff and sending them home if they refuse to take the swine flu jab by the local government, according to the newspaper Blick.

Clinical Trials Arena

Pandemrix – Adjuvanted H1N1 Influenza Vaccine

Clinical Trials Arena, 1 November 2009
https://www.clinicaltrialsarena.com/projects/pandemrix/?cf-view&cf-closed

Pandemrix is an adjuvanted vaccine used in the prevention of the H1N1 (swine flu) virus infection and has been developed by GlaxoSmithKline Biologicals (GSK). The vaccine is a combination of H1N1 virus antigens and the adjuvant system AS03. The drug works by enhancing the natural immunity of the body.

Phase I clinical trials of Pandemrix were completed and the results were submitted to the Committee for Medicinal Products for Human Use (CHMP) on 14 September 2009. On 25 September 2009, the CHMP and US Food and Drug Administration issued a positive opinion and recommended the drug's approval to the European Commission. The European Commission granted marketing authorisation for Pandemrix to GSK on 30 September 2009.

The World Health Organization (WHO) officially declared on 11 June 2009 that Pandemrix should be used only for the Influenza A (H1N1) flu pandemic.

On 15 May 2009, GSK received orders from the US, France and Finland for the supply of the vaccine and agreed to supply the UK Government with 60 million doses of vaccine, the French Government with 50 million doses of vaccine and Finland with 5.3 million doses of vaccine.

The total number of doses of Pandemrix ordered reached 291 million by July 2009. Out of these, 195 million doses of the vaccine worth $250m have to be supplied to the US Government as per the contract signed by GSK. Later, nine other countries ordered a further 96 million doses of Pandemrix.

It was expected that the first doses would be supplied to governments from September onwards and shipments between late 2009 and early 2010.

On 14 September 2009, GSK released the results of its first clinical trial, stating the use of its vaccine. By September 2009, the results of clinical trials on more than 39,000 people demonstrated that AS03 is safe when used with the influenza vaccine.

The authorisation of Pandemrix was allowed under 'Exceptional Circumstances', as the authorisation had to be awarded based only on Phase I clinical trials.

Swine flu (H1N1)

The swine flu (H1N1) virus first came to the attention of doctors when an outbreak started in Mexico during April 2009, then creating a news frenzy as the number of cases increased at an alarming rate.

The symptoms of the disease include high fever, cough, runny or stuffy nose, sore throat, body aches, chills, fatigue or tiredness, extreme diarrhoea and vomiting.

In April 2009, when it was confirmed that the flu can transmit from human to human, the WHO raised the worldwide flu alert level from four to five, a level away from full pandemic. On 12 June 2009, the level was increased to six because the virus had shown higher spread within a population for a sustained period.

By 8 July 2009, the WHO had reported a total of 94,500 cases of influenza A (H1N1) in humans in 122 countries.

Targeting swine flu

Pandemrix contains parts of the flu strain A/California/7/2009 (H1N1) v-like strain (X-179A) and also contains GSK's proprietary adjuvant system AS03. The AS03 adjuvant contains tocopherol (vitamin E). The clinical trials of the H5N1 influenza strain proved that the adjuvant provides protection even if the strain drifts. Pandemrix contains small amounts of haemagglutinins (proteins from the surface) of a virus called A(H1N1) v and allows the immune system to defend itself against a disease.

The vaccine is administered by injection into the shoulder muscle, preferably as two single doses at least three weeks apart. A single dose of the vaccine consists of 3.75ug of antigen and AS03.

Pandemrix should not be administered to people who have had an anaphylactic reaction to any of the components of the vaccine. The vaccine should be given only with a prescription.

The common side effects identified with the administration of Pandemrix are headache, joint and muscle pains, reactions at the site of the injection, fever and fatigue.

Clinical trials demonstrate efficacy of Pandemrix

A total of 16 clinical trials were designed and out of these the Phase I trials were completed. The Phase I trials were designed to check the tolerability and immunogenicity of the pandemic (H1N1) adjuvanted vaccine (containing 5.25ug of antigen) in comparison with an unadjuvanted (containing 21ug) test study formulation. These trials were conducted in Germany by GSK and involved 130 healthy volunteers between 18 and 60 years of age. All clinical trials have been designed to follow the subjects for up to a year to notice the safety of the vaccine.

The European Medicines Agency (EMEA) announced that there was less clinical experience available on adults to whom a higher amount of Pandemrix antigen was given. It also stated that there is no clinical experience in older people, children and pregnant women.

After the EMEA's announcement, GSK started conducting additional 15 studies in over 9,000 subjects. They included healthy adults in Europe, Canada and the US. The drug maker also announced that it will run initial trials in a healthy population but not in pregnant women.

Even though there is no clinical data for pregnant women and children, these groups are given major importance by the European Commission and WHO for the administration of the vaccine.

Results of the first clinical trials released by GSK in September 2009 stated that one dose of Pandemrix can generate a strong immune response that is higher than the immunogenicity criteria stated by international licensing authorities.

At first, Pandemrix was developed as a 'mock-up' vaccine, by selecting an H5N1 strain called A/Vietnam/1194/2004. The company noticed the ability of this mock-up vaccine as it increased the production of antibodies.

The mock-up vaccine was proven to produce the antibodies in a minimum of 70% of people on whom studies were carried out. This demonstrated that the vaccine provides an appropriate level of protection.

Based on the data provided by mock-up vaccine and strain drifts, the CHMP announced that Pandemrix has more benefits than risks for the prevention of swine flu.

Marketing commentary

When the Pandemrix vaccine first became available, it was expected that the demand would be greater than the supply. It is expected that the gap may reduce as more vaccine is released over time.

GSK is conducting meetings with more than 50 governments of developed and developing countries to determine supplies of Pandemrix. Meanwhile, governments are already evaluating and determining their vaccination policies and target groups within their specific countries.

GSK has allotted 20% of the Pandemrix production to its manufacturing facility in Canada, to distribute the vaccine to developing countries from September 2009. GSK is following the policy of tiered pricing for Pandemrix, based on the World Bank classification of countries and GAVI eligibility.

Russia to start swine flu vaccine tests on children on Monday

RIA Novosti, 2 November 2009
https://old.fsvps.gov.ru/fsvps/press/945.html?_language=en

Russia is planning to start testing swine flu vaccines on children on Monday, a deputy health minister said.Veronika Skvortsova said the results of clinical tests on adults showed the vaccines were safe.According to Russia's Health Ministry, four swine flu vaccines have been so far registered in the country.

A spokesman for the Microgen company involved in producing the vaccines said Russia's health watchdog Roszdravnadzor allowed testing the vaccines on children, adding the tests were set to be conducted at medical research institutions in the cities of St. Petersburg, Smolensk and Perm.

A spokesman for Petrovaks, another company involved in producing swine flu vaccines, earlier said the company was also ready to start testing the vaccines on children.

The production of two vaccines against swine flu has already started in Russia, with at least 35.5 million single doses expected to be produced by the end of the year.

Five deaths from the H1N1 virus have been so far registered in the country. Three fatalities were reported in the east Siberian city of Chita, one in Moscow, and another one in the Siberian Krasnoyarsk region. The total number of officially confirmed swine flu cases in the country has reached almost 1,900.

Russia's chief sanitary official, Gennady Onishchenko, earlier said the swine flu cases began growing considerably in October, traditionally the time for a seasonal flu outbreak. The country plans to start a swine flu vaccination program in December.

According to the World Health Organization, more than 5,700 people have died from swine flu worldwide, and the total number of officially confirmed cases has exceeded 440,000, as of October 25.

Large-scale immunization campaigns aimed at fighting swine flu are underway in several countries, including the United States and Japan.

New group helps US monitor swine flu shot safety

Reflector // The Associated Press, 2 November 2009, 09:32 a.m. EDT
https://web.archive.org/web/20091105030916/http://www.reflector.com/features/new-group-helps-us-monitor-swine-flu-shot-safety-931806.html

Washington – Independent health advisers begin monitoring safety of the swine flu vaccine on Monday, an extra step the government promised in this year's unprecedented program to watch for possible side effects.

Decades of safe influenza inoculations mean specialists aren't expecting problems with theswine flu vaccine, because it's made the same way as the regular winter flu vaccine. But systems to track the health of millions of Americans are being tapped to make sure – to spot any rare but real problems quickly, and to explain the inevitable false alarms when common disorders coincide with inoculation.

U.S. health officials have spotted no concerns to date, Dr. Bruce Gellin, head of the National Vaccine Program Office, told The Associated Press.

A specially appointed working group of independent experts will track the vaccine's safety, too. Although the group will deliberate in private meetings, starting Monday, its charge is to raise a red flag if members feel the feds miss anything.

"Given the rapidity with which this particular vaccine was rolled out, there seems to be an extra-special obligation to make sure things remain as uncomplicated as they have in the past," Dr. Marie McCormick of the Harvard School of Public Health, who chairs the working group, told the AP.

Vaccinations against the new flu, which scientists call the 2009 H1N1 strain, have begun more slowly than the Obama administration had hoped, with long lines for the nearly 27 million doses divided around the country so far. More is on the way, even as swine flu cases and hospitalizations continue to rise.

How many ultimately line up depends in part on public confidence in the vaccine's safety. While vaccine side effects always are monitored, the H1N1 inoculations are getting extra scrutiny in part because the last mass vaccinations against a very different swine flu, in 1976, were marred by reports of a rare paralyzing condition, Guillain-Barre syndrome.

A report in The Lancet British medical journal on Friday said the intense monitoring will be crucial for an additional reason: separating normal disease rates from real vaccine risks. For example, 2,500 miscarriages occur every day in the U.S., and about 3,000 heart attacks – and some are sure to coincide with vaccination yet not be caused by it.

Monday, McCormick's group will hear safety data from studies of the swine flu vaccine in more than 10,000 people, some conducted by the government and others by manufacturers.

"To date, no serious adverse events have suggested any safety signals with H1N1 vaccines," says a summary of the data – although it cautions that the studies aren't large enough to rule out any very rare risk.

That's where the additional monitoring comes in.

Initial reports to a beefed-up government database – where anyone can report any symptom, and serious ones get intense investigation – showed nothing unusual after the first 10 million vaccinations, Gellin said. Most reports were of sore arms and fever, plus some flu symptoms that suggested people already were infected when they got the shot, too late for it to help.

Gellin said one report of a death turned out to be caused by swine flu itself, not vaccine.

Other monitoring includes linking large insurance databases to state vaccine registries to track who visits a doctor and why after the shot, a program covering about 20 million people. Plus, there's specially targeted tracking of pregnant women, and work to tell if the risk of Guillain-Barre – which regularly strikes about 1 in every 100,000 people – really is increased slightly by flu vaccine or not.

If serious problems were to crop up, federal law makes vaccine manufacturers and health officials immune from lawsuits. But it allows for a compensation fund for proven serious side effects, just as happens today with routine child vaccinations. Health and Human Services officials are developing such a program for swine flu vaccine, just in case it's needed, spokesman Bill Hall said.

Government appoints Task Force to Handle H1N1 vaccine Propaganda

Prison Planet, 2 November 2009

https://web.archive.org/web/20091108072844/http://www.theflucase.com/index.php?option=com_content&view=article&id=1583%3Aus-government-appoints-vaccine-insiders-to-monitor-qswine-fluq-jab-safety&catid=1%3Alatest-news&Itemid=64&lang=en

Health advisers who previously dismissed vaccine-autism link will "explain false alarms" to public when injuries "coincide" with shots

The U.S. government has appointed what the media is ludicrously billing as an "independent" group of health advisors whose job it will be to whitewash adverse reactions to the swine flu vaccine and "explain" them to the public as mere coincidence.

Authorities have been busier honing their propaganda about the H1N1 inoculation program than they have dealing with the actual rollout of the vaccine. A $16 million dollar campaign to coerce Americans into taking the shot is falling flat on its face with increasing numbers rejecting the necessity to take the shot amidst concerns about its side-effects.

Health authorities have been desperately pushing the notion that the vaccine is safe as part of a gargantuan PR campaign, without explaining why well-connected members of the elite have had special access to an additive-free version of the shot that doesn't contain ingredients like mercury and squalene that are contained in the public version.
https://web.archive.org/web/20091125084144/http://www.infowars.com/german-chancellor-ministers-get-special-vaccine-without-soft-kill-ingredients

As a result of the dangers of the H1N1 vaccine becoming widely known, authorities are moving to get out ahead of the story by acknowledging that millions of health problems in the aftermath of a vaccination campaign will be blamed on the vaccine, citing the 1976 swine flu debacle when the shot proved far deadlier than the actual virus.

Back in September, Reuters reported on how public health officials were expecting "an avalanche of so-called adverse event reports, which are reports of death, illness or other health trauma," in the two weeks after people receive the vaccine.

https://web.archive.org/web/20100103013122/http://www.reuters.com/article/idUSTRE58F3A720090916

"We are going to be overwhelmed with potential events," said Mike Osterholm, a public health expert at the University of Minnesota.

Authorities therefore resolved to dismiss any connection to the swine flu shots a host of heart attacks, strokes and miscarriages that "will be blamed on the H1N1 vaccine".

Now the government has accelerated these efforts by appointing a group of "independent" experts to "track the vaccine's safety," according to an Associated Press report.

https://web.archive.org/web/20091105030916/http://www.reflector.com/features/new-group-helps-us-monitor-swine-flu-shot-safety-931806.html

The claim that the group is "independent" is a complete misnomer. How can a group appointed by and dictated its brief by the government be considered "independent"?

In addition, the group will be headed up by none other than Dr. Marie McCormick of the Harvard School of Public Health. McCormick and her affiliated organizations have routinely issued reports over the past 10 years supporting the government's position on the link between vaccines and autism, dismissing a correlation entirely despite overwhelming evidence that contradicts this notion. McCormick has been widely criticized by other health experts for her dogged denial of the link between vaccines and autism.

=> https://web.archive.org/web/20091007231108/http://www.prisonplanet.com/autism-explodes-as-childhood-vaccines-increase.html

So far from being "independent," the group is in fact appointed by the government and lead by one of the government's chief whitewash proponents in the context of vaccine dangers and side-effects.

The rollout of the vaccine has been limited to far fewer people than the government originally intended, partly due to a supply shortage and partly because more than half of Americans have refused to take the shot. The government's efforts to dismiss concerns about side-effects will likely kick into high gear when more batches of the vaccine become available.

The media is framing concerns about side-effects by concentrating on health problems in the immediate aftermath of the vaccination, thereby providing them with the ammunition to dismiss concerns about side-effects altogether if few cases of death or injury occur. However, the real concerns about the dangers of vaccines do not revolve around skin rashes or minor ailments, they relate to the longer term effect of the build-up of toxic mercury in the body as well as squalene and the cancerous animal cells that are admittedly contained in the vaccine. Symptoms could therefore take months or even years to manifest, enough time for a connection to the swine flu shot to be forgotten in the public eye. Expect this to be exploited to the maximum by the "independent" experts the government has appointed to whitewash dangers associated with the vaccine

THE FLU CASE

WHO worried by low take up of Swine Flu Jab

The Flu Case, 3 November 2009, 11:25
https://web.archive.org/web/20091109045338/http://www.theflucase.com/index.php?option=com_content&view=article&id=1573%3Awho-worried-by-low-take-up-of-swine-flu-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

WHO press officer Gregory Hartl said yesterday that the organisation was "seriously" worried by the low up take of the untested and toxic "swine flu" jab recommended by WHO in July after a meeting of the Geneva-based organisation's vaccine advisory board attended by executives from big pharma, including Baxter, Novartis and GSK.

In response to questions about a recent poll showing that 86.4 % of the people in Switzerland have no intention of taking the jab, Hartl said: "It is a reaction that is difficult to understand."

Hartl said that pregnant women were more at risk from the swine flu than from the swine flu jab even though there are no clinical data on the swine flu jab in pregnant women, and so he cannot have a factual basis for making such a statement.

In addition, he falsely claimed that the "swine flu" jab has no more side effects than the seasonal flu even though the European drug regulators, the EMEA, themselves state that the safety and efficacy of the jab will not be proven when it is administered to people under emergency regulations.

WHO supplied Baxter with the live bird flu virus that Baxter's Austrian subsidiary used to contaminate 72 kilos of seasonal flu, nearly triggerign a bird flu pandemic this February.

In the event of a pandemic level 6 emergency being declared by WHO as happened in June, WHO obtains special powers over country's health and police services and government.

Grippe porcine: l'OMS s'inquiète du refus de se faire vacciner

L'OMS est préoccupée par le refus de nombreuses personnes de se faire vacciner contre la grippe A(H1N1). La vaccination comporte beaucoup plus d'avantages que de risques, a affirmé un porte-parole. Elle est vitale pour les groupes à risques.

"C'est une réaction difficile à comprendre", pour le porte-parole de l'OMS Gregory Hartl, interrogé sur le récent sondage montrant que 86,4% des Suisses n'ont pas l'intention de se faire vacciner. "Que le vaccin ne soit pas utilisé par ceux qui en ont le plus besoin nous préoccupe sérieusement", a-t-il déclaré.

"La vaccination est la meilleure manière de lutter contre la pandémie et les avantages à se faire vacciner l'emportent largement sur les risques".

Il a insisté sur les femmes enceintes, qui en l'absence de vaccination, risquent de très sérieuses complications, et même une issue fatale, si elles sont infectées par le virus.

Les groupes à risques (femmes enceintes, enfants de moins de deux ans, malades chroniques) peuvent être très gravement malades en l'absence de vaccination, a souligné le porte-parole, en rappelant que la grippe porcine a déjà fait plus de 5700 morts dans le monde.

"Les effets secondaires du vaccin ne sont pas différents de ceux connus pour la grippe saisonnière. Lorsqu'il y en a, ils sont bénins et temporaires. Nous n'avons pas constaté de complications inattendues jusqu'ici", a assuré Gregory Hartl.

L'OBS

Grippe A: Baxter dévoile la totalité de son contrat avec l'Etat

Rue89, 3 November 2009,13:45
https://web.archive.org/web/20091106013652/http://www.rue89.com/2009/11/03/grippe-a-un-depute-obtient-la-publication-complete-du-contrat-baxter-124489

C'est une victoire de la transparence de l'information. Le laboratoire Baxter, le seul à avoir négocié une clause de confidentialité sur son contrat avec l'Etat, vient d'autoriser sa publication ce mardi. Rue89 le diffuse en exclusivité.

Vendredi, nous avions rendu publics les contrats conclus entre les labos et l'Eprus, la pharmacie de l'Etat, pour un montant de 674,9 millions d'euros hors taxe. Mais pour Baxter, qui fournira 50 000 vaccins non-adjuvantés et fabriqués sur la base de souches entières, le Celvapan, au prix de 10 euros la dose, aucun élément n'était jusque-là communicable.

Baxter était plus ciblé que les autres laboratoires par les anti-vaccin depuis qu'en février du matériel viral de laboratoire avait été accidentellement contaminé par une souche de grippe aviaire dans un laboratoire en Autriche.

Le député Gérard Bapt (PS), rapporteur spécial du budget de la sécurité sociale à l'Assemblée nationale, a conseillé au laboratoire de « lever tout soupçon », et demandé personnellement au président français de la compagnie américaine d'autoriser cette publication. Il ajoute que:

«Contrairement à ce qu'affirme Madame Bachelot dans un communiqué repris par l'AFP, ce n'est pas elle qui a demandé la levée de la confidentialité, c'est moi qui ait convaincu le patron de la firme. Ma surprise est qu'il a levé la clause sur l'ensemble du contrat.»

«Le manque d'efficacité (…) pas une violation de la garantie»

Le contrat que nous publions aujourd'hui est donc plus complet que pour les autre laboratoires. Y est confirmée la responsabilité assumée par l'Etat en cas de recours juridique, mais Baxter semble particulièrement protégé puisqu'il est écrit que:

«La survenance d'effets indésirables attendus ou inattendus ou le manque d'efficacité ne constitueront pas une violation de la garantie» (page 5)

Baxter aurait par ailleurs droit au versement d'intérêts si l'Etat dépassait son délai de paiement.

L'absence d'obligation de résultat du laboratoire est criante:

«Baxter devra faire ses meilleurs efforts pour livrer les 50 000 doses avant la fin de l'année 2009. Baxter mettra en oeuvre tous les moyens commercialement raisonnables pour livrer 12 000 doses avant fin août. (…) Toutefois, le défaut de livraison ne sera pas constitutif d'une violation du présent marché». (page 7)

Une commande de 150 000 vaccins contre la méningocoque glanée au passage

On apprend aussi que l'Eprus, donc l'Etat, « ne pourra exercer aucun recours ni action en indemnisation contre Baxter» dans le cas où Baxter livrait des vaccins non conformes et ne parvenait pas à les remplacer dans un délai rapide.

Par ailleurs, Baxter obtient dans le même temps l'activation d'une commande pour 150 000 doses de vaccins NEISVAC (montant du marché : entre 1 et 3 millions d'euros), pour lesquels l'Etat avait mis une option en décembre 2008. Cela s'expliquerait par le fait que la grippe pandémique pourrait réactiver la méningite bactériennes à méningocoque C, selon le Haut Conseil de la Santé Publique.

Y est confirmé par ailleurs que la livraison de vaccins était prévue sans autorisation de mise sur le marché (AMM), en cas d'urgence -clause qui n'aura pas à être activée, l'AMM ayant été accordée.

=> Marché public n° EPRUS/09-36 relatif à l'acquisition de vaccins contre le virus H1N1.

THE FLU CASE

Baxter forced to disclose secret contract with French government: Company cannot be prosecuted

The Flu Case, 4 November 2009, 13:00

https://web.archive.org/web/20091122075538/http://www.rue89.com/files/2009_11_03_Contrat_Baxter.pdf
https://web.archive.org/web/20091108072430/http://www.theflucase.com/index.php?option=com_content&view=article&id=1592%3Abaxter-forced-to-disclose-secret-contract-with-french-government-company-cannot-be-prosecuted&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Baxter, the pharmaceutical company, cannot be prosecuted for any damage or death caused by its swine flu vaccines under the terms of the secret contract it sealed with the French government, it has emerged.

Baxter was forced to disclose the full contract after Gerard Bapt, a member of the finance committee of the French National Assembly, intervened.

The French government has kept the "swine flu" vaccine contract a secret for reasons of commercial confidentiality.

The contract reveals that Baxter can avoid all responsibility before the law for its 50,000 swine flu vaccines costing 10 euros each.

In addition, it shows that Baxter is set to deliver 150,000 vaccines against meningitus, a disease that can result in permament brain damage and death, as part of the French government's vaccination campaign against the "swine flu" pandemic.

The news that the French government took out an option to order Baxter's NESVAC meningococcal vaccines in such large quantities in December 2008 to tackle a pandemic will come as a suprise to many people. But a French public health body recommended the meningitus vaccines, allegedly because there was a higher risk of meiningococcal infection during a pandemic.

NESVAC contains 0.5 mg of an aluminium adjuvant, adding new toxic ingredients and dangerous viruses to the brew of Celvapan, Pandemrix and Focetria swine flu jabs.

The contract shows that Baxter does not even have to have regulatory authorisation to put its "swine flu" jabs on the French market.

The company has been given blanket immunity from any prosecution or penalties.

The government "will not have any recourse to any action of indemnity" against Baxter in case Baxter delivers vaccines that do not conform to standards, the contract states.

"Undesirable side effects, expected or not expected, or a lack of efficacy" cannot be the basis for any claim, says the contract.

Baxter sealed the contract with a special government health body set up in March 2007 to deal with national health emergencies called L'EPRUS (L'Etablissement de Preparation et de Reponse aux Urgences Sanitaires).

L'EPRUS, headed by Thierry Coudert, gains sweeping powers in the event of a pandemic emergency, including the power to conclude contracts with pharmaceutical companies.

Baxter's Austrian subsidiary was found to have contaminated 72 kilos of seasonal flu material with the live bird flu virus this February, nearly sparking a global bird flu pandemic according to the Times of India.

Because Baxter is required to implement biosafety level 3 standards when handling the bird flu, an accidental contamination can be ruled out.

The incident is the subject of a criminal investigation by the Austrian police, though so far no action appears to have been taken.

The contract is so loose that Baxter could theoretically contaminate its 50,000 swine flu vaccines destined for France with the live bird flu virus - and still face no prosecution.

The news that Baxter has been given carte blanche to deliver vaccines that do not even require regulatory approval and that the company cannot be prosecuted no matter what it does will fuel concerns that pharmaceutical companies and government bodies are working hand in hand to maximise profits while ignoring all public safety considerations.

The French Health Minister Roseylne Bachelot -- ultimately responsible for the operation of L'EPRUS – airbrushed her 12 years of employment for pharmaceutical companies from her CV, underlining the close but often hidden links between government officials and the pharma industry.

Philipp Rösler: Lassen Sie sich gegen die Schweinegrippe impfen?

BILD, 4 Novembre 2009
https://www.bild.de/politik/2009/lassen-sie-sich-gegen-schweinegrippe-impfen-10344706.bild.html

Rösler rät zur Impfung: Der neue Gesundheitsminister Philipp Rösler rät den Deutschen zur Schweinegrippe-Impfung. Vor allem Kinder und Schwangere sollten es tun.

BILD: Her Minister, lassen Sie sich auch impfen?
Rösler: Ja, weil Impfen der beste Schutz ist. Ich habe mich diese Woche gegen die saisonale Influenza impfen lassen und Ende nächster Woche werde ich mich gegen die Neue Grippe – die so genannte Schweinegrippe – impfen lassen.

BILD: Es gibt in Deutschland für die Bürger einen anderen Impfstoff als etwa für Soldaten. Sind Verwirrungen da nicht programmiert?
Rösler: Es sind Impfstoffe von zwei unterschiedlichen Herstellern. Diese sind aber in ihrer Wirkung gleichwertig. Keiner ist besser oder schlechter. Alle in Deutschland verfügbaren Impfstoffe sind geprüft und sicher. Nebenwirkungen können immer vorkommen, aber die sind in der Regel nur vorübergehend.

BILD: Wird jeder geimpft, der sich impfen lassen möchte?
Rösler: Je mehr sich impfen lassen, desto größer ist der Schutz für uns alle. Die Ständige Impfkommission hat das bestätigt. Allerdings: Der Impfstoff liegt nicht auf Halde und für bestimmte Risikogruppen, das medizinische Personal, Polizei und Feuerwehr, ist die Impfung besonders wichtig. Deshalb werden zuerst diese Menschen geimpft und dann jeder, der das möchte.

BILD: Ist der bestellte Impfstoff ausreichend?
Rösler: Der bestellte Impfstoff wird nach und nach produziert und an die Bundesländer ausgeliefert. Es kann sein, dass vereinzelt Wartezeiten auftreten. Niemand muss sich Sorgen machen: Der Impfstoff wird laufend nachgeliefert.

BILD: Sollen sich Kinder und Schwangere impfen lassen?
Rösler: Grundsätzlich ist auch hier der Impfschutz wichtig. Im Gespräch mit dem Arzt oder der Ärztin muss hier in jedem Fall gesondert entschieden werden. Eine Schwangere, die in der Kita arbeitet, hat unter Umständen ein höheres Ansteckungsrisiko. Da kann impfen sinnvoll sein. Das gleiche gilt, wenn ein Kind etwa eine chronische Erkrankung hat.

BILD: Wie wird sich die Schweinegrippe entwickeln?
Rösler: Eine sichere Voraussage kann keiner machen. Die Experten erwarten, dass besonders mit der kälteren Witterung die Zahl der Infektionen zunimmt. Wir sehen, dass die Zahlen ansteigen. Deswegen ist Vorsorge wichtig: angefangen bei der persönlichen Hygiene wie häufigem Händewaschen bis zur Impfung. Die Impfung ist der beste Schutz vor der Neuen Grippe.

Scientists, who work for WHO influenza laboratory, hold patent for bioengineered swine flu virus

The Flu Case, 4 November 2009, 14:07
https://web.archive.org/web/20100102040645/http://theflucase.com/index.php?option=com_content&view=article&id=1594%3Ascientists-who-work-for-who-influenza-laboratory-hold-patent-for-bioengineered-swine-flu-virus&catid=1%3Alatest-news&Itemid=64&lang=en

Two of the scientists who filed for a patent for a genetically engineered, artificial swine flu virus, work for WHO and St Jude's Children Research Hospital.

New Zealanders Robert Webster and Richard Webby are listed as patent holders for the US Patent Application 20090010962 - Genetically Engineered Swine Influenza Virus and Uses Thereof

Robert Webster holds the Rose Marie Thomas Chair in Virology at St. Jude Children's Research Hospital. He is also director of the World Health Organization Collaborating Center on the Ecology of Influenza Viruses in Lower Animals and Birds, the world's only laboratory designed to study influenza at the animal-human interface, according to Wikipedia.

Richard Webby is an Associate Member, St. Jude Faculty and a Director, World Health Organization Collaborating Center for Studies on the Ecology of Influenza in Animals and Birds, according to an entry on St Jude's website.

1. An attenuated swine influenza virus comprising a mutation in a swine influenza NS1 gene that diminishes the ability of the NS1 gene product to antagonize the cellular interferon response, and permits the attenuated virus, at a multiplicity of infection of 0.001, to grow to titers between approximately 3 fold to approximately 7 fold lower than wild-type swine influenza in pig cells, as determined approximately 5 days post-infection when propagated under the same conditions.

WHO bekymret for høye norske dødstall

Dagdladet, 4 November 2009
http://www.dagbladet.no/2009/11/04/nyheter/svineinfluensa/innenriks/helse/utenriks/8872508

Helsedirektøren vurderer å be om hjelp om to uker. Avviser at Norge har takket nei til eksperthjelp.

(Dagbladet): I dag melder VG at Norge takket nei til en forespørsel om hjelp fra Verdens helseorganisasjon (WHO) rundt kartleggingen av det relativt høye antallet svineinfluensa-dødsfall i her til lands.

Det avvises nå av helsedirektør Bjørn Inge Larsen og helseminister Anne Grete Strøm-Erichsen.

Skrev brev

- Den saken er feil, det er vi som først tok kontakt med pandemiansvarlig i WHO, Keiji Fukuda. Vi har ikke takket nei til noe fra WHO og de har heller ikke avvist å stille med noe, sier helsedirektør Bjørn Inge Larsen til Dagbladet i dag.

I forbindelse med bestilling av nye vaksiner fra legemiddelfirmaet GlaxoSmithKline, skrev helseminister Strøm-Erichsen følgende:

«Influensapandemien sprer seg nå raskt gjennom landet og tettbebodde strøk har til nå blitt hardest rammet. Sammenlignet med andre europeiske land har vi en høyere dødsrate, til den grad at WHO har uttrykt bekymring og har tatt kontakt med våre helsemyndigheter for å tilby assistanse», heter det i brevet ifølge VG.
Deretter siteres helseministeren av VG på at Norge har avvist å motta assistanse fra WHO.

Telefonsamtale

Dette stemmer ikke, ifølge helsedirektøren.
- Her henvises det til en telefonsamtale, der WHOs pandemisjef Keiji Fukuda kontaktet meg for å vise sin oppmerksomhet og si at de var klar over de høye dødstallene i Norge som følge av svineinfluensa. Vi drøftet mulige årsaker og tiltak. Jeg redegjorde deretter for at vi vil gjennomgå de norske dødsfallene for å se etter fellesnevnere vi ikke har oppdaget før, og at dersom de høye tallene i Norge fortsetter, så vil det være aktuelt for oss å kontakte WHO, sier Larsen.

Ifølge helsedirektøren fant samtalen sted forrige uke, mandag eller tirsdag.

- Det kan være vi ber om hjelp fra WHOs eksperter for å kartlegge og gjennomgå dataene. Det vil være klart om et par uker, sier Larsen.

WHO slår larm efter norska dödsfall

Aftonbladet, 4 November 2009
https://www.aftonbladet.se/nyheter/a/7lPzyV/who-slar-larm-efter-norska-dodsfall

Världshälsoorganisationen, WHO, är oroliga över att svininfluensan skördat så många dödsfall i Norge och vill nu skicka en expert.

Men Norge säger nej. Det skriver VG i dag.

Det var i måndags som norska hälsoministern Anne-Grete Strøm-Erichsen (Ap) skrev ett brev till VD:n för läkemedelsföretaget GlaxoSmithKline.
”Influensapandemin sprider sig snabbt i hela landet och tätbefolkade områden har nu drabbats hårdast. Jämfört med andra europeiska länder har vi en högre dödlighet, vilket lett till att WHO uttryckt oro och kontaktat vår hälsomyndighet för att hjälpa till”, skriver hälsoministern i brevet.

Bad om ytterligare doser

Hälsoministern skrev brevet efter att 170.000 doser av influensavaccin Pandemrix gått förlorade vid en olycka i en fabrik i Belgien. I brevet bad hon därför läkemedelsjätten att få ytterligare doser så snart som möjligt.

Nej till hjälp

Hälsoministern Anne-Grete Strøm-Erichsen bekräftar att man sagt nej till hjälpen från WHO.

– Vi har fortlöpande dialog med WHO, men avvaktar erbjudande om hjälp. De vet att vi har vaccin och gör vad vi kan, säger hälsoministern.

Sammanlagt har Norge beställt 9,4 millioner doser av vaccinet, vilket beräknas räcka till alla norrmän.

Sammanlagt ska 13 personer avlidit till följd av svininfluensan i Norge, enligt de senaste uppgifterna.

H1N1 Vaccination Clinic for Pregnant Women, Children Friday in Aberdeen

The Dagger, 4 November 2009
https://www.daggerpress.com/2009/11/04/h1n1-vaccination-clinic-for-pregnant-women-children-friday-in-aberdeen/

The Harford County Health Department will offer the injectable H1N1 vaccine to pregnant women and children aged 6 months to 18 years, on Friday, November 6th at Ripken Stadium in Aberdeen from 10 a.m.-3 p.m., rain or shine.

Health Department spokesman Bill Wiseman said the clinic is restricted to pregnant women and children, who are among the prioritized groups recommended to receive the vaccine by the national Centers for Disease Control and Prevention. Wiseman said sufficient supply of the H1N1 vaccine was on hand locally to conduct a "sizeable clinic" on Friday.

The preservative-free H1N1 vaccine will also be available in limited quantities for pregnant women who prefer that form of the vaccine.

Pentagon sends H1N1 vaccine to Central Command area

American Forces Press Service, 5 November 2009
https://www.army.mil/article/29871/pentagon_sends_h1n1_vaccine_to_central_command_area

Washington (Nov. 4, 2009) – U.S. Central Command has received half of the vaccine needed to inoculate its forces against the H1N1 virus, Pentagon Press Secretary Geoff Morrell said today.
The vaccines arrived in Qatar overnight and should be pushed out to troops serving in Iraq, Afghanistan, Kuwait and other parts of the region within the next day, Morrell said. About 300,000 forces serve in the command's area of responsibility.

Meanwhile, roughly 26,000 doses arrived in South Korea this week for servicemembers assigned there, Morrell said.
"So we're making some progress in terms of getting the H1N1 vaccine to our forces worldwide," he said. "But because we are still operating with a limited quantity, we have to prioritize those who will get it. And according to our prioritization list, our military forces and those who support them are at the top of that list."

The Defense Department does not yet have enough of the vaccine to treat all servicemembers, their families and other support personnel. The department received its initial allotments of the vaccine last week and began distributing them according to a prioritized list of recipients. Vaccines will be made available first to deployed troops, then to deployed health-care workers, including civilian employees and contractors.

"It is imperative that we keep our forces able to do their jobs so as to provide for the protection of our interests around the world," Morrell said.
"They are already in very difficult circumstances. Every one of them is needed, and we can't afford to have an outbreak of the [H1N1] flu in Afghanistan, in Iraq, in any other location where our forces are deployed," he said. "So we're doing everything within our power to make sure our guys downrange get this as soon as possible."

The department also has received several hundred vaccines from the Health and Human Services Department for defense civilians. Because vaccines are coming in relatively small numbers, local commanders are responsible for determining how supplies are distributed.

Immunization for both seasonal flu and H1N1 is mandatory for all military personnel and is highly recommended for family members.

When the first cases of H1N1 were diagnosed in the United States in April, the department bought 2.7 million doses of the vaccine for mission-assurance purposes. HHS later provided 1 million doses to the department, raising the number to 3.7 million, officials said.

In addition to vaccines being received for operational personnel, Defense Department medical treatment facilities now are receiving vaccine for family members living in the United States. Pentagon officials also have an agreement with HHS to provide the vaccine for family members living outside the United States.

Vaccine for family members and the civilian work force will arrive at military medical treatment facilities incrementally, department officials said.

The Sydney Morning Herald

WHO urges people to maintain guard over swine flu

The Sunday Morning Herald, AFP, 5 November 2009, 01:16 pm
https://www.smh.com.au/world/who-urges-people-to-maintain-guard-over-swine-flu-20091106-i0i3.html

The World Health Organisation on Thursday urged people not to drop their guard over the swine flu pandemic and insisted on the value of vaccination despite the broadly mild symptoms of the virus.

"At the WHO we remain quite concerned about the pattern we are seeing, particularly because a sizeable number of people do develop serious complications and death," said Keiji Fukuda, special adviser on pandemic.

"Again, we are seeing most of this develop in people who are younger than 65 years, a picture which is different from seasonal influenza," he explained.

Fukuda reiterated that the cases of serious complications were largely found among the chronically ill, pregnant women as well as some otherwise healthy younger people.

He also countered signs of public scepticism about the vaccine revealed by surveys in several countries, despite the resurgence of swine flu in the northern hemisphere with the onset of the colder season.

"WHO believes that these *vaccines are very useful* against the pandemic virus," Fukuda said in a telephone news conference.

Vaccination against A(H1N1) influenza has now started in more than 20 countries and were demonstrably safe, according to the WHO.

"What we are seeing is that these *vaccines are highly safe* and have been received by a significant number of people without any problems," Fukuda said.

Swine flu has differed from seasonal flu in persisting in the northern hemisphere during the summer period and in a pattern of occasional serious illness affecting under 65-year-olds.

However, Fukuda acknowledged that it was as transmissible as seasonal flu, showed the same pattern of spreading more widely in winter and was "self limiting" in that the large majority of people who caught it got better without the need for special treatment.

More than 5,700 people have died worldwide since the pandemic virus was first discovered in April, with most deaths – 4,175 – reported in the Americas region, according to WHO data.

Le Monde

Le vaccin anti-H1N1 produit à base de cultures cellulaires autorisé en Allemagne

Le Monde avec Reuters, 5 novembre 2009, à 14h 00,
https://www.lemonde.fr/planete/article/2009/11/05/le-vaccin-anti-h1n1-de-novartis-produit-a-base-de-cultures-cellulaires-autorise-en-allemagne_1263283_3244.html

Le groupe pharmaceutique suisse a reçu l'autorisation des autorités allemandes de commercialiser son vaccin Celtura, produit à partir de cultures cellulaires à base de reins de chiens plutôt qu'à base d'œufs de poules.

Le groupe pharmaceutique suisse Novartis a reçu l'autorisation des autorités allemandes de commercialiser son vaccin Celtura contre la grippe A(H1N1), un vaccin produit à partir de cultures cellulaires à base de reins de chiens plutôt qu'à base d'œufs de poules. Le vaccin, comprenant l'adjuvant MF59, est recommandé pour des enfants à partir de 6 mois et les adultes, a précisé le laboratoire bâlois dans un communiqué.

Cette technique cellulaire, dont Novartis affirme qu'elle a déjà été brevetée en Europe pour la production de vaccins contre la grippe saisonnière, permet une production plus rapide du vaccin que la méthode classique de culture du virus dans des œufs de poule. Novartis s'attend maintenant à recevoir l'homologation *"d'autres grands pays, notamment le Japon et la Suisse"* pour le Celtura.

L'autorité sanitaire helvétique avait jusqu'à présent réservé sa décision quant à la demande d'autorisation de ce vaccin anti-H1N1 de Novartis, fabriqué par culture cellulaire. Le groupe avait démenti fin octobre que son vaccin puisse être refusé en raison de contaminations par des bactéries, après des révélations dans la presse suisse.

Schwäbisches Tagblatt

Virusabwehr startet holprig: Engpässe beim Impfstoff gegen Schweinegrippe

Schwäbisches Tagblatt, 5 November 2009
https://web.archive.org/web/20100416102447/http://www.tagblatt.de/Home/nachrichten/tuebingen_artikel,-Engpaesse-beim-Impfstoff-gegen-Schweinegrippe-_arid,82726.html

Die Schweinegrippe selbst spielt im Landkreis Tübingen noch keine große Rolle. Die Aufregung um den Impfstoff aber wächst – schon weil er kaum zu haben ist.

Tübingen. Manche warnen vor einem viralen Tsunami. Aber davon kann im Fall der Schweinegrippe für den Kreis Tübingen bisher keine Rede sein. Nur als kleine Welle hat die neue Grippe den Kreis erreicht. Im Landratsamt wusste man gestern von 115 bestätigten Fällen der Influenza des Typs H1N1. Das sind etwa 30 Fälle mehr als vor zwei Wochen.

Die Amtsärzte haben noch niemand im Landratsamts-Mitarbeiter gegen geimpft. Und das, obwohl "wir die Impfung empfehlen", wie der Behördensprecher Egon Betz sagt. Nur: Die Gesundheitsabteilung der Landkreisverwaltung hat noch nichts von dem bereits vor Wochen beim Landes-Sozialministerium bestellten Impfstoff erhalten. "Wir hoffen, dass er in den nächsten 14 Tagen kommt", so Betz.

Bisher seien nach Baden-Württemberg nur 290 000 Dosen des Impfstoffes Pandemrix geliefert worden, weiß Betz. Zugesagt hatte der Hersteller Glaxo Smith Kline zum jetzigen Zeitpunkt, zweieinhalb Wochen nach Beginn der Impfkampagne, schon eine Million Portionen.

Das führt zu Engpässen. Michael Vogler, der in Tübingen die Neue Apotheke am Europaplatz betreibt, hat schon vor längerem 500 Impfeinheiten bestellt und wartet bis heute auf die Lieferung. Auf einem Impfportal der Landesapothekenkammer kann er online abfragen, welche Apotheke in der Umgebung Pandemrix auf Lager hat. Demnach war gestern Abend in ganz Tübingen kein Impfstoff zu haben. Erst in Burladingen oder Albstadt wäre Vogler fündig geworden.

"Es läuft alles sehr holperig", weiß auch Michael Datz. Der Tübinger Allgemeinmediziner hat vorgestern die ersten zehn Patienten geimpft. "Es geht ihnen gut", sagt der Präsident der Bezirksärztekammer Südwürttemberg. Nun erwartet er die nächste Lieferung: Impfstoff für 100 Patienten hat er dieses Mal geordert. Die Warteliste seiner Patienten kann er damit in der kommenden Woche abarbeiten. Ob es überhaupt nötig ist, sich impfen zu lassen? Datz weiß es nicht. Er hält das für "eine Entscheidung, die man wissenschaftlich nicht klären kann".

Auch in der Südstadt-Praxis von Wolfgang Raiser soll nächste Woche der erste Impfstoff ankommen. 40 Patienten kann er damit immunisieren. Innerhalb von acht Tagen gab es in Raisers Praxis fünf bestätigte Fälle der Schweinegrippe. Raiser berichtet von "relativ harmlosen" Verläufen. Zwar bekamen die Patienten, darunter auch Kinder, von einem Tag auf den anderen hohes Fieber und litten dazu unter Glieder- und Kopfschmerzen, meist auch unter Husten. Aber nach zwei, drei Tagen sei alles vorbei gewesen, so Raiser. So stellt sich für ihn immer noch die Frage, "ob man die Leute tatsächlich mit einer Impfung schützen muss".

"Es macht schon Sinn, dass man sich impfen lässt", sagt Prof. Klaus Hamprecht, Virologe am Tübinger Uni-Klinikum. Wobei es immer auch auf das individuelle Ansteckungsrisiko ankäme. Die Frage sei zum Beispiel, ob man häufig mit großen Menschenmengen zusammen komme. Derzeit schätzt Hamprecht die Situation jedenfalls "nicht als dramatisch ein". "Im Augenblick gibt es in Tübingen praktisch kein Risiko, sich mit Schweinegrippe anzustecken, wenn man über die Straße geht", sagt der Viren-Experte. "Ich würde das noch mit einer gewissen Gelassenheit sehen." Trotzdem: "Eine rechtzeitige Impfung kann die weitere Ausbreitung des Virus eindämmen."

g "Der lange Weg bis zur Tat"

Eine Extra-Mixtur für jede Spritze

Gesundheitsämter Polizei, Rettungsdienste und Krankenhäuser den beziehen den Impfstoff direkt. Niedergelassene Ärzte müssen über die Apotheken gehen. Die bestellen das Vakzin bei einem Logistikunternehmen in Bruchsal in Gebinden von 500 Portionen. Die kleinste Einheit, die von Apotheken an Arztpraxen abgegeben wird, sind zwei Glasfläschchen, die zehn Impfdosen enthalten. In einer Flasche ist das Antigen, in der anderen der umstrittene Wirkverstärker, das Adjuvans. Geimpft wird mit einer Mixtur, die für jede Injektion zusammenfügt werden muss. Sind die Fläschchen erst einmal geöffnet, müssen sie innerhalb von 24 Stunden aufgebraucht sein.

THE FLU CASE

German media claims swine flu jab scarce to drive up demand

The Flu Case, 5 November 2009 11:49

https://web.archive.org/web/20100102021836/http://theflucase.com/index.php?option=com_content&view=article&id=1616%3Agerman-media-claims-swine-flu-jab-scarce-to-drive-up-demand&catid=1%3Alatest-news&Itemid=64&lang=en

Parts of the German media seem to be implementing the cynical strategy discussed in a recent meeting of the Council of Foreign Relations in New York of giving the impression there is a shortage of the swine flu jab in order to drive up demand.

A headline in Tagblatt today says:

"The swine flu itself doesn't play a big role in the region of Tübringen yet. The excitement about the vaccine is growing - just because it is barely to be had."

There follows a report giving the impression that people are searching high and low for the rare swine flu vaccination in Tübingen.

WELT

Neuer Schweinegrippe-Impfstoff zugelassen.

WELT, 5 November 2009.
https://www.welt.de/gesundheit/article5092451/Neuer-Schweinegrippe-Impfstoff-zugelassen.html

Allgemeinärzte schauen nach Schweden: Dort ist ein Fünftel der Bevölkerung geimpft, und das mit wenigen Nebenwirkungen. Nachdem in Deutschland schon mindestens neun mit der Schweinegrippe infizierte Menschen gestorben sind, ist für die Bundesrepublik ein weiterer Impfstoff zugelassen worden.

Der Berufsverband der Allgemeinärzte in Berlin und Brandenburg rechnet mit deutlich weniger Verunsicherung der Ärzte bei der Impfung gegen die Schweinegrippe. Der Verbandsvorsitzende Hans-Peter Hoffert sagt, es lägen mittlerweile internationale Erfahrungen über die Nebenwirkungen der Impfung vor. Es habe in Schweden, wo bereits mehr als ein Fünftel der Bevölkerung geimpft worden sei, kaum Nebenwirkungen gegeben. Hoffert erwartet deshalb, dass die Impfplanungen in Berlin auch von den Hausärzten von nächster Woche an nun zügig umgesetzt werden.

In Deutschland sind mit Stand vom Mittwochabend mindestens neun mit der Schweinegrippe infizierte Menschen gestorben. In der Hauptstadt hatte es einen ersten Todesfall im Zusammenhang mit der Schweinegrippe gegeben. Ein 40 Jahre alter Mann war mit dem Virus H1N1 infiziert. Ob er auch daran gestorben ist, soll nach Angaben der Gesundheitsverwaltung eine Obduktion ergeben. Der Berliner war am vergangenen Donnerstag mit einer entzündlichen Lungenerkrankung (Pneumonie) im Vivantes Klinikum Am Urban in Berlin-Kreuzberg aufgenommen worden. Zunächst war die Erkrankung normal verlaufen – bis zum überraschenden Tod am Montag. Als Ursache attestierten die Ärzte Herz-Kreislaufversagen. Das positive Ergebnis des Schweinegrippe-Tests wurde erst am Mittwoch zwei Tage nach dem Tod des Mannes bekannt.

In Niedersachsen gibt es mittlerweile große Probleme mit dem Nachschub des Impfstoffes gegen die Schweinegrippe. Viele Patienten, die sich impfen lassen wollen, müssten bei den Arztpraxen auf Wartelisten gesetzt werden, sagte Uwe Köster von der Kassenärztlichen Vereinigung (KVN) in Hannover. "Diese Menschen werden telefonisch informiert, wenn sie an der Reihe sind. Das kann auch mehrere Wochen dauern." Innerhalb weniger Tage habe sich die Einstellung zur Impfung gegen die Schweinegrippe komplett gedreht.

Neuer Impfstoff zugelassen

Der Pharmakonzern Novartis hat in Deutschland die Zulassung für seinen Impfstoff Celtura gegen die Schweinegrippe erhalten. Die Zulassung des auf Zellkulturbasis produzierten Impfstoffs sei ein wichtiger Meilenstein, um das klassische Verfahren der Impfstoffproduktion mit Hühnereiern abzulösen, teilte Novartis am Donnerstag mit. Nach dem positiven Entscheid der deutschen Behörden will Novartis die Zulassung in anderen wichtigen Ländern vorantreiben.

Eine Prüfung ist unter anderem beim Schweizerischen Heilmittelinstitut Swissmedic im Gang. Klinische Studien an mehr als 1.850 Probanden zeigten laut der Mitteilung die Verträglichkeit und Immunogenität von Celtura. Die Sicherheits- und Verträglichkeitsprofile entsprächen den Erwartungen. Die am häufigsten genannten Nebenwirkungen seien lokale Beschwerden an der

Einstichstelle sowie systemische Beschwerden wie leichtes Fieber, Kopfschmerzen und Müdigkeit gewesen. Bisher seien keine schweren Nebenwirkungen beobachtet worden. Celtura wird im hessischen Marburg hergestellt und ist ein mit einem Wirkungsverstärker ergänzter Impfstoff gegen das Grippevirus A(H1N1). Die Produktion viraler Antigenkomponenten basiert auf einer validierten Zellkulturlinie statt auf dem klassischen Verfahren mit Hühnereiern. Diese Technologie ist in Europa für bereits den saisonalen Grippeimpfstoff Optaflu zugelassen.

Thomaner nach Hause geschickt

Wegen des Verdachts auf Schweinegrippe ist auch das Alumnat des Leipziger Thomanerchors bis zum Mittwoch geschlossen worden. Die 91 zehn- bis 18-jährigen Chorsänger seien vorsorglich nach Hause geschickt worden, sagte Chor-Geschäftsführer Stefan Altner. Zuvor hätten sich 30 Kinder mit grippalen Infekten gemeldet, zudem habe sich bei einem Elfjährigen der Verdacht auf das H1N1-Virus bestätigt.

Die Thomaner besuchen damit vorläufig auch nicht die Thomasschule, an der insgesamt 640 Schüler lernen. Die Schulleitung hatte den Eltern wegen der erhöhten Krankheitsrate empfohlen, ihre Kinder am Donnerstag und Freitag zu Hause zu behalten.

Schweinegrippe erreicht Yanomami-Indianer

Die Schweinegrippe hat nach Angaben von Ärzten eines der größten im Amazonas lebenden indigenen Völker, die Yanomami-Indianer, erreicht. In Dörfern an der venezolanisch-brasilianischen Grenze sei eine 35-jährige schwangere Frau an der Viruserkrankung gestorben. Zudem besteht der Verdacht, dass sechs Kleinkinder an der Krankheit gestorben seien. Sie hätten Symptome der Schweinegrippe gezeigt. Es seien bei ihnen nicht rechtzeitig Proben unternommen worden, mit denen das H1N1-Virus nachgewiesen hätte werden können, sagte der Arzt.

Der venezolanische Präsident Hugo Chavez bestätigte, dass die Schweinegrippe "die indigene Gemeinschaft" erreicht habe. Die Lage sei unter Kontrolle, fügte er hinzu.

Celtura given surprise approval in Germany

The Flu Case, 5 November 2009, 11:30
https://web.archive.org/web/20100102054037/http://theflucase.com/index.php?option=com_content&view=article&id=1615%3Aceltura-given-surprise-approval-in-germany&catid=1%3Alatest-news&Itemid=64&lang=en

The German drug regulators, the Paul Ehrlich Institute, have approved Celtura, the swine flu jab manufactured by Novartis.

The approval will come as a surprise as it comes shortly after the Swiss drug regulators, Swissmedic, said they had put approval of the drug on ice because of a lack of safety data and because bacterial contamination had been found in Celtura vaccine material.

Novartis maintains a press release that clinical studies conducted with more than 1,850 subjects have evaluated Celtura's tolerability and immunogenicity.

However, a quick search on Google Scholar using the key word "Celtura" turned up few results indicating any clinical trials have been performed.
http://scholar.google.at/scholar?q=celtura&hl=de&btnG=Suche&lr=

Celtura appears to be the repackaged form of Aflunov/Fluad H5N1, which had to be withdrawn from the European Market apparently because it killed at least 20 people during clinical trials in Poland in 2008.

100 health workers repeat H1N1 shot

CBC News, 5 November 2009, 10:20 AM ET
https://web.archive.org/web/20091106115924/http://www.cbc.ca/canada/montreal/story/2009/11/05/montreal-h1n1-shots.html

About 100 Montreal health-care workers had to get another H1N1 flu shot because the previously administered ones were improperly mixed.

One nurse at Centre Le Cardinal Inc. in the city's east end told CBC News that on Wednesday, she and others had to be vaccinated a second time this week after a colleague administering the shots realized the dosage was wrong.

French-language television network TVA reported that the vaccine given to workers at the long-term-care facility last Sunday and Monday contained too much of the adjuvant, the substance added to the vaccine to stimulate a stronger immune response.

The centre's director, Sylvie St-Hilaire, said the vaccine contained double the amount of adjuvant normally found in the vaccine.

"These kind of errors do happen. They are not common but they do happen every year, usually with errors in doses," she said.

Dr. Terry-Nan Tannenbaum, chief of health protection at Montreal's Public Health Department, said the H1N1 vaccine requires more steps to prepare it.

"It's a little bit different than what we usually need to do when we prepare vaccines," she said. "They sometimes come completely prepared. Other times the vaccine is in a powder form and you mix it with a liquid called a dilutant. So this is different and more complex."

Public health officials said the people responsible for preparing the vaccine did not understand the guidelines issued by the government, but they added that those receiving the shots were not in danger.

CBC news

H1N1 supplier vaccinating workers' families

CBC News, 5 November 2009, 9:22 PM ET
https://web.archive.org/web/20091107194846/http://www.cbc.ca/canada/montreal/story/2009/11/05/gsk-employees-family-vaccinated.html

The family members of staff working for the only company producing the swine flu vaccine in Canada are being vaccinated ahead of many priority groups, according to a Radio-Canada investigation.

A team with the French-language arm of the CBC visited the GlaxoSmithKline facility in Quebec City to check on security measures Thursday — only to discover that the company was welcoming employees and their family members for a vaccination clinic.

"It is a sort of privilege that we have for the families," said mechanic Patrick Cayouette, who was leaving the clinic with his sister, Marie-Pier. Cayouette said the two do not live together.
"I would have had to wait until Nov. 15 to get vaccinated," said Marie Pier Cayouette. "But here, I had the chance to get vaccinated ahead of a lot of other people … even before the order of priorities."

Quebec's chief public health officer, Dr. Alain Poirier, said there should be no preferential treatment.

"Has there been any? Probably. But none has been authorized by the Health Ministry," said Poirier.
Poirier said he himself is still waiting his turn to get the vaccine.

Wednesday evening, even GlaxoSmithKline president Paul N. Lucas said he had not been vaccinated yet.
"Because I'm not in the priority groups," Lucas said.

The vaccine targets the strain of H1N1 influenza A virus responsible for the current swine flu pandemic.

Agreement unclear

GlaxoSmithKline said the vaccination of employees' families is permitted thanks to an agreement with public health authorities in Quebec and Ontario as well as with Health Canada.

But Quebec Health Minister Yves Bolduc seemed unaware of the situation. "Generally, we vaccinate the workers. … We recommend not to vaccinate the family and to go according to priority groups," Bolduc said.

After initially saying the agreement only applied to employees at GlaxoSmithKline, a spokesperson for Health Canada later confirmed it also covers members of their immediate family.

The doses come from the province's supply of the vaccine, said Health Canada.

Canada's chief public health officer, Dr. David Butler-Jones, has defended Canada's decision to have only one company supply the vaccine, saying the priority was to have a supplier in Canada that could provide sufficient vaccines for the entire country.

He said GlaxoSmithKline, which won the call for tender, was the only company that could produce enough of the vaccine.

As a result, Butler-Jones said Canada has more guaranteed vaccines than anywhere else in the world.

All schoolchildren may be vaccinated against swine flu

The Guardian, 5 November 2009, 20.30 GMT
http://www.guardian.co.uk/world/2009/nov/05/swine-flu-vaccine-for-schoolchildren

Swine flu vaccine: All schoolchildren may get vaccinated as government considers extending vaccination programme. Photograph: John Amis/AP

All healthy schoolchildren may be vaccinated against swine flu, the Department of Health revealed today, as it issued guidance on how to help pregnant women who catch the infection.

Confirmation that the government is considering extending the vaccination programme came as the Conservatives called for all pupils to be immunised against the H1N1 virus.

Cases of the disease in England increased only marginally this week to 84,000, according to official estimates. The latest figures show 154 people have died from swine flu – 105 in England, eight in Wales, 31 in Scotland and 10 in Northern Ireland. Seventeen people have died in the UK in the past week.

The chief medical officer, Sir Liam Donaldson, confirmed the government's Joint Committee on Vaccination and Immunisation is examining whether to extend the vaccination programme.

Healthy children are not among the priority groups in the first round of vaccinations. "We would hope to take a decision on [inoculating them] in the next few weeks," he said. "We are looking very hard at the next steps. We will have to work out whether any groups in the healthy population will have to be prioritised."

The Tory health spokesman, Andrew Lansley, proposed a universal schools vaccination programme. "For weeks now, behind the scenes," he said, "I have urged the government to go further: they should extend the vaccination programme to schoolchildren and college students.

"Last week in America I met swine flu experts at the Health and Human Services Department. Their data shows the incidence and severity of swine flu is significantly greater in the under-24 age group, compared to the rest of the healthy population. They have called all young people for vaccination, including a school-located vaccination programme. I think we should follow their lead."

The Department of Health said the US had so far left it up to individual states to determine what they believed were the priority groups deserving protection.

Its new advice to help doctors recognise serious symptoms in pregnant women has been released, suggesting those with high heart rates or shortness of breath when first infected are most at risk of serious illness or death.

CBC news

Ask military to help with H1N1: Ottawa councillor

CBC News, 6 November 2004
https://web.archive.org/web/20091109102849/http://www.cbc.ca/canada/ottawa/story/2009/11/06/dnd-swineflu.html

Coun. Bob Monette believes doctors and nurses from the Armed Forces could be deployed in cities to help with H1N1 vaccinations. (CBC)

An Ottawa city councillor wants to call in the Armed Forces to help conduct swine flu vaccinations.

Coun. Bob Monette said Thursday he has written to federal Health Minister Leona Aglukkaq asking if doctors, nurses and medics from the Canadian Forces could be deployed in cities across Canada to help with the H1N1 vaccinations.

Monette said the idea came to him after speaking with a constituent who's a member of the Forces.

"Why not think of all the possibilities?" Monette said.

"This was one more possibility that I found was worthwhile looking into, and let's see if anything comes from it. If we can get one or two doctors, a nurse, to help out, then it's worthwhile," he said.

Ottawa-Orleans MP Royal Galipeau has endorsed Monette's idea. He said he's also written to the health minister and to the minister of defence.

Baxter, Novartis and GSK filed patents for "swine flu" jab in 2008 and 2006

The Flu Case, 6 November 2009
https://web.archive.org/web/20091111132758/http://theflucase.com/index.php?option=com_content&view=article&id=1668:baxter-novartis-and-gsk-filed-patents-for-qswine-fluq-jab-in-2008-and-2006&catid=1:latest-news&Itemid=64&lang=en

According to WHO, the "swine flu" H1N1 virus is so new that it counts as a deadly threat to us and a pandemic level 6 declaration is justified.

However, three of the major pharmaceutical companies that sat as "observers" on WHO's vaccine advisory board which recommended their "swine flu" jabs to fight the swine flu "pandemic" in July filed patents for a "swine flu" vaccine long before the virus appeared allegedly for the first time in Mexico in April 2009.

Baxter, Novartis and GlaxoSmithKline filed patents in 2008 and 2006.

The present invention provides a method for the manufacture of a preparation comprising virus antigens comprising a) inoculation of cells with infectious virus in a fluid,
b) propagation of said virus in said cells,
c) collecting said propagated virus,
d) inactivating said collected virus, and
e) treating said inactivated virus with a detergent, resulting in a preparation comprising viral antigens.

(57) **ABSTRACT**

The invention seeks to avoid components in split vaccines that could cause an excessive Th2 response. Thus the invention provides an immunogenic composition comprising a split influenza virus antigen and a Th1 adjuvant, wherein the antigen is preferably prepared from a virus grown in cell culture (e.g., it is free from egg proteins).

French department drops mobile pandemic vaccination teams for schools

The Flu Case, 7 November 2009, 10:15
https://web.archive.org/web/20100102033249/http://theflucase.com/index.php?option=com_content&view=article&id=1677%3Afrench-department-drops-mobile-pandemic-vaccination-teams-for-schools&catid=1%3Alatest-news&Itemid=64&lang=en

The French department of Vauclause has dropped plans for mobile pandemic vaccination teams to visit children at schools to give them the "swine flu" jab, it has been announced. Parents who want their kids to have swine flu vaccines will have to go to a higher education establishments.

"Changement dans le plan départemental de vaccination contre la grippe A, H1N1.

Dans le département du Vaucluse, il n'y aura pas d'équipes mobiles passant dans les établissements scolaires, contrairement à ce qui était prévu. Dans notre circonscription,un collège servira de centre de vaccination.

Les parents qui souhaiteront faire vacciner leur enfant devront l'y emmener.
Enfin une décision de bon sens. (source hiérarchie éducation nationale)," emails Sylvie.

THE FLU CASE

Need for special needles delays vaccination campaign in Norway

The Flu Case, 8 November 2009

https://web.archive.org/web/20100102042627/http://theflucase.com/index.php?option=com_content&view=article&id=1698%3Aneed-for-special-needles-delays-vaccination-campaign-in-norway&catid=1%3Alatest-news&Itemid=64&lang=en

In Norway, the swine flu vaccination campaign was delayed because the hospitals had to wait for special needles and syringes. It has been suggested that special government supplied needles are to be used because these will contain a nano chip. A bar code on the syringe package would allow traceability, for example.

Also, all of the big pharma companies are reported to have contracts for RFID chips with Verichip.

2009 H1N1 Influenza Vaccine Ancillary Supply Kits

CDC, 26 October 2009 (updated)

https://web.archive.org/web/20100103113543/http://www.health.state.nm.us/H1N1/documents/2009_H1N1_Influenza_Vaccine_Ancillary_Kit_Description_102609_v1.7.pdf

CDC

2009 H1N1 INFLUENZA VACCINE ANCILLARY SUPPLY KITS
Overview

DRAFT

Purpose

This document provides an overview of the different needles and syringes that are included in the 2009 H1N1 influenza vaccine ancillary supply kits. Manufacturers' website and contact information have also been included as an additional training resource.

Target Audience

State and local health department staff, health care personnel, and others responsible for training vaccinators or administering the H1N1 influenza vaccine.

General Information

The federal government is providing ancillary supply kits for the administration of injectable 2009 H1N1 influenza vaccine. Ancillary supply kits are not necessary for the administration of live attenuated influenza vaccine (LAIV) nasal spray. In order to meet the demand for supplies, the federal government has purchased FDA approved, NIOSH compliant safety engineered, single use, sterile needles and syringes from multiple manufacturers.

There are three types of ancillary supply kits:

1. Multi-dose vial kits (to be used with multi-dose vials)
2. Pediatric prefilled syringe kits (to be used with 0.25 mL prefilled syringes)
3. Adult prefilled syringe kits (to be used with 0.5 mL prefilled syringes)

Ancillary kits received directly from McKesson contain quantities of 100 each of needles/syringes, alcohol prep pads, and vaccination records. Some ancillary supply kits may contain 10 needles/syringes for mixing vaccine adjuvant.

These were included for contingency planning but since 2009 H1N1 influenza vaccine will not be used with adjuvant, these **mixing needles/syringes should not be used to administer vaccines.** Additional information related to training and use of the needles and syringes included in the ancillary supply kits can be found on the manufacturers' websites.

В России начинается первый этап вакцинации против нового гриппа

News.ru, 9 ноября 2009
https://www.newsru.com/russia/09nov2009/gripp.html

В России 9 ноября начинается вакцинация против нового гриппа. На первом этапе она пройдет в Алтайском крае, Московской, Тюменской, Брянской и Воронежской областях. Российские медики рекомендуют параллельно с вакцинацией носить маски и не забывать о витаминах.

Как сообщили в пресс-службе Минздравсоцразвития, на первом этапе вакцинация охватит работников служб жизнеобеспечения (ЖКХ, водоснабжение, электрообеспечение, связь). С конца ноября будут привиты медработники, учителя, студенты старших курсов медвузов. Следующим этапом будет проходить вакцинация остальных категорий населения по группам риска по развитию тяжелых форм заболевания – люди, страдающие хроническими заболеваниями, беременные женщины, дети, передает ИТАР-ТАСС.

Как напомнили в Минздравсоцразвития РФ, в РФ разработаны, проведены через доклинические и клинические испытания и зарегистрированы четыре вакцины, которые во время испытаний показали свою эффективность и полную безопасность.

"Правительство России выделило 4 млрд рублей на закупку первых 43 млн доз вакцины", - отметили в пресс-службе ведомства. С одним из производителей вакцины, в частности, ФГУП "Микроген", уже заключен государственный контракт на поставку первой партии вакцины (1,3 млн доз) против вируса гриппа A/H1N1.

В Минздравсоцразвития РФ разъяснили, что "если человек уже сделал прививку от сезонного гриппа, то ему все равно нужно вакцинироваться от гриппа A/H1N1, так как вакцина против сезонного гриппа включает в себя три других актуальных штамма и не защищает от гриппа, вызываемого вирусом A/H1N1". Эти прививки следует проводить с интервалом минимум один месяц в соответствии с инструкциями по применению вакцин.

Медики рекомендуют параллельно с вакцинацией носить маски и не забывать о витаминах

Вакцинация остается основным профилактическим средством против гриппа, в том числе A/H1N1. Однако россиянам не стоит забывать и о других средствах, которые за многие годы заслужили внимание с точки зрения профилактики вирусных заболеваний. Как отмечают в Минздравсоцразвития РФ, это относится, в частности, к ношению масок и приему витаминов, причем не только в форме медикаментозных препаратов, но и фруктов и овощей.

Особенно детям рекомендованы также ингаляции с эфирными маслами. "Если ребенок был инфицирован в транспорте, у него есть еще 4-6 часов до того, как вирус начнет хозяйничать в организме", - таково мнение директора НИИ гриппа профессора Олега

Киселева. По его словам, "даже если под рукой нет лекарств, то очень хорошо поможет ингаляция с пихтовым или сосновым маслом".

Роспотребнадзор рекомендует во время подъема эпидзаболеваемости по возможности не посещать массовые мероприятия.

Российские медики настоятельно рекомендуют ношение в общественных местах медицинских масок. Эксперты с удовлетворением отметили, что такое простое средство профилактики, как маски, не только было поддержано населением, но и в ряде случаев превратилось в определенный модный аксессуар. Например, на недавнем модном показе в Новом Манеже были представлены модели в матерчатых масках стального цвета, дополнявших коллекцию верхней одежды. А на вещевых рынках появились марлевые маски с нарисованными на них мордочками зверьков или просто улыбками. По мнению специалистов, такая мода носит только позитивный характер, так как помогает максимально избежать возможности заражения гриппом.

В Минздравсоцразвития напомнили, что заболеваемость гриппом, в том числе высокопатогенным, находится в России под контролем. По сути заболеваемость высокопатогенным гриппом не имеет серьезных отличий от заболеваемости сезонным гриппом. Как и в прошлые годы, медики рекомендуют при начальных признаках заболевания обращаться к врачу, принимать противовирусные препараты и соблюдать постельный режим.

КОМСОМОЛЬСКАЯ ПРАВДА

Александра Кучук и Анна Кукарцева

Свиной грипп: прививаться будете?

Комсомольская Правда, 9 ноября 2009 18:50
WWW.KP.RU: https://www.kp.ru/daily/24390.5/569216/

Корреспонденты «КП» Александра Кучук и Анна Кукарцева спорят: а надо ли все-таки участвовать в массовой вакцинации. Разумеется, опираясь на статистику и мнения врачей.

В стране началась прививочная кампания от нового гриппа. Пока прививают только в Алтайском крае, Московской, Тюменской, Брянской и Воронежской областях. В первую очередь «обслужат» работников ЖКХ, водоснабжения, электрообеспечения, связи, то есть тех, кто ходит по домам – электриков, сантехников и пр.

По планам Минздрава, с 23 ноября планируется начать вакцинацию медработников, учителей, студентов старших курсов медвузов. А уж потом очередь дойдет и до остальных групп риска: людей с хроническими заболеваниями, беременных и детей.

«ЗА» Александра Кучук: «Не сделаете прививку – ее сделают кому-то другому!»

Вирусологи объясняют: чтобы выработать иммунитет к новому гриппу надо либо им переболеть, либо привиться. Есть три неоспоримых довода, почему стоит выбрать вакцину.

1) Этот вирус уже сейчас встречается гораздо чаще, чем другие гриппы. Эпидсезон в стране длиться примерно 32 недели. Ходить в масках все это время нереально. Да, в большинстве случаев новый грипп протекает легко. НО! Есть указанные Минздравом 6 %, для которых вирус A/H1N1 смертельно опасен. Это беременные, маленькие дети, хронические больные. Их пока не начали прививать. И если сейчас вы не сделаете прививку – где гарантия, что через пару недель, загрипповав-таки, не чихнете случайно на будущую мамулю? Что именно ваш вирус не добьет соседа-астматика, не зацепит вашего ребенка или родственника, недавно перенесшего инфаркт?

2) Статистика последствий гриппа в России далека от совершенства. У нас не считают так называемые «избыточную смертность». То есть заболел человек гриппом, а через три недели умер из-за осложнения на сердце. В причинах смерти «грипп» не укажут стопроцентно. Хотя виноват именно он! Подумайте и о своем здоровье. Прививка – это защита от осложнений.

3) Вакцинация бесплатная. И поэтапная. Желающих полстраны. Не сделаете прививку – ее сделают кому-то другому!

«ПРОТИВ» Анна Кукарцева: «А если ты уже переболел?»

Как известно, любая прививка вызывает ма-а-аленькую, но все же болезнь в организме - чтобы выработался иммунитет. И она совершенно не нужна человеку, уже отболевшему свое. Откуда мы знаем: возможно, большая часть из тех, кому полагается бесплатная вакцина, уже переболели в легкой форме. Ведь как говорит наша любимая ВОЗ, свиной грипп может протекать и в легкой форме, без температуры. Анализы же делают людям, которые заболевают в довольно тяжелой форме. Да и то не всем. Остальным ставят просто диагноз «ОРВИ», чем, собственно и является свиной грипп – острым респираторным вирусным заболеванием.

Вполне возможно, что у многих иммунитет справился сам, выработав защиту против вируса A/H1N1. Стало быть и вакцинация в этом случае не нужна. К тому же, как говорит известный вирусолог, член Российского национального комитета по биоэтике РАН Галина Червонская, для хорошего клинического испытания вакцин необходимо минимум два-три года, а никак не полгода. Именно за это время, то есть с начала шествия свиного гриппа по планете, «обкатали» несколько видов вакцин – как зарубежных, так и наших.

По сути дела, клинические испытания продолжаются и сейчас. Уже на нас. В добровольно -принудительном порядке. И еще – в данный момент прививают живой вакциной. Как объясняла «КП» Галина Червонская, в живой вакцине содержатся ослабленные штаммы вируса, то есть хоть и «подавленные», но вполне жизнеспособные. И если у человека изначально слабый иммунитет, или он более чем-то в скрытой форме, то прививка может вызвать заболевание, причем с осложнением. Важно, чтобы не было аллергии на куриный белок, который содержится в любой противогриппозной вакцине…

Пока прививают только в Алтайском крае, Московской, Тюменской, Брянской и Воронежской областях. В первую очередь «обслужат» работников ЖКХ, водоснабжения, электрообеспечения, связи, то есть тех, кто ходит по домам – электриков, сантехников и пр. По планам Минздрава, с 23 ноября планируется начать вакцинацию медработников, учителей, студентов старших курсов медвузов. А уж потом очередь дойдет и до остальных групп риска: людей с хроническими заболеваниями, беременных и детей.

ВАЖНО! Кому живую вакцину нельзя: - людям с аллергией на куриный белок;

- маленьким детям, особенно с иммунодефицитом;
- кто менее двух недель назад перенес любую инфекцию, включая герпес;
- при обострении хронических заболеваний
- от гипертонии до аллергии;
- тем, кто уже переболел свиным гриппом.

Но даже если нет явных противопоказаний, прежде чем вакцинироваться, проконсультируйтесь с врачом.

TAGESSPIEGEL

Schweinegrippe: Rösler will Impfung verbessern

Tage Spiegel, 9 November 2009, 15:35 Uhr
https://www.tagesspiegel.de/politik/rosler-will-impfung-verbessern-6788869.html

Die Massenimpfung gegen Schweinegrippe läuft vielerorts nur schleppend an. Gesundheitsminister Rösler will nun klären, wo die Schwachstellen im System liegen - und auch mit dem Hersteller des Impfstoffs sprechen.

Berlin - Die Bundesregierung versucht, Sorgen wegen mangelnder Schweinegrippe-Impfstoffmengen zu zerstreuen. "Es war klar, dass der Stoff nicht in einer 50-Millionen-Dosis plötzlich da ist", sagte ein Sprecher des Bundesgesundheitsministeriums am Montag in Berlin. "Es war immer klar, dass es zu Wartezeiten kommen würde. Das ist ganz normal."

In einigen Regionen Deutschlands war der Impfstoff in den vergangenen Tagen bereits ausgegangen. Viele Menschen müssen wochenlang auf einen gewünschten Impftermin warten.

Neuer Impfstoff für Schwangere nicht in Sicht

In einer Telefonkonferenz habe Bundesgesundheitsminister Philipp Rösler mit seinen Länderkollegen am Montag die Lage beraten. Angesichts der in vielen Regionen schleppend anlaufenden Massenimpfung lud Rösler die Landesminister für diesen Mittwoch nach Berlin ein. Erörtert werden soll, was gegen mögliche Schwachstellen in der Versorgung getan werden können. Auch mit dem Hersteller Glaxosmithkline werde Rösler telefonieren.

Für die Auslieferung eines neuen Impfstoffs für Schwangere gebe es noch keinen Termin, sagte der Sprecher. Mit einem Unternehmen seien mittlerweile entsprechende Vertragsverhandlungen intensiviert worden. Die Ständige Impfkommission empfiehlt für Schwangere einen Impfstoff, der nur Virenteile und zudem keine Wirkstoffverstärker enthält. Solch ein Impfstoff ist in Deutschland bisher weder zugelassen noch erhältlich. (sf/dpa)

New German Health Minister provides no jabs without adjuvants in spite of protests

The Flu Case, 10 November 2009, 09:19
https://web.archive.org/web/20100102005849/http://theflucase.com/index.php?option=com_content&view=article&id=1722%3Anew-german-health-minister-provides-no-jabs-without-adjuvants-in-spite-of-protests&catid=1%3Alatest-news&Itemid=64&lang=en

Following protests, key German public health officials were forced to revise their recommendation and stated that a swine flu jab without adjuvants and with only parts of a virus should be given to pregnant women.

However, there is no such swine flu vaccine available on the market for the ordinary population and the German governments new health minister Philip Rösler has failed to get the pharmaceutical companies Novartis and GlaxoSmithKline to deliver one, creating a situation where pregnant women will be forced, in practice, to take the swine flu jab with dangerous adjuvants as Rösler accelerates the mass swine flu jab vaccination programme.

Berliner Morgenpost

Birgit Haas und Tanja Kotlorz

Impfung startet in Berlin mit einem großen Chaos

Berliner Morgenpost, 9 November 2009, 22:35 Uhr
https://www.morgenpost.de/web-wissen/article104870354/Impfung-startet-in-Berlin-mit-einem-grossen-Chaos.html

Der erste Tag der Immunisierung der Berliner hat ein großes Durcheinander gebracht. Ärzte hatten gar keinen oder zu wenig Impfstoff, die Telefone in den rund 200 bisher zugelassenen Praxen standen nicht still, die Wartezimmer waren voll. Wer sich für die Impfung gegen die Schweinegrippe entschlossen hat, muss längere Wartezeiten in Kauf nehmen. Doch der Engpass soll nun beendet sein.

In Berlin gibt es derzeit noch zu wenig Impfstoff gegen die Schweinegrippe. Das sagte Gesundheitssenatorin Katrin Lompscher (Linke) am Dienstag im RBB-Inforadio. Die zugesagten Liefermengen seien bisher überraschend nicht eingehalten worden. Deshalb könne es vorübergehend zu Engpässen kommen. Da sich aber mittlerweile mehr als 400 Arztpraxen zu Impfungen bereit erklärt hätten, gebe es kein Problem mehr bei der flächendeckenden Versorgung. Nachdem zunächst Schlüsselpersonal und dann Risikopersonen von den Amtsärzten geimpft worden seien, sollen die Hausärzte jetzt Freiwillige impfen. Noch am Montag hatte in den Berliner Arztpraxen Verwirrung und ein großes Durcheinander geherrscht. Nicht alle Patienten konnten sich impfen lassen.

Ohne mit der Wimper zu zucken, lässt sich Tina Gloede die Spritze gegen die Schweinegrippe in den linken Oberarm setzen. Die 19-jährige Altenpflegerin sitzt auf einer Behandlungsliege in der Arztpraxis des Charlottenburger Allgemeinmediziners Uwe Michael Bänsch. Vor der Impfung mit Pandemrix hat Bänsch die junge, gesunde Patientin noch nach Allergien und Erkrankungen befragt. "Mir geht es gut, es tut nichts weh", versichert die Brandenburgerin nach der Immunisierung gegen das H1N1-Virus. Gloede war am Montag eine der wenigen, die sich gegen die neue Grippe in einer Berliner Arztpraxis impfen lassen konnte.

Die Senatsverwaltung für Gesundheit hatte am Sonntag zwar eine Liste mit mehr als 200 ambulanten Kassenärzten veröffentlicht, die nun Impf-Verträge mit dem Senat abgeschlossen haben und gegen das H1N1-Virus impfen dürfen. Doch viele dieser Impf-Ärzte hatten am Montag noch gar keinen Impfstoff und konnten somit keine Patienten immunisieren. Die Senatsverwaltung gab an, dass es bei der Auslieferung zu Verzögerungen gekommen sei, weshalb weniger Arztpraxen als angenommen mit den Impfungen beginnen konnten. "Freitag wurden 39 Praxen beliefert, Montag waren es 48", sagte Sprecherin Marie-Luise Dittmar.

So herrschte am ersten Tag der Massenimpfung der Berliner gegen Schweinegrippe in den Arztpraxen der Stadt oftmals großes Chaos und Verunsicherung bei Ärzten und Patienten. Der Charlottenburger Allgemeinarzt Frank Fechteler (49) musste zum Beispiel seine Patienten und die vielen Anrufer noch vertrösten.

Den Impfstoff gegen die neue Grippe bekam Fechteler erst Montagnachmittag. Da das Impfmittel wegen Beachtung der Kühlkette eine Nacht im Kühlschrank bei zwei bis acht Grad Celsius ruhen muss, kann Fechteler die ersten Spitzen gegen die Schweinegrippe erst am heutigen Dienstag setzen.

Ärzte fordern Einigung mit dem Senat

Dennoch klingelte pausenlos das Telefon in der Arztpraxis. Patienten, Gesunde wie chronisch Kranke, riefen an, weil sie sich gegen die Schweinegrippe impfen lassen wollten. "Ja, wir impfen, wenn wir den Impfstoff haben", sagte die Arzthelferin immer wieder. "200 Anrufe hatten wir innerhalb von zwei Stunden am Vormittag wegen der Schweinegrippe", sagte Fechteler.

Für die kommenden zwei Wochen sei er schon ausgebucht. Mehr Patienten könne er zunächst gar nicht impfen. "Wir wollen ja auch die anderen Patienten noch behandeln."

Dem Senat wirft der Mediziner "Verantwortungslosigkeit" vor. Es gebe viel zu wenige Impf-Ärzte. "Man braucht mindestens 2000 Praxen, um die Bevölkerung durchzuimpfen." Fechteler appelliert an den Senat, sich mit der Kassenärztliche Vereinigung doch noch finanziell zu einigen.

Auf den Impfstoff warteten auch andere Mediziner, wie der Wilmersdorfer Internist Konrad Geigenmüller, der Allgemeinarzt Thomas Georgi aus Prenzlauer Berg und der Weddinger Internist Erich Freisleben. Andere, wie der Spandauer Hausarzt Reinhard Koitka, haben immer noch keine Antwort des Senats bekommen. "Ich habe am 29. Oktober meinen Impf-Vertrag an die Behörde geschickt und bis heute keine Zusage bekommen", kritisierte Koitka. Diverse Telefonate seien erfolglos geblieben.

Erst am Montag bekam der Arzt nun ein Fax vom Senat, worin er auflisten sollte, wie viele Kassenpatienten er behandelt. "Wann ich nun endlich gegen die Schweinegrippe impfen kann, weiß ich immer noch nicht", sagte Koitka.

Glück im Chaos hatte die Chirurgin Sabine Just, die in Moabit in der Praxis von Karsten Mülder als Vertretungsärztin impfen konnte. "Wir haben den Impfstoff rechtzeitig bekommen", sagte Just. Die 60 bestellten Dosen seien bereits am Freitag in die Praxis in der Krefelder Straße 7 geliefert worden, deshalb hätten sie um 14 Uhr die erste Impfsprechstunde abhalten können. "Bis 17 Uhr hatten wir 30 Patienten eingeplant", sagte Just. Doch es hätten viel mehr Patienten angerufen, auch solche aus anderen Bezirken oder Menschen, die noch nie in dieser Praxis gewesen seien. Seit Mittag seien die Impfsprechstunden der kommenden anderthalb Wochen ausgebucht.

Impfpass notwendig

Justs erste Patientin war Monika Wittchen. Die 66-jährige Rentnerin ist vorsichtig: "Ich bin sehr grippeanfällig und lasse mich deshalb lieber impfen." Die täglichen Nachrichten über Tote beunruhigten sie, außerdem habe sie Bluthochdruck, deshalb habe ihre Hausärztin, die selbst nicht impft, zur Immunisierung geraten. Sabine Just fragte sie nach Allergien und weiteren Erkrankungen. Da sie keine Allergien gegen Hühnereiweiß, Quecksilber oder sonstige im Impfstoff verwendete Stoffe hat, konnte sie geimpft werden.

Nach dem kurzen Piks von Arzthelferin Anita Lorenz blieb Wittchen noch zehn Minuten in der Praxis. Zur Sicherheit, falls sie Impfreaktionen zeigen sollte. Sie fühlte keinen Schmerz an der Einstichstelle. "Das kommt noch, ein bis zwei Tage schmerzt das immer", wusste sie noch von der Impfung gegen die saisonale Grippe. In drei Wochen bekommt sie die nächste Spritze. Da sie älter als 60 Jahre ist, braucht sie zwei Dosen, um vollständig immunisiert zu sein. Wer geimpft werden wollte, musste seinen Impfpass dabeihaben. Just impfte nicht, ohne ihn gesehen zu haben.

Hochschullehrerin Julia Brehmer ist zwar gesund, doch gegen die Schweinegrippe wollte sie sich trotzdem impfen lassen. "Ich habe täglich mit Studenten aus dem Ausland zu tun und will mich nicht anstecken", sagte die 44-Jährige. Das Risiko, an Schweinegrippe zu erkranken, wollte sie nicht in Kauf nehmen – dann lieber eine Spritze.

Schon kurz nach Beginn der Impfsprechstunde arbeiteten Just und ihre Helferinnen im Akkord. Heute werden sie wohl Überstunden machen müssen, denn "die anderen Patienten müssen ja auch noch behandelt werden." Wie sie das Arbeitspensum in den nächsten Wochen bewältigen sollen, war Just und ihren Kolleginnen noch unklar.

Hier wie in der Charlottenburger Gemeinschaftspraxis von Uwe Michael Bänsch, wollten sich zu viele Patienten gegen das H1N1-Virus impfen lassen. 500 Impfdosen Pandemrix hat Bänsch bei der zentralen Sankt Hubertus Apotheke bestellt; er hoffte, dass sie reichen.

Bänsch behandelte vor allem HIV-Kranke und Chroniker wie Asthmatiker und Diabetiker, die nach Empfehlung der Ständigen Impfkommission zuerst immunisiert werden sollen. Kinder und Schwangere möchte Bänsch lieber nicht impfen und verweist an Kinderärzte, Gynäkologen und die Gesundheitsämter. Für Schwangere sei der Impfstoff Pandemrix nicht geeignet, bei Kindern gebe es noch nicht so viel Erfahrung, sagte er.

Die ersten Ärzte bestellen nach

Auch bei der zentralen Lieferapotheke Sankt Hubertus am Salzufer in Charlottenburg standen die Leitungen nicht still: Per Fax trudelten permanent neue Bestellungen der Ärzte ein, die nach und nach die Impf-Erlaubnis vom Senat erhalten haben. Andere riefen an, weil sie wissen wollten, wann der Impfstoff geliefert wird. "Drei Mitarbeiter sitzen nur am Telefon", sagte Chef Bernd Drevenstedt. Das sei eine enorme Belastung, die die Auslieferung zusätzlich verzögert, meinte er.

Er bittet die Ärzte darum, nur noch schriftlich zu bestellen, lieber zu viel als zu wenig. Denn einige Ärzte wie auch die Moabiter Chirurgin Sabine Just, mussten bereits nachbestellen. Die 60 Dosen, die Just in die Moabiter Praxis bestellt hatte, werden nur bis heute Abend reichen. Doch Drevenstedt möchte doppelten Wege gern vermeiden und den zehn Mitarbeitern, die die Kartons packen, zusätzliche Arbeit ersparen. "Heute fahren wir schon mit drei, ab Mittwoch mit vier Fahrzeugen aus", kündigte Drevenstedt an. Zu weiteren Verzögerungen solle es nicht kommen, heute sollen weitere 105 Arztpraxen beliefert werden.

THE FLU CASE

Blackout: Military Personnel Banned From H1N1 Vaccine Sites
What's Your Reaction?

The Flu Case, 9 November 2009
https://web.archive.org/web/20100102030337/http://theflucase.com/index.php?option=com_content&view=article&id=1712%3Ablackout-military-personnel-banned-from-h1n1-vaccine-sites&catid=1%3Alatest-news&Itemid=64&lang=en

If you want to draw attention to a problem, try hiding it. That's the strategy of several military bases when it comes to the H1N1 vaccine.

Shortly after the Pentagon announced that all Armed Services personnel would soon be facing a mandatory H1N1 vaccination program, I started receiving email from soldiers, airmen, marines and sailors because of a previous story I had written on the anthrax vaccine. Mandatory vaccine programs are a sensitive subject in the military, so it's not a huge surprise that swift and visceral reactions to the program gained speed.

With a vaccine that was so new and little known about it, like many Americans, troops were heading to the web to find answers to their very legitimate questions -- not only for themselves, but for their families who have the option of receiving the vaccine on base. What they found instead is that several websites and blogs with key information asking critical questions had been blocked from their viewing.

Among those that were repeatedly mentioned as blocked sites are the National Vaccine Information Center (NVIC), the site for Gary Matsumoto's book Vaccine-A, and vaccine expert Dr. Meryl Nass. NVIC is a national, non-profit founded in 1980s that, through public education, advocates "vaccine safety and informed consent protections in the mass vaccination system." Matsumoto's site contains a forum in which thousands upon thousands of service members have posted testimonies regarding their experiences with the anthrax vaccine. And Nass is one of the world's foremost experts on vaccines who has testified in front of Congressional committees -- and, I might add, never has had a malpractice suit brought against her.

The Center for Disease Control (CDC), the Food and Drug Administration (FDA), and the Department of Health and Human Services (HHS) sites, however, are all available for military personnel. The official word from governmental agencies is welcome but critics, regardless of whether they were considered experts, are not.

According to the Office of the Assistant Secretary of Defense for Public Affairs, the only blocking of websites Pentagon-wide was in 2007, when a number of heavy-trafficked sites that "used lots of bandwidth" had to be denied to reduce the wear on networks "to ensure they continued to be available for mission requirements."

That turns out not to be entirely accurate.

Some of you may recall the reporting earlier this year when wired.com's Danger Room blog reported that the Pentagon was blocking not only YouTube, but even their own TroopTube.

When TroopTube launched last November, for instance, it was billed as an answer to the bandwidth and security concerns surrounding other video sites. TroopTube "crunches video files into several sizes and automatically plays the one that best suits viewers' Internet connection speeds," the Associated Press reported at the time. And "a Pentagon employee screens each [upload] for taste, copyright violations and national security issues."

Nonetheless, the public affairs office at the Pentagon further instructed me that "anything that may be blocked at the Service or base level should be addressed there -- it's a local issue."

Since I had the most information (and the most complaints) about Wright-Patterson Air Force in Ohio, that's where I directed my questions. After repeated email and phones calls, nearly two weeks later a spokesperson for Wright-Patterson told me that:

The Air Force general policy is all websites are placed into categories based upon their content and intended audience. All unethical categories are blocked as are any sites that are uncategorized. Currently the sites referenced are blocked because they are uncategorized.

A wholly unsatisfactory answer that side-stepped the question, I took this statement to mean that blocking these websites had nothing to do with bandwidth use as in the Pentagon statement and everything to do with the content.

I asked the follow-up question: Since this is a recent decision to block them, why would they not just be categorized rather than being uncategorized? As a result, they would not be blocked for educational purposes of service personnel who have a mandatory H1N1 vaccination program?

Wright-Patterson did not respond to this question.

Making sure that servicemen and servicewomen consent to the vaccine and are informed is apparently not a concern for the Department of Defense. But the message is very clear for one service member who contacted me: "All you need to know is what we're telling you, so shut up and take the vaccine with no questions asked."

Nass, one of the experts whose site has been blocked, points out the real shame in all of this: "It's unfortunate that the service members who are defending our civil rights are not afforded the same consideration."

KAUAITRUTH.COM

Ray Songtree

Aloha and Welcome to Kauaitruth.com

Kauaitruth, November 2009
https://web.archive.org/web/20091106110545/http://www.kauaitruth.com/

"Eventually, Governor Lingle said, the Department of Health and the Hawai'i National Guard would be administering swine flu vaccine to the general public statewide. "It's not just going to be children, or course," she said. "It will be everybody." Oct 14, 2009 *Honolulu Advertiser*.

This website is about truth and responsibility. My name is Ray Songtree.

I've lived on Kauai for 16 years. I and friends have distributed 12,000 No Need Vaccine flyers on Kauai and 6000 in Honolulu, written hundreds of letters, and if you live on Kauai and commute to work, you may see my sign by the side of the road. I hope to get information about oathkeepers.net to most of our police soon. Here you see my three year old daughter and I surfing near the Hanalei Pier. There is no national emergency because of a flu. There is a national emergency because the law of the land is being twisted and subverted.

242 deaths total in six months in Mexico and USA orders 90,000 vaccine centers. Hello? Seasonal flu kills 100/people a day in USA: where is the nightly report on TV????

We are facing a false flag operation in which a harmless flu is being used as an excuse for international, federal, and state emergency declarations.

These laws and agreements set in motion emergency police powers, and some of them are unconstitutional, but have never been tested.

Once we are under martial law, who will be allowed to challenge those laws? And if vaccines are forced on people according to World Health Organization "recommendations", challenging the emergency with injunctions may come too late for many people.

The vaccines have something in them. So much lying by World Health Organization (WHO), Center for Disease Control (CDC) and complicit media and government, tells us this is more than just making money for Big Pharma. There is some reason they would go so far as to create laws years in advance and have military exercises to get these vaccines into us.

Most vaccines contain additives that are known to be dangerous, and in a series of shots, can effect immune system so that a trigger could kill us. Why would this syndicate want to hurt people? Is it for control?

What we do know is that the 'swine' flu was harmless up until now (Nov 1, 09) We know the H1N1 vaccines are untested. We know the CDC has lied continually about the severity of the 'swine flu' and provided WHO and media with false information so that, in combination with a new WHO definition of "pandemic", Level 6 could be declared, triggering a world wide emergency response that will be ongoing indefinitely until flu magically disappears or WHO controllers are jailed.

When a whistle blower discovers a crime, is he or she a 'conspiracy theorist'. Was CBS News delusional when it uncovered CDC lies? (see full article far bottom) Are those who prosecute war crimes and mafia, 'conspiracy theorists'? There is a fire at the door. You can smell the smoke in the strange hourly push for vaccines on TV news. Let's find out what is going on.

After taking a few minutes to read the "Paul Revere email Ten Questions" below, I suggest the reader get very familiar with *theflucase.com* which describes the criminals.... and *oathkeepers.net* which starts to describe the solution. Oathkeepers is the most important and positive development right now in USA in my opinion.

This site is designed as one long page which you scroll down, just as the original campaign email looked. It may make you afraid>mad but the next mood is important.... proactive. This is our transformation from sheeple to people. My angle on investigating the fake swine flu is justice. Others come from a health perspective. There is an excellent health article far far bottom with important scientific testimony and audio is available too. My justice angle comes because I am tired of being lied to. Perhaps you can relate. A FED that refuses to be audited? No WMD in Iraq? Chief counsel of 911 Commission cries foul?

I want justice! For those new to the real flu story, the pieces of the puzzle will come together as you study the links I have given below. You can write to me at wakeuptoagenda@yahoo.com to receive this email below with live links to help awaken more people, so they too can blow the whistle. Truth is going viral! You may also be able to copy and paste the text below into your email program and distribute, but test to see the links are still active... (Catholic Nun/Doctor speaks out, full interview, below that
CBS News exposes CDC disinformation, then Medical testimony far bottom)

There are more Deaths during Seasonal Flu

CDC Centers for Disease Control and Prevention
Your Online Source for Credible Health Information

How many people die from seasonal flu each year in the United States?
https://web.archive.org/web/20091103195808/http://www.cdc.gov/flu/about/disease/us_flu-related_deaths.htm

The number of seasonal influenza-associated (i.e., seasonal flu-related) deaths varies from year to year because flu seasons often fluctuate in length and severity. CDC estimated that about 36,000 people died of seasonal flu-related causes each year, on average, during the 1990s in the United States. This figure includes people dying from complications of seasonal flu. This estimate came from a 2003 study published in the Journal of the American Medical Association (JAMA), which looked at the 1990-91 through the 1998-99 flu seasons [10]. Statistical modeling was used to estimate how many flu-related deaths occurred among people whose underlying cause of death on their death certificate was listed as a respiratory or circulatory disease. During these years, the number of estimated deaths ranged from 17,000 to 52,000.

In 2009, CDC published additional estimates of seasonal flu-related deaths comparing different methods, including the methods used in the 2003 JAMA study. The seasons studied included the 1993-94 through the 2002-03 flu seasons [9]. Results from this study showed that during this time period, 36,171 flu-related deaths occurred per year, on average.

(1) Not Deadly.

Why has Corporate Media not told us that the mild "swine flu" killed relatively few in the Southern Hemispheric cold winter countries in the last six months?

"Disease control experts say the death rate from H1N1 is similar to the death rate from seasonal influenza" – See: D. Thomas. Australia's "worst case scenario" 6,000 H1N1 deaths. – Reuters, July 16, 2009, 10:04 AM; https://www.reuters.com/article/idUSSYD537212

"According to Secretaria de Salud de Mexico, in a country of 105 million people, 70% urban, only 242 people have died in last six months from H1N1 swine flu, again, most with underlying complications" – H1N1 Vaccines, Criminal Intent – Examiner, Oct. 13, 2009. =>
https://web.archive.org/web/20100317115003/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m10d13-H1N1-Vaccines-Criminal-intent-Hawaii-on-chopping-block

(2) Swine Flu Cases Overestimated

Sharyl Attkisson. Swine Flu Cases Overestimated? CBS News Exclusive: Study of state results finds H1N1 not as prevalent as feared. – CBS News, 21 October 2009

https://web.archive.org/web/20091022182003/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

.

(3) Creation of Epidemic:

Why has Corporate Media not emphasized that the nasal spray vaccine contains live H1N1 virus, makes people contagious for up to 21 days, and requires self-quarantine to prevent risk of creating a wave of new flu cases?

We might also ask "Will a surge in nasal flu contagion be used as excuse for mandatory vaccinations under "national emergency protocols?" See: "H1N1 FluMist: The Nasal Spray that Keeps on Giving!" Sherry Tomfeld; See:

https://web.archive.org/web/20091023091136/http://www.associatedcontent.com/article/2205843/h1n1_flumist_the_nasal_spray_that_keeps.html?cat=70

(4) World Health Organization Manipulation:

Why has Corporate Media not told us that WHO changed the definition of 'pandemic' so that from now on, any new flu can trigger 'emergency' agreements in all 193 member nations until that flu disappears?

"The old [WHO] definition was a new virus, which went around quickly, for which you didn't have immunity, and which created a high morbidity and mortality rate. Now the last two have been dropped, and that's how swine flu was categorized as a 'pandemic.'" Tom Jefferson, epidemiologist

See: "A Whole Industry is Waiting for a Pandemic," – Der Spiegel, July 21, 2009
http://www.spiegel.de/international/world/0,1518,637119,00.html

See: M. Teppone, Definition of Pandemic on the WHO website. – Malaysia, July 2023, p. 160. DOI: 10.13140/RG.2.2.11046.29760/1 // https://archive.org/details/definitionof-pandemic

"To state that there is a pandemic when there is no pandemic is completely absurd. There might well be corruption at the highest levels of World Health Organization." – Dr. Annika Dahlqvist, Sweden

See: "Famous Swedish doctor fired because of statements against the 'swine flu' mass vaccination," Aftonbladet, October 14, 2009. =>

https://web.archive.org/web/20091017024514/http://www.aftonbladet.se/nyheter/article5957251.a

"In 2007, WHO adopted a regulation that in case of a 'pandemic,' WHO can legally bind member countries to vaccinate all or part of their population. The governments of these countries would be obliged then to impose fines or other penalties for individuals who refuse to be vaccinated." – Sr. Teresa Forcades i Vila (Nun/Doctor, Italy)

Gaspar Hernández, "A Nun Speaks Out on the H1N1 Pandemic," Iglesia Descalza, October 8, 2009

(5) CDC manipulation of data:

Why has Corporate Media not investigated the Center for Disease Control that counted 40,000 H1N1 cases after first five weeks, in which time they had scared the world, and then reported the count was only 47,000, a full six weeks later?

See: Sharyl Attkisson. Swine Flu Cases Overestimated? CBS News Exclusive: Study of state results finds H1N1 not as prevalent as feared. – CBS News, 21 October 2009

https://web.archive.org/web/20091022182003/http://www.cbsnews.com/stories/2009/10/21/cbsnews_investigates/main5404829.shtml

In rapid reaction to this news, President Obama declared national emergency based on the false data of CDC saying 1000 H1N1 USA deaths. I find it impossible that Homeland Security and Obama did not hear about CBS article which debunks CDC, so we again have another suspect in the great crime.

The article is particularly damning because it documents CDC's extreme reluctance to hand over data. Just to show how corrupt corporate media is, The New York times published front page articles using the debunked CDC statistics five days after this CBS Oct 21 news! New York Times lies were also given to Senior Citizens like my mom, in September by Hawaii Health Department.

(6) Danger of aspirin with vaccines:

Why has Corporate Media not emphasized that taking aspirin for H1N1 flu or after the nasal mist can be deadly?

See: "Why Isn't CDC Better Warning That Aspirin for 'Swine Flu' Can Kill?". – Examiner, 2 October 2009 [a link to a story has been corrupted - 404 Page not found].

(7) FDA broke safety protocols:

Why has Corporate Media not investigated the FDA and WHO World Health Organization for rushing tests and allowing vaccine manufacturers to test their own products with no independent testing? (We have no idea what is actually in the vaccines)

See: "Lawsuit Against FDA for Failed H1N1 Vaccine Safety Test. – Examiner, 9 October 2009. [a link to a story has been corrupted - 404 Page not found].

(8) Biased interviews:

Why does Corporate Media repeatedly interview nice looking young female employees who unconditionally promote vaccines; rarely interviewing independent and well known experts exposing dangerous additives such as squalene, aluminum, formaldehyde, thimerosal (mercury), IL-2, MF59, Benzethonium chloride, Ethylene glycol, and other toxic adjuvants?

See: Deborah Dupre, "Squalene laced H1N1 vaccination 'pharmacological warfare'." – Examainer Aug 18, 2009 [a link to a story has been corrupted - 404 Page not found].

(9) Illogical mandatory agenda:

Why has Corporate Media not repeatedly emphasized the common-sense points that:

a) Non-vaccinated people are no threat to vaccinated people?

b) Those getting flu shots still get mild flu anyway and will still be contagious?

c) Any new panic version of H1N1 means virus mutation, thereby making all present H1N1 vaccines obsolete?

Please remember this. If flu doesn't act like it did in Australia and New Zealand and Mexico, then it is not H1N1 but something new.

Representative Dr Ron Paul on H1N1

(10) PREMEDITATED MARTIAL LAW:

Why has Corporate Media not investigated who is organizing premeditated martial law simultaneously here and abroad, and training of troops "to assist" with a harmless flu?

See: "Swine Flu: Path to Martial Law?" John Griffing, Pakalert Press, September 10, 2009. https://web.archive.org/web/20091026091318/http://pakalert.wordpress.com/2009/09/10/swine-flu-path-to-martial-law/

See: "Martial Law and the Militarization of Public Health: The Worldwide H1N1 Vaccination Program," Michel Chossudovsky, Global Research, 26 July 2009. https://web.archive.org/web/20090728103106/http://www.globalresearch.ca/index.php?context=va&aid=14543

See: Kurt Nimmo. "Obama's H1N1 Emergency Declaration: Is Martial Law Unfolding?" Infowars, 24 October 2009. https://web.archive.org/web/20091027010722/http:/www.infowars.com/obamas-h1n1-emergency-declaration-is-martial-law-unfolding/

ÖSTERREICH

H1N1-Impfstoff für Österreich: Geheimer Vorvertrag - 95 Millionen Euro

ÖSTERREICH, 10 Novembre 2009.
http://www.dasjournal.net/news/287/ARTICLE/24759/2009-11-11.html (deleted)

Baxter gewährt Gesundheitsministerium 9 % Rabatt

Details des vertraulichen Vorvertrages des Gesundheitsministeriums mit dem Pharmakonzern Baxter über 16 Millionen Celvapan-Impfdosen zur H1N1-Grippe liegen der Tageszeitung Österreich vor.

Noch im Juli dieses Jahres verwies SP-Gesundheitsminister Alois Stöger in einer parlamentarischen Anfrage diesbezüglich auf eine "Geheimhaltungsklausel".

16 Millionen Impfdosen

Der Vorvertrag mit Baxter hat laut Informationen der Tageszeitung ÖSTERREICH einen Wert von exakt 95 Millionen Euro. Das Ministerium konnte neun Prozent Rabatt herausschlagen. Die Gesamtkosten von 6,55 Euro pro Impfdose bei 16 Millionen Stück würden sonst 104,8 Mio. Euro betragen.

500.000 Dosen Celvapan wurden von Baxter bereits ausgeliefert. Das entspricht einem Wert von rund drei Millionen Euro.

Pilz kritisiert Geheimhaltung

Der Grün-Abgeordnete Peter Pilz kritisiert gegenüber ÖSTERREICH die Verschwiegenheit des Ministeriums bei der parlamentarischen Anfrage. "Beim Eurofighter wurde bestätigt, dass ein privatwirtschaftlicher Vertrag nicht der Geheimhaltung unterliegt. Was das Ministerium macht, verstößt nach Ansicht renommierter Juristen wie Heinz Mayer gegen die Verfassung."

THE FLU CASE

Secret agreement with Baxter violates Austrian Constitution

The Flu Case, 23 November 2009 13:28
https://web.archive.org/web/20100102015641/http://theflucase.com/index.php?option=com_content&view=article&id=2031%3Asecret-agreement-with-baxter-violates-austrian-constitution-&catid=1%3Alatest-news&Itemid=64&lang=en

The Austrian government's secret contract with Baxter to supply swine flu (and bird flu) jabs violates the Constitution, according to legal expert Heinz Mayer, reports dasjournal.net.
The Austrian government is to shell out 95 million euros for 16 million doses of the swine flu jab after receiving a "9%" discount.
Costing 6.55 euros a dose, the Austrian government has to pay far less than the French government for the same jab.
It emerged that the French government is paying over 10 euros for each Baxter jab after the secret agreement with Baxter was published under pressure.
Germany's secret agreements with GlaxoSmithKline have also come under fire.

THE IRISH TIMES

Eithne Donnellan, Michelle Mcdonagh

HSE to offer under-fives swine flu vaccine

Irish Times, 10 November 2009
https://web.archive.org/web/20100102022205/http://theflucase.com/index.php?option=com_content&view=article&id=1716%3Airish-children-to-be-given-untested-swine-flu-jab-by-big-pharma-allies-in-government&catid=1%3Alatest-news&Itemid=64&lang=en

Children Under five years and those aged 65 and over are to be offered the swine flu vaccine later this month and early next month, the HSE confirmed yesterday. They will be offered the vaccine at special HSE clinics across the State, not at GP surgeries.

The HSE, which, along with many GPs, is now vaccinating at-risk groups aged six months to 65 years as well as pregnant women, will begin writing to parents of children aged from six months to under five years this week to inform them of the development.

The letters will tell parents when to bring their child to a HSE clinic for their vaccine. Some will be given actual appointments, others will be told to book an appointment online or by telephone at their nearest HSE swine vaccination clinic.

"Parents of children in this group will begin to receive letters starting this week and throughout November and early December," the HSE said.

"People aged 65 and over will begin to be invited over the coming fortnight."

Those aged over 65 were not included in the initial phase of swine flu vaccinations as they are believed to have some immunity to the H1N1 virus. Most of those hospitalised with the virus to date have been younger people.

Dr Brenda Corcoran of the HSE national immunisation office said after the under-fives and over-65s are vaccinated, the HSE will then move on to vaccinate older children in schools.

In relation to the under-fives and over-65s, she said: "We would ask people in these groups to be patient and to wait for their invitation to arrive. Everyone in these groups will be offered the vaccine throughout November and December."

Letters will first go out to people in areas where there is capacity in existing HSE swine flu vaccination clinics.

Dr Kevin Kelleher, head of health protection with the HSE, said there were now about 600,000 doses of the swine flu vaccine in the State and more were arriving all the time. The first supplies were prioritised for the 400,000 or so at-risk patients aged six months to 65 years in the State. The next priority group is the 300,000 or so under-fives and then the 500,000 over-65s in the State.

He said the HSE would move into schools towards the end of November to vaccinate the 800,000-900,000 older children there.

Dr Kelleher said vaccines had also been distributed to hospitals, so at-risk patients could be vaccinated opportunistically. Healthcare workers in hospitals would also start getting the vaccine this week, he said.

Meanwhile, Dr Mary Horgan, consultant in infectious disease at Cork University Hospital, has warned that swine flu could mix with seasonal flu and create a new virus.

"If a person gets swine flu and seasonal flu together, the two viruses can reassort or get mixed up and we will get another novel virus which will require another vaccine. It's too early to tell yet if this will happen because we're not seeing much seasonal flu yet," she said.

Dr Horgan stressed the need for people who usually get the annual seasonal flu vaccination to make sure they get their jab this year to avoid this situation arising.

Some 3 per cent of the population – about 138,000 people – had contracted swine flu by last week and 14 people had died from the virus. An update on current infection rates will be provided by the Department of Health on Thursday.

GPs to get bigger bonuses if they meet swine flu jab targets

The Flu Case // Daily Mail, 10 November 2009
[this text is from The Flu Case, 10 November 2009]
https://web.archive.org/web/20100102045349/http://theflucase.com/index.php?option=com_content&view=article&id=1725%3Agps-to-get-bigger-bonuses-if-they-meet-swine-flu-jab-targets-reports-daily-mail&catid=1%3Alatest-news&Itemid=64&lang=en

GPs are in line for huge bonuses if they manage to persuade large numbers of their patients to sign up to the swine flu jab, it has emerged.

NHS managers in Birmingham have told family doctors they will be able to get extra payments - on top of the £5.25 they already get per jab - if they meet targets on vaccination rates.

If they vaccinate more than 90 per cent of those deemed at risk of the disease in their area, they will get 50 per cent more per jab, meaning they will be paid £7.88 for every person they vaccinate.

Even if they achieve an uptake of 40 per cent, they will get an extra 10 per cent on top. It is not known if these extra bonuses, which would be worth thousands of pounds per practice, are available in other areas of the country.

Last night critics expressed outrage that doctors were getting yet more money for effectively pushing drugs on to patients.

Family doctors have seen their pay soar since the introduction of a new contract.

Latest figures show their salary is now more than £106,000 on average - 47 per cent higher than the £72,000 they earned in 2002/03, according to the Department of Health.

The original announcement in the summer that GPs were to be paid per jab was greeted with incredulity, with opponents saying they should not get extra money for doing their job.

Doctors have insisted all the money will go towards overtime and the extra staff needed to carry out the vaccinations.

Now Pulse magazine has reported that the Heart of Birmingham primary care trust is so worried about a second wave of swine flu over the winter that it has offered practices up to 50 per cent over and above the £5.25 they get per jab.

Vaccinations are initially being offered to pregnant women and patients with underlying health problems such as asthma and diabetes.

A spokesman for the PCT said: 'In recognition of the additional workload, the PCT will pay a high-coverage bonus.'

Dr Robert Morley, a GP and executive secretary of Birmingham local medical committee, told Pulse the extra payments were 'welcome'.

He said: 'We are asking every practice to give us information about the burden of work so that we can arrange payment if necessary.'

Norman Lamb, Liberal Democrat health spokesman, said: 'It is hard to justify yet more payments to GPs. There is already an agreed payment which means that substantial amounts of money will flow to GPs.

'This agreement works on the assumption that GPs aren't motivated by what is best for their patients.

'The danger is that swine flu will become a massive money-spinner from drugs companies.'

Jackie Fletcher, of vaccination support group Jabs, said: 'There are huge questions about the integrity of vaccine decisions if doctors are paid to give them.

'All vaccines carry a risk of side effects. Can we be confident GPs will tell patients about these risks if they are being paid extra to ensure a high uptake?

'Rather than paying bonuses, the Department of Health should be investigating possible side effects.'

Meanwhile, the true scale of the impact of swine flu on the working-age population has been revealed for the first time.

Figures from the NHS Information Centre show that almost a half of all the people who were admitted to hospital after catching the disease over the summer were aged between 17 and 59.

They show that a bigger second wave of swine flu could have a devastating impact on the economy - and could put the NHS under severe pressure.

The impact of swine flu in the summer months meant the number of bed days spent in hospital by flu patients increased from 207 in July 2008 to 3,976 in July 2009.

An estimated 100,000 new cases of swine flu were occurring per week at the peak of the pandemic in July. Last week, an estimated 84,000 new cases of the virus were reported and experts are predicting another spike in the winter months.

The figures also show that the proportion of people in different age groups needing hospital stays also changed because of swine flu.

In the three months to the end of July 2008, those in working-age groups represented just 19 per cent of all bed days - but this rose to 46 per cent for the same months in 2009.

MailOnline

GPs to get bigger bonuses if they meet swine flu jab targets

Daily Mail, 11 November 2009, 08:15 BST,
[this text is from The Daily Mail, 11 November 2009]
https://www.dailymail.co.uk/health/article-1226704/GPs-bigger-bonuses-meet-swine-flu-jab-targets.html

Doctors are in line for huge bonuses if large numbers of their patients sign up for swine flu jabs.

Managers at a major health trust are offering extra payments on top of the £5.25 that GPs already get per injection.

If they vaccinate more than 90 per cent of those deemed at risk of the disease in their area, they will get 50 per cent more per jab - £7.88 per person.

An uptake of just 40 per cent will earn doctors an extra 10 per cent.

The extra payments are being offered by Heart of Birmingham primary care trust, according to Pulse magazine.

It is not known whether the bonuses, which would be worth thousands of pounds per practice, are available elsewhere in the country.

Last night, critics expressed outrage that GPs were getting yet more money for effectively pushing drugs on to their patients.

They said medics should not be given extra rewards simply for doing their jobs.

Doctors insist the money will go towards overtime and the extra staff needed to give the jabs.

Yet GPs have seen their pay soar since the introduction of new contracts. The average salary is now more than £106,000 - 47 per cent higher than the £72,000 they earned in 2002/03, according to the Department of Health.

Pulse reports that officials in Birmingham are worried about a second wave of swine flu over the winter.

Vaccinations are initially being offered to pregnant women and patients with underlying health problems such as asthma and diabetes.

Norman Lamb, Liberal Democrat health spokesman, said: 'It is hard to justify yet more payments to GPs. There is already an agreed payment which means that substantial amounts of money will flow to GPs.

'This agreement works on the assumption that GPs aren't motivated by what is best for their patients.

'The danger is that swine flu will become a massive money-spinner for drugs companies.'

Jackie Fletcher, of vaccination support group Jabs, said: 'There are huge questions about the integrity of vaccine decisions if doctors are paid to give them.'

A spokesman for the trust said Birmingham had been badly hit by swine flu over the summer and the bonus scheme was a carefully-considered response.

The scale of the impact of swine flu on the working-age population is starting to emerge.

Figures from the NHS Information Centre show that almost a half of all those admitted to hospital after catching the disease over the summer were aged between 17 and 59.

The figures are surprising because flu usually affects the young and the old.

They show that a bigger second wave of the illness could have a devastating impact on the economy, and could put the NHS under severe pressure.

The number of bed days spent in hospital by flu patients soared from 207 in July 2008 to 3,976 in July 2009.

Last week, an estimated 84,000 new cases of the virus were reported and experts are predicting a spike over the winter months. In July the figure stood at 100,000 a week.

Clinics and GPs give pandemic vaccine to 250,000

Irish Independent, 11 November 2009, 13:00
https://www.independent.ie/irish-news/clinics-and-gps-give-pandemic-vaccine-to-250000/26581378.html

More than a quarter of a million people had now received the swine flu vaccine, either through their GP or clinic, the HSE said yesterday.

A spokeswoman said more than 200,000 doses had been distributed to GPs over the past weeks and most of these had been administered to patients.

Over 30,000 other people had been vaccinated in the HSE- run clinics around the country, the spokeswoman added.

The initial round of the vaccination campaign, aimed at over 400,000 people with at-risk medical conditions and pregnant women, is now in its second week and further supplies are being distributed.

The spokeswoman said that parents of the first group of healthy children aged under five years old would receive an invitation at the end of this week to get the vaccine in clinics, but this would be rolled out on a phased basis.

Children

She said details of vaccination for schools, aimed at children of all ages, were being finalised and would be announced in the coming weeks.

"The schools programme has been identified as one the next phases of the vaccination campaign over the coming weeks," the spokeswoman said.

Latest reports show that the majority of outbreaks so far have happened in educational settings like schools and colleges. Over 2,000 youngsters fell ill in these settings .

The rate of hospitalisation has so far been highest among under-fours, followed by five- to nine-year-olds and 15- to 19-year-olds. Other outbreaks occurred in residential institutions, creches and the workplace, while two were travel-related and another two happened at social gatherings.

Virus

The south, south-east and mid-west of the country appeared to have fared best so far, with a relatively low number of people falling ill with the virus .

The east, west and north-west have had higher numbers of people suffering from swine flu and it was mild in the majority of cases.

Glaxosmithkline, makers of the swine flu vaccine Pandemrix, quoted results from a clinical trial carried out on 168 adults .

The trial, which involved giving them the Pandemrix and seasonal flu vaccine, found a strong response in adults to both.

A spokeswoman said local reactions such as pain, redness, and swelling at the site of injection were observed in the patients.

Vaccination obligatoire recommandée

La Route Ouverte, 10 November 2009
http://www.teteslibres.com/larouteouverte/2009/11/10/vaccination-recommandee/

Alors que nous demandions depuis des semaines si nous allions devoir être vaccinées, où quand et comment, et après avoir harcelé tous les professeurs du département avec nos questions à ce sujet, nous avons fini par recevoir un courriel de la « responsable des stages ». Je vous le copie ici:

Chers étudiants,
L'objet de ce message vise à clarifier la démarche à suivre en lien avec l'acceptation ou le refus de se faire vacciner. Comme vous le savez sans doute déjà, les employés du secteur de la santé de même que les stagiaires ont été appelés à se faire vacciner pour la grippe A(H1N1) afin d'assurer la protection de la clientèle vulnérable et du personnel de la santé que l'exercice de nos fonctions nous amènent à côtoyer. Cette opération de grande envergure est alors en cours depuis un peu plus d'une semaine et cela sous-entend que l'invitation à cette campagne de vaccination s'adresse à nous tous et que les enseignants, chargés de cours ou étudiants devraient normalement se soumettre à cette exigence en se faisant vacciner dans les prochains jours si ce n'est pas déjà fait. Il est bien évident que la vaccination n'est pas obligatoire au Québec même si elle est fortement recommandée. La position du collège va dans le sens de cette démarche vu que l'on encourage fortement de se faire vacciner contre la grippe A(H1N1) dans ce contexte actuel de pandémie possible.

Or, nous sommes conscients que la vaccination demeure sur une base volontaire, mais je désire vous faire part des extraits d'un courriel que j'ai reçu de la part de la directrice adjointe au programme à la Direction des études, Madame Linda Deroy, et qui énoncent les conséquences possibles d'un refus de se faire vacciner :

«Les étudiants qui refusent la vaccination ou qui négligent de se faire vacciner doivent prendre conscience du fait qu'ils pourraient être refusés en stage ou être exclus en cours de stage par les milieux qui les reçoivent.

En période de pandémie, les enseignants offriront aux étudiants malades une récupération si la réussite du cours est en jeu et *si la récupération possible est possible*. Cette récupération pourrait être impossible. *Par exemple*, si la durée de la récupération dépasse largement la durée maximale de l'absence en raison de grippe (raison à laquelle la récupération a été autorisée) ou si l'étudiant, parce que non vacciné, est refusé dans les autres milieux de stage disponibles.

Tout enseignant, chargé de cours ou étudiant qui refuse la vaccination accepte et assume les conséquences possibles de sa décision.»

Donc, pour assurer le suivi en lien avec ce qui vous a été mentionné précédemment, je dois en tant que responsable des stages, tenir un registre des personnes vaccinées ou non pour la grippe A(H1N1). Cette responsabilité émerge du fait que je dois attester ceux et celles qui ont ou non été vaccinés dans les différents milieux de stage à leur demande. Face à cela, vous devez donc me remettre votre preuve de vaccination soit en personne à mon bureau (D-1697), soit dans mon casier

ou à votre professeur de stage. Il est à noter que je demande également aux enseignantes de me fournir cette preuve de vaccination. Comme la vaccination est sur une base volontaire, si vous refusez de vous faire vacciner, vous devrez vous présenter à mon bureau (D-1697) du lundi au jeudi de 13h00 à 16h00 et cela jusqu'au 12 novembre 2009 afin de faire signer un document certifiant votre refus. Je devrez donc m'assurer en même temps que votre décision est libre et éclairée.

Bon. Je ne sais pas pour vous, mais en ce qui nous concerne nous en avons déduit que la vaccination était obligatoire faute de quoi nous pourrions échouer nos stages. Je me serais fait vacciner de toute façon puisque dans 2 semaines, en pédiatrie, je suis assurée d'être en contact avec des patients porteurs du virus, et je ne voudrais pas être un vecteur du virus en le ramenant chez moi, le transmettant à mon conjoint, à mes parents, ma nièce de 2 ans, etc.

PREUVE DE VACCINATION PANDÉMIE GRIPPE A(H1N1)

VACCINATION GRIPPE A(H1N1)

Nom : STEPHANIE BEAUCAIRE

Date de naissance : 1970-08-21

Dose	Qté administrée	NOM DU VACCIN	Date	Initiales
1ère dose	☐ 0,25 mL ☑ 0,50 mL	☑ Arepanrix H1N1 avec adjuvant ☐ Panvax H1N1 sans adjuvant ☐ Vaccin monovalent H1N1 sans adjuvant	2009 – 11 – 06	[signature]
2ème dose	☐ 0,25 mL ☐ 0,50 mL	☐ Arepanrix H1N1 avec adjuvant ☐ Panvax H1N1 sans adjuvant ☐ Vaccin monovalent H1N1 sans adjuvant	2009 – –	

Ma vaccination comme tel s'est très bien passé. Je me suis présentée au centre d'hébergement du csss Jeanne-Mance, coin René-Lévesque et St-Dominique, où on effectuait la vaccination des travailleurs de la santé seulement. J'ai attendu environ 15 minutes avant d'être vacciné, ce fut très rapide et efficace. J'ai eu mal au bras pendant 2 jours, pas d'autres effets secondaires. Il faut dire que ça fait trois semaines que je me tape un de ces rhumes, je ne sais pas si j'aurais vu la différence avec les effets du vaccin de toute façon.

lepoint.fr

Grippe A: les 12 millions d'élèves français vont pouvoir être vaccinés

Le Point, 11 November 2009
https://web.archive.org/web/20100102043359/http://theflucase.com/index.php?option=com_content&view=article&id=1739%3Afrench-education-minister-says-all-school-children-to-be-qofferedq-jab-but-not-compulsory&catid=1%3Alatest-news&Itemid=64&lang=en

Douze millions d'élèves scolarisés en France de la maternelle au lycée vont pouvoir bénéficier à partir du 25 novembre, sur la base du volontariat, d'un plan de vaccination contre la grippe H1N1. MAXPPP.

Le ministre de l'Education Luc Chatel a annoncé dimanche qu'une campagne de vaccination contre la grippe A (H1N1) à destination des douze millions d'élèves scolarisés en France, de la maternelle au lycée, serait lancée en France à partir du 25 novembre sur la base du volontariat. Le gouvernement va proposer "aux parents la vaccination de leurs enfants et des adolescents", a dit Luc Chatel invité du journal de France 2, précisant qu'il n'y avait "aucune obligation".

Les parents recevront un bon de vaccination ainsi que deux questionnaires. Le premier portera sur l'accord ou non pour un vaccin, le deuxième sur les problèmes d'incompatibilité. "Et c'est dans l'établissement que la vaccination aura lieu", a expliqué Luc Chatel. Il n'y aura "aucune obligation", a-t-il insisté. "Ce sont les parents qui décideront si oui ou non leur enfant doit être vacciné". Le ministre n'a en revanche pas donné d'indication quant à la possibilité d'une éventuelle vaccination pour les 850.000 enseignants.

Concernant les 6,6 millions d'enfants scolarisés en maternelle et dans le primaire, les vaccinations auront lieu dans les centres de vaccination de proximité. Pour les 5,3 millions de collégiens et les lycéens, elles se dérouleront dans les établissements scolaires. Le ministre a précisé qu'une "accélération de la diffusion de l'épidémie de grippe A" avait été constatée récemment. "Le nombre de consultations a été multiplié par 10 la semaine dernière par rapport à ce qu'il était au début du mois d'octobre", a dit Luc Chatel.

Une minorité de Français prête à se faire vacciner

La campagne de vaccination pour le grand public doit démarrer le 12 novembre. Quelque 6 millions de personnes seront invitées à se faire vacciner lors de la première vague: femmes enceintes, public fragile et entourage des nourrissons de moins de six mois. La vaccination avait précédemment été ouverte le 20 octobre à la majorité des personnels de santé. Alors que la circulation du virus s'intensifie depuis trois semaines, l'Institut de veille sanitaire (InVS) a annoncé huit nouveaux décès attribués à la grippe H1N1 depuis le 3 novembre, portant à 30 le bilan des décès en France métropolitaine.

Selon un sondage paru dans l'hebdomadaire Marianne , seule une minorité de Français (21 %) se déclare prête à se faire vacciner contre la grippe H1N1. 61 % d'entre eux jugent par ailleurs que le gouvernement "en a trop fait" sur la grippe, selon ce même sondage. Interrogé sur ce point, Luc Chatel a répondu que "le rôle du gouvernement est de se tenir prêt". "Nous assistons depuis quelques jours à une accélération de la diffusion de l'épidémie, puisque le nombre de consultations a été multiplié

par dix la semaine dernière par rapport à ce qu'il était au début du mois d'octobre", a-t-il relevé. "Je ne suis pas vacciné car les ministres ne font pas partie des publics prioritaires. Lorsque les publics prioritaires seront vaccinés, oui, je me ferai vacciner", a-t-il déclaré.

Le patron des députés UMP Jean-François Copé a confié dimanche qu'il n'avait pas encore "pris sa décision" sur le fait de se faire vacciner contre la grippe H1N1, à la veille du lancement par le gouvernement d'une campagne massive de vaccination. Le gouvernement a commandé auprès des laboratoires 94 millions de vaccins. Compte tenu des 10 % de doses qui devraient aller aux pays en développement, 84 millions de doses seront disponibles pour les Français.

French Education Minister says all school children to be "offered" jab but not compulsory

The Flu Case, 11 November 2009, 16:36

https://web.archive.org/web/20100102043359/http://theflucase.com/index.php?option=com_content&view=article&id=1739%3Afrench-education-minister-says-all-school-children-to-be-qofferedq-jab-but-not-compulsory&catid=1%3Alatest-news&Itemid=64&lang=en

The French Education Minister Luc Chatel has said that all 12 million school children in France are to be "offered" the "swine flu" jab but that vaccinations will not be compulsory.

The swine flu jab will be available for 6.6 million children in primary schools at special vaccine centers while for the 5.3 million pupils in secondary schools, it will be available at school.

CBC news

Children to be bused to vaccination centres

CBC News, 11 November 2009, 9:13 PM ET
https://web.archive.org/web/20091116174907/http://www.cbc.ca/canada/montreal/story/2009/11/11/mtl-children-vaccine-busses.html

Quebec health officials say they are close to setting up a system to bus schoolchildren to swine flu vaccination centres.

Putting together a vaccination plan involving more than one million school children is not an easy task, said Quebec's chief public health officer, Dr. Alain Poirier.

"A few details have to be fixed, but it's going in the right direction," he said at a news conference in Quebec City Wednesday.

The chief of health protection at Montreal's public health department, Dr. Terry-Nan Tannenbaum, said there is still a lot to figure out.

"There's the consent to be vaccinated; there's the consent to be transported; … there's making sure we have all the information, for instance, on allergies or other problems," said Tannenbaum.

One Montreal parent said the idea to bus students to clinics isn't such a good one.

"Many children will be afraid," said Elise Desjardins, the mother of two school-age children.

She said children might be more at ease if they got the flu shot at their own school.

At the national assembly, Parti Québecois health critic Bernard Drainville said the plan sounds like a field trip destined for failure.

"It is obvious the solution is to do vaccinations in schools. Why aren't you doing it?" Drainville asked the Liberals during question period.

"[This is the way] to vaccinate the most students possible ... the most efficient way," replied Liberal Health Minister Yves Bolduc.

He went on to say that if the government slows down the vaccination process for schoolchildren, it will delay the rollout of vaccination for the rest of the population.

Three new deaths

On Wednesday, public health officials in the province confirmed three more deaths related to the H1N1 influenza A virus, which is responsible for the current swine flu pandemic.

That brings to 20 the number of flu-related deaths in Quebec since the second wave of swine flu began Aug. 30.

Only one person has died of symptoms directly relating to the swine flu, said Poirier.

"All the others had underlying conditions," Porier said.

There have been 923 confirmed cases of the H1N1 flu in Quebec so far in this second wave, Poirier said.

"That's the total number for the last two and half months," he said. "But most of them are out of the hospital."

Poirier also noted that 58 per cent of the 923 cases involve people 19 and under.

New vaccination centre in West Island

Health officials in Montreal have opened a second H1N1 vaccination centre in Montreal's West Island region.

The decision to open the centre at Spring Garden Elementary School in Dollard-des-Ormeaux five days ahead of schedule is an attempt to reduce lineups at the only other centre in the West Island – Allencroft Elementary in Beaconsfield, officials said.

"Monday and Tuesday, all the coupons [given to those waiting in line for flu shots] had been given out earlier in the day," said Montreal Public Health Department spokesperson Deborah Bonney. "That meant the register was filled right up 'til eight in the evening."

Officials at the West Island Health and Social Services Centre said the new centre was working well on its first day of operation.

"Things are going very, very smoothly," said spokesman Louis-Pascal Cyr. "People who are coming in are being put into the circuit right away."

Health agency president catches flu

Also on Wednesday, Montreal Health Officials pointed to one of their own as proof of why Quebecers should be vaccinated against the swine flu.

Montreal Health Agency president David Levine has come down with a case of the illness.

He felt the first symptoms of the flu over the weekend, officials said.

"He's doing everything that is written in the book," said Dr. Louise Ayotte of the Montreal Health Agency. "He stays home, takes a lot of liquids. It seems to be a mild to moderate H1N1."

Levine was not in any of the priority groups for vaccination.

Deputies Hold Boy Who Fled Flu Shot
Student refused; was held down for vaccination

The Intelligencer, 11 November 2009
https://web.archive.org/web/20091114124507/http://www.theintelligencer.net/page/content.detail/id/530805.html?nav=515

Wheeling - *It took the strength of two sheriff's deputies to keep* a middle schooler still enough to receive a shot of the swine flu, or H1N1, vaccine at a recent clinic.

During a regular Wheeling-Ohio County Health Board meeting Tuesday, health department Administrator Howard Gamble told board members about the student's attempt to flee Wheeling Middle School during a vaccination clinic held there last Friday.

He noted the boy's mother could not bear to watch the scene and left the gymnasium. Out of apparent fear of receiving the injection, the student ran out of the building. The school's resource officer, Ohio County Sheriff's Deputy John Haglock, coaxed the boy back inside. Once at the shot station, however, Haglock apparently needed some help keeping the boy still, and another deputy assisted.

"He tried to run. I looked over and saw two sheriff's deputies holding a kid down," Gamble said. "Mom took off, she couldn't take it. You had one nurse with the needle, two deputies holding him, one nurse is grabbing hands - because that's what they want to do, to go after the needle. And that's the last thing you want."

Gamble said as soon as the nurse gave the boy his injection and told him he was done, he hopped up like nothing had happened."For the most part they go very easy. As far as the shots, every once in awhile you have to hold down one or two - but that's why mom is there or dad is there," Gamble said.

He added after the meeting that Friday's incident was the only time Ohio County deputies have held a student during a shot. "They're mostly there for parking and directions. They also know the kids. ... They were our first line of contact when setting up the clinics," Gamble said.

Neither Sheriff Pat Butler nor Haglock could be reached for comment. A sheriff's department official said Haglock is on vacation for the next two weeks.

During a clinic Tuesday at Bridge Street Middle School, similar scenes took place - though not quite as dramatic and not involving officers of the law. A couple sets of parents could be seen keeping their children from wiggling away while a nurse quickly administered the vaccine.

Ten-year-old Austin Price, the son of Jennifer and Josh Price, decided to take the shot standing up and with no assistance from his mom or dad. He even smiled for a photograph. And on a scale of 1-10, how painful was the shot? A "4," he answered.

By 7:30 p.m., 391 students from Bridge Street and Elm Grove and Middle Creek elementary schools had been vaccinated. Gamble expected that by the clinic's end at 8 p.m., more than 400 would have received the inoculation.

The final two student clinics in Ohio County are:

- For students of Warwood Middle School, Corpus Christi, Warwood and West Liberty Elementary schools from 3:30-8 p.m. Thursday at Warwood Middle School Gym.
- For students of Wheeling Park High School from 9 a.m. to 2 p.m. Saturday at WPHS Activities Center.

Tuesday's health board meeting was held in the county commission board room - located on the second floor of the City-County Building - due to the health department's board room being used for storage.

La polémique qui enfle autour des vaccins contre la grippe porcine commence à susciter des remous dans les rangs du Parlement. En janvier, une enquête sera lancée pour voir si le plan pour contrer la pandémie a bien fonctionné, selon Urs Schwaller.

La commission de la santé publique du Conseil des Etats a renoncé à intervenir pour l'heure, a déclaré le Fribourgeois, qui la préside. Mais d'autres instances, comme la délégation des finances, risquent de s'emparer de l'affaire.

Un crédit de 84 millions a été libéré pour l'achat de vaccins contre le virus de la grippe A/H1N1, a rappelé M.Schwaller. Or, il semble que la Suisse va céder une partie encore non définie des doses - 10, 20 ou 30% - à d'autres pays, selon lui.

Dans ces conditions, "nous voulons savoir ce qu'il est arrivé de l'argent que nous avons octroyé pour lutter contre la pandémie".

THE FLU CASE

Swiss Parliament to launch inquiry into swine flu vaccination programme

The Flu Case, 11 November 2009, 13:38
https://web.archive.org/web/20100102004502/http://theflucase.com/index.php?option=com_content&view=article&id=1734%3Aswiss-parliament-to-launch-inquiry-into-swine-flu-vaccination-programme&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Swiss parliament is to launch an investigation into the controversial swine flu vaccination programme in January, according to local media.

Urs Schwaller said that a goal of an inquiry would be to identify how the 84 million CHF that had been earmarked for the pandemic has been spent.

Weniger Bürokratie: Ärzte müssen Verdacht auf Schweinegrippe nicht mehr melden

Merkur, 12 November 2009, 22:31 Uhr
https://www.merkur.de/deutschland/weniger-buerokratie-aerzte-muessen-verdacht-schweinegrippe-nicht-mehr-melden-zr-527512.html

Hamburg/Berlin – Wegen der schnell steigenden Zahl von Schweinegrippe-Kranken und der laufenden Massenimpfung müssen Ärzte in Deutschland ab Samstag nicht mehr jeden Verdachtsfall melden.

Eine Sprecherin des Bundesgesundheitsministeriums bestätigte am Donnerstagabend einen entsprechenden Bericht des "Westfalen-Blatts" (Freitag). Ärzte würden so von Verwaltungsaufgaben entlastet.

Nach einer neuen Verordnung des Bundesgesundheitsministeriums zur Meldepflicht bei Influenza (Schweinegrippe), die am Freitag im Bundesanzeiger stehe und damit ab Samstag gelte, entfällt beireinen Verdachtsfällen sowie Grippekranken ohne Labornachweis die Meldepflicht. Den Gesundheitsämtern müssen nur noch Todesfälle gemeldet werden, die in Verbindung mit der Schweinegrippe stehen. Außerdem müssen Fälle, in denen die Infektion nach Labor- Untersuchungen eindeutig nachgewiesen wurde, an die Gesundheitsämter und schließlich an das Robert-Koch-Institut gegeben werden.

Die bisherige Meldepflicht, die seit Anfang Mai galt, mache im Hinblick auf den Erregernachweis keinen Sinn mehr, sagte Susanne Glasmacher vom Robert-Koch-Institut dem "Westfalen-Blatt".

Nach Angaben der Gesundheitsbehörden würden Ärzte bei Grippekranken nur noch in Einzelfällen einen Labortest beantragen. Dies sei zum Beispiel bei Menschen mit schweren Vorerkrankungen notwendig, bei denen sich ein schlimmer Verlauf der Grippe abzeichnen könne. Auch bei einem größeren Ausbruch, wie in Schulklassen, könnten Laboruntersuchungen beantragt werden.

Nach Schätzungen der Gesundheitsbehörden haben sich seit Mai bundesweit etwa 55 000 Menschen mit dem Virus infiziert. Die meisten Patienten sind inzwischen wieder gesund.

Wolf Blitzer

The Situation Room: A Rush Transcript Anchor

CNN, 12 November 2009, 16:00 ET
https://transcripts.cnn.com/show/sitroom/date/2009-11-12/segment/01

Wolf Blitzer: The Centre for Disease Control and Prevention now says 3,900 Americans have died from swine flu since April. That's almost four times the previous estimate, but it doesn't mean that the virus is more dangerous. Instead, the CDC is now including deaths caused by complications, things like pneumonia and bacterial infections. It's estimated that 22 million Americans have caught the swine flu. Experts say the new estimated death toll sounds much more reasonable.

Do you know where to go to get vaccinated for the H1N1 or the seasonal flu? Google is now teaming up with the CDC to bring you the most up- to-the-minute information about flu shots online.

Abbi Tatton is working that for us.

Abbi, tell us where people who are interested can go.

Abbi Tatton, CNN Internet Reporter: Wolf, it's the federal government that orders the supplies of the H1N1 vaccine. And then it's the state and local governments that actually dole those vaccinations out.

So, until now, it's been pretty difficult to find a central place to get that information, to find out where to go. Well, that's something that Google has been working on. They've launched Google.com /flushot this week, if I can show you here. It combines Google Maps with information from the state and local governments on where to find these flu shot clinics.

If you look at the blue syringe there, that's going to show you where an H1N1 flu shot clinic is happening and the times. A red syringe is going to show you where the regular seasonal flu shot can be found.

Now, like the vaccination program itself, this is a work in progress. So far, Google says they have information from just 20 states across the country that they're adding into this map. They're working on getting more.

Another piece of advice when you're using this as well, when you find out where these clinics are happening, check in and find out if they've still got supplies of the vaccine. This is changing so quickly, and you don't want to be in one of these lines just to find out that they've run out – *Wolf*.

Blitzer: Abbi, thank you.

While millions of Americans wait to get the swine flu vaccine, many are outraged over reports that several big Wall Street banks are getting doses for some of their employees. The story caused quite an uproar last week, so we asked our Brian Todd to take a closer look and give us a reality check.

Precisely, Brian, what is going on here?

Brian Todd, CNN Correspondent: Wolf, it is true that some of those big Wall Street giants do have doses of the vaccine on hand while some pediatricians offices do not. But in checking into this further, we discovered this is not a case of the bigwigs cutting in line.

Todd: (voice-over): Delays in production and anxious waiting periods are frustrating enough.

Unidentified Male: We had to wait. And now they ran out already. So we have to wait for the next shipment, I guess.

Todd: Now another controversy surrounding the swine flu vaccine. Who gets access?

While many Americans deal with long lines and pediatricians' and obstetricians' offices wait along with them, some of Wall Street's biggest firms already have the vaccine on hand. Goldman Sachs has at least 200 doses available it to its employees. CNN's parent company, Time Warner, is scheduled to get doses. Citigroup has at least 1,200 doses available to its employees, the same number as New York's Lenox Hill Hospital, not far away.

But hold your outrage. Officials from the New York City Health Department and the Centers for Disease Control tell CNN the system is set up so that hospitals, doctors' offices and private companies have to contact their local health departments and order the vaccine.

Dr. Jay Butler, CDC: And then those are forwarded to CDC. And it's an interactive process as we learn more about how much vaccine is available and in what formulation.

Todd: Then, based on the population of that area, the CDC tells the local health department how much vaccine it can order. And local officials decide where it will go.

But before you blame New York's Health Department for Citigroup's 1,200 doses of swine flu vaccine, remember that your doctor's office is responsible for ordering it for you. And according to the New York Health Department, out of more than 2,400 OB-GYN offices in New York City, only 65 of them have ordered the H1N1 vaccine, and 36 percent of pediatricians' offices in the city have not placed orders. It may not be the perfect system for distributing the vaccine, but one public health expert says there is a benefit to the big firms having it.

Dr. William Schaffner, Vanderbilt University: If a large organization has an occupational health service, and those people have applied for vaccine, they may be getting the vaccine more quickly than people who work in a mom-and-pop operation.

Todd: And a New York Health Department spokeswoman tells us these firms cannot get the vaccination unless they agree to give it only to employees who fall into those high-risk categories designated by the CDC. Those are pregnant women, people who live with or care for children younger than six months old, people who have chronic health disorders or compromised immune systems, and others like that. Spokesmen for Citigroup and Goldman Sachs assure us they are committed to giving the vaccine only to those at high risk - Wolf.

Blitzer: All right. Good to know. Thanks for clarifying a lot of misinformation out there. That's what you do, and you do it well, Brian.

Swine flu skepticism demands deft response

Reuters, 12 November 2009, 8:20 PM GMT+8
https://www.reuters.com/article/GCA-SwineFlu/idUSTRE5A52FU20091112/

London (Reuters) - European scientists and health authorities are facing angry questions about why H1N1 flu has not caused death and destruction on the scale first feared, and they need to respond deftly to ensure public support.

Accusations are flying in British and French media that the pandemic has been "hyped" by medical researchers to further their own cause, boost research grants and line the pockets of drug companies.

Britain's Independent newspaper this week asked "Pandemic? What Pandemic?"

In their response, scientists are walking a fine line.

They say that although the virus is mild, it can still kill, and that the relatively low fatalities in Europe are in part the result of official response to their advice.

On suggestions of "hyping" the threat to boost research funding, they point out that while we know enough to start to protect the vulnerable, we need to know a lot more to conquer the virus, and funding for new research and drugs is vital to be equipped for future pandemics.

H1N1 is hitting a younger population - adults in their 20s and 30s and children - and the global death count so far is more than 6,000, according to the WHO.

While seasonal flu attacks about 20 percent of the population in an average year, experts estimate that even in Britain – the worst-hit country in Europe so far -- fewer than 10 percent of people have had H1N1 swine flu.

Fred Hayden, influenza research co-ordinator at the Wellcome Trust and a former World Health Organization (WHO) expert, said early planning is paying off, but added:

"I wouldn't characterize this as a "mild" pandemic at all. We are seeing some very unfortunate loss of life. I think it a bit early to make that judgment."

Yet the word "mild" is used so often to describe H1N1's impact in most people that it is prompting skeptical publics to ask what all the fuss is about. Why they should care? And why take a vaccine?

France's Le Parisien newspaper ran the headline: "Swine flu: why the French distrust the vaccine" and noted a gap between the predicted impact of H1N1 and the less dramatic reality.

"Although some 30-odd people have died....the disease is not really frightening," it said. "Dangerous liaisons between certain experts, the labs and the government, the obscurity of the contracts between the state and the pharma firms have added to the doubt."

Scenario Revised Down

In Britain, health authorities' original worst-case scenario – which said as many as 65,000 could die from H1N1 -- has twice been revised down and the prediction is now for around 1,000 deaths, way below the average annual toll of 4,000 to 8,000 deaths from seasonal winter flu.

A group of eminent scientists who called a media briefing in London this week to announce 7.5 million pounds ($12.4 million) of new funding for British research into H1N1 found their plans hijacked by reporters asking why the pandemic was so weak.

Scientists say the truth is they can't win.

The WHO has been urging countries to prepare for a flu pandemic since 1997, when H5N1 avian flu infected 18 people in Hong Kong and was stopped only after a mass slaughter of birds. The re-emergence of H5N1 in China and South Korea in 2003 fueled the urgency to get ready.

Now that it has arrived, the apparently low impact of the H1N1 pandemic so far may show that the planning is paying off, the Wellcome Trust's Hayden said.

British officials repeatedly said the nation was well-prepared for a flu pandemic. It had high stocks of antivirals and orders for enough vaccines to cover its population in place very early.

Hayden said comparisons with earlier flu pandemics like the one in 1918, which killed an estimated 230,000 people in Britain and up to 50 million worldwide, were skewed by the fact that there were so few effective treatments at that time.

"We didn't have antivirals then, and we didn't have antibiotics for the high frequency of bacterial complications," he said. "We have these kinds of interventions now and they are making a difference."

At the funding briefing, Peter Openshaw, director of the center for respiratory infection at Imperial College London, dismissed suggestions that scientists were enjoying the fruits of a pandemic in the form of big grants to keep them in work.

"This is not something that we are licking our lips and welcoming," he said. "But there is certainly an enormous outbreak of scientific information that has greatly enriched our understanding of flu."

THE FLU CASE

Ärzte müssen Verdacht auf Schweinegrippe nicht mehr melden

The Flu Case, 13 November 2009, 17:16

https://web.archive.org/web/20100102031026/http://theflucase.com/index.php?option=com_content&view=article&id=1779%3Agermany-loosens-qswine-fluq-reporting-requirements&catid=1%3Alatest-news&Itemid=64&lang=en

Wegen der rasanten Ausbreitung der Schweinegrippe in Deutschland wird die Meldepflicht eingeschränkt. Ärzte müssen ab Samstag Verdachtsfälle und Grippekranke ohne Labornachweis nicht mehr an die Gesundheitsämter melden, wie ein Sprecher des Bundesgesundheitsministeriums in Berlin mitteilte. Inzwischen gibt es den 14. bestätigten Todesfall.

Laut Bundesgesundheitsministerium müssen den Gesundheitsämtern künftig nur noch Patienten gemeldet werden, bei denen die Infektion aufgrund von Laboruntersuchungen eindeutig nachgewiesen wurde. Zudem müssten auch weiterhin Todesfälle gemeldet werden, die in Verbindung mit der Schweinegrippe stehen, sagte der Ministeriumssprecher. Er bestätigte damit einen Bericht des Bielefelder "Westfalen-Blatt".

Die Sprecherin des Robert-Koch-Instituts (RKI), Susanne Glasmacher, sagte der Zeitung, die bisherige Meldepflicht sei im Hinblick auf den Erregernachweis nicht mehr sinnvoll. Ärzte beantragen bei Grippekranken demnach nur noch in Einzelfällen einen Labortest. Nach Schätzungen der Gesundheitsbehörden haben sich seit Mai bundesweit 55.000 Menschen mit dem Virus infiziert.

Aus Sachsen wurde ein weiterer Todesfall - der 14. in Deutschland - gemeldet. Nach Angaben des sächsischen Sozialministeriums in Dresden starb ein 44-jähriger Mann aus dem Vogtland am Donnerstagabend nach einer Infektion mit dem H1N1-Virus. Vorerkrankungen oder Risikofaktoren waren bei dem Betroffen demnach bisher nicht bekannt.

Ungeachtet der Ausbreitung der Schweinegrippe hält laut einer Umfrage von Infratest dimap im Auftrag des ARD-Morgenmagazins nur jeder vierte Deutsche eine Impfung dagegen für notwendig. 43 Prozent würden sich auf keinen Fall gegen die Schweinegrippe impfen lassen. Nur 14 Prozent der Befragten gaben an, dass sie sich aller Voraussicht nach den Impfschutz holen. Weitere elf Prozent sind sich schon ganz sicher. Befragt wurden am Dienstag und Mittwoch tausend Bundesbürger.

Germany loosens "swine flu" reporting requirements

The Flu Case, 13 November 2009, 17:16

https://web.archive.org/web/20100102031026/http://theflucase.com/index.php?option=com_content&view=article&id=1779%3Agermany-loosens-qswine-fluq-reporting-requirements&catid=1%3Alatest-news&Itemid=64&lang=en

The requirement for German doctors to report the swine flu has been dropped.

From Saturday, doctors need not report suspected cases of swine flu or cases of infection.

Doctors only need report cases of swine flu to the authorities when the swine flu virus has been confirmed by a lab test, according to a Health Ministry.

Earlier this week, Austria and France loosened their swine flu reporting requirements at a time when government and the media are reporting a huge increase.

The lack of any requirement to perform lab tests for alleged "swine flu" patients will make it easier for authorities to inflate swine flu sickness figures.

AFTONBLADET

Kvinna stal svinvaccin

Aftonbladet, 13 November 2009
https://web.archive.org/web/20091116071913/http://www.aftonbladet.se/nyheter/article6115193.ab

En kvinna i Luleå ville verkligen ha vaccin mot svininfluensan.

Därför genomförde hon en kupp – mot vaccinationsmottagningen i Kyrkans hus.

Kvinnan störtade in på mottagningen vid 15-tiden i går eftermiddag. Hon fick tag i tre vaccindoser och försvann därefter ut genom dörren, skriver NSD.

Utanför iakttogs hon när hon sprang fram till en väntande bil som snabbt körde från platsen.

Polisens länsvakthavande befäl Rolf Hamstig uppger till tidningen att man hittills inte lyckats hitta kvinnan, men att polisen fått in vissa intressanta tips i fallet.

THE FLU CASE

Woman stole "swine flu" vaccine in Sweden

The Flu Case, 13 November 2009, 07:36
https://web.archive.org/web/20100102042841/http://theflucase.com/index.php?option=com_content&view=article&id=1767%3Awoman-stole-qswine-fluq-vaccine-in-sweden&catid=1%3Alatest-news&Itemid=64&lang=en

A woman was seen rushing into a local vaccine station in Luleå in the north of Sweden, grabbing three syringes and then rushing back out into a waiting car. The car drove away at a high speed.

According to the local Police, Rolf Hamstig, there is no trace of the woman but certain tips to the police has been given.

It is unclear weather the woman stole the vaccine (which is given for free in Sweden) for her own use or if she stole it in order to be able to test it in an independant lab to objectively establish what it contains. This might be a big problem since the Swedish agreement with GlaxoSmithKline, the manufacturer of the poisonous Pandemrix "swine flu" vaccine forbids disclosure of the real ingredients in the shots

FDA chief defends H1N1 vaccine supply

Reuters, 13 November 2009, 6:55 AM GMT+8
https://www.reuters.com/article/idUSTRE5AB574/

New York (Reuters) – The head of the U.S. Food and Drug Administration defended the agency's decision not to use an additive that could have stretched swine flu vaccine supplies, adding that doses should be coming more regularly.

The vaccine to prevent the H1N1 strain of influenza has been in short supply following production issues but more doses are becoming available, FDA Commissioner Margaret Hamburg said on Thursday at the Reuters Health Summit in New York. – "The gap between need and availability is narrowing. I think we are going to see doses coming off the lines and into people's arms or noses on a regular basis now," Hamburg said.

U.S. health officials have been scrambling to get the swine flu vaccine to market after the virus emerged too late to be included in this year's regular seasonal flu version. Initially, officials said there would be enough for everyone, but the public quickly grew frustrated when supplies ran short.

The FDA has approved H1N1 vaccine from five makers who already produce seasonal flu vaccine – GlaxoSmithKline Plc, AstraZeneca Plc's MedImmune unit, Novartis, Sanofi-Aventis, and CSL Limited. Both products use an egg-based technology to produce the vaccine, but the H1N1 virus grew slower than expected in the eggs, Hamburg said. She added the agency is working with manufacturers to move toward other, more efficient technology such as cell-based cultures that could spur production.

Hamburg said it was not too late for people to benefit from immunization.

Some experts have suggested the government could have increased supplies by embracing adjuvant vaccine technology that is widely used in Europe.

Adjuvanted vaccines contain an additive to boost the immune system response and need less of the active ingredient than the unadjuvanted types approved by the FDA. But Hamburg said they have not been widely tested and that the agency did not want to risk using them when standard vaccines worked well with a single dose. – "Had the shape of epidemic or the characteristics of the virus and the disease required it, we would have moved toward an adjuvanted approach," she said.

"Europe took a little bit more of a risk. Yes, there was experience with an adjuvanted vaccine but it was really only used in the elderly and there wasn't experience with that vaccine in other populations, including pregnant women and children."

Still, people remain wary of vaccine supplies and the public outcry has prompted the White House to look into the issue. It is still somewhat unclear when enough vaccine will become available to patients to meet demand.

Earlier on Thursday, Centers for Disease Control and Prevention officials said they had expected 8 million H1N1 vaccine doses this week but that they are unsure how many they will get. Hamburg, who took office in May, said that while the government may have over-promised on the availability of the vaccine earlier this year, lessons had been learned. – "We are also going to be better-prepared the next time around," she said. As for her own family, Hamburg said it was surprisingly easy to get her own children vaccinated. – "I just called my pediatrician's office ... and they said 'We have it. just come in,'" she said. "I just walked in on a Saturday morning with my kids, and they got it. No wait. No complications."

Le Télégramme

Grippe A.À Le Foll, 10% du personnel vacciné

Le Telegramme, 13 Novembre 2009 à 00h00
https://www.letelegramme.fr/cotes-d-armor/saint-brieuc-22000/spangrippe-aspana-le-foll-10-du-personnel-vaccine-685829.php

Depuis dix jours, le personnel del'hôpital Yves-LeFoll peutse faire vacciner contre lagrippeA. Cen'est pas encore la grosse affluence...

Marie-Louise Faramus, infirmière, attend les candidats à la vaccination parmi le personnel de l'hôpital. Les Drs Vaucel (à gauche) et Beuscart sont déjà passés sous sa seringue...

On en entend parler depuis si longtemps qu'on avait fini par la prendre pour un mythe... Mais la grippe A est bien là. Dans le département, une dizaine de cas ont été, pour l'instant, confirmés. «Mais c'est en train de se précipiter. Le nombre de tests positifs augmente de façon importante», précise le Dr Jacques Vaucel, à l'hôpital. Ce biologiste est responsable de la lutte contre les maladies nosocomiales dans l'établissement. Il forme avec le Dr Claude Beuscart, chef du service «maladies infectieuses», et avec Hélène Colas, directrice adjointe, le trio opérationnel du plan «anti-grippe A». Tandis que les centres de vaccination tout public ouvraient hier, dans toute la France (lire par ailleurs), ils organisent, depuis le 2novembre, la prophylaxie à l'égard du personnel hospitalier. Avec 2.700 salariés, l'hôpital Yves-Le Foll est une vraie ville, dont, pour l'instant, les «habitants» n'ont pas répondu massivement à l'invitation.

La moitié des médecins

«Nous avons pratiqué 290 injections, sur un peu plus de 10% du personnel. C'est conforme à la moyenne nationale», soulignait, hier, le Dr Beuscart. Directeur adjoint chargé de la communication, Bertrand Barbançon met en relief une certaine hiérarchie dans la collaboration. «Nous avons vacciné une centaine des 190médecins à temps plein de l'établissement, nettement moins d'infirmières, encore moins d'aides-soignants et les agents de service sont les derniers à se sentir concernés», souligne-t-il. «C'est important de savoir que les gens les plus qualifiés se mobilisent».

Responsabilité

«Se faire vacciner, c'est se protéger soi-même, mais aussi protéger ses proches et ses patients fragilisés. C'est aussi faire le maximum pour assurer la continuité du service public hospitalier. C'est une question de responsabilité», énonce le Dr Beuscart. «On aurait pu rendre la vaccination obligatoire pour le personnel de santé. C'est un choix politique qui n'a pas été retenu. Après tout, nous sommes en démocratie...», observe le chef de service. Reste que, pour enrayer efficacement une épidémie, il faut vacciner 70% de la population. «On en est loin», remarque le DrVaucel. Différentes sources annoncent le pic de l'épidémie pour la mi-décembre: cela laisse le temps à chacun de réfléchir.

Des réticences

Selon le Dr Beuscart, les réticences seraient entretenues par «une campagne des lobbies anti-vaccins». «C'est vrai qu'on n'a pas de recul sur ce vaccin, mais quand on en aura, l'épidémie sera passée. Ses composants sont parfaitement connus: du virus inactivé, donc incapable de transmettre la maladie, et des adjuvants qui en améliorent l'efficacité». Il ne le cache pas, dans l'établissement même, certains médecins sont hostiles à la vaccination. Le Dr Vaucel partage le point de vue de son confrère sur la nécessaire adhésion du personnel hospitalier, mais il est moins catégorique sur une vaccination massive de la population. «Ce vaccin n'est efficace qu'à 70%», fait-il remarquer. «Beaucoup de personnes nées avant 1957 sont immunisées par la circulation ancienne de virus voisins. Donc, ce sont les jeunes qui seront les plus touchés. Il faut donc qu'ils se sentent concernés», avertit Bertrand Barbançon.

Der Schweinegrippe-Dax: Diese Firmen wollen gegen Schweinegrippe impfen

BILD, 13 November 2009, 16:09 UHR
https://web.archive.org/web/20091115002945/http://www.bild.de/BILD/news/2009/11/13/schweinegrippe-impfung-dax-unternehmen/umfrage-h1n1.html##

Die Schweinegrippe – immer mehr Kranke, immer mehr Tote: Doch fast die Hälfte der Deutschen will sich auf keinen Fall impfen lassen. Auch die deutschen Dax-Konzerne halten sich bei den Impfungen zurück. BILD.de hat nachgefragt, welche Firmen ihre Mitarbeiter impfen lassen wollen.

Wie eine Umfrage von Infratest dimap ergab, hält nur jeder vierte Deutsche eine Impfung für notwendig. Nur elf Prozent wollen sich definitiv impfen lassen. 1000 Personen wurden befragt.

Nach Schätzungen der Gesundheitsbehörden haben sich seit Mai bundesweit 55 000 Menschen mit dem Virus infiziert, bisher starben 18 Menschen. Erst am Freitag gab es in Köln und Sachsen zwei Todesopfer zu beklagen...

Trotzdem geben sich die deutschen Großunternehmen wenig impflustig: Nur die Telekom, SAP, ThyssenKrupp und RWE wollen ihre Mitarbeiter selbst impfen lassen. ThyssenKrupp und RWE haben sogar schon damit begonnen. Bei einigen Firmen (z.B. Daimler) werden nur Schlüsselgruppen wie Feuerwehr und ärztliches Personal geimpft.

Die meisten Dax-Firmen aber impfen nicht selbst, sondern verlassen sich auf Gesundheitsbehörden und Ärzte, wie eine Umfrage von BILD.de ergab. Häufiges Argument: Die Situation im Unternehmen sei noch sehr entspannt und noch weit von einem Schreckenszenario mit massenhaftem Ausfall der Belegschaft entfernt.

Einige Unternehmen wissen nicht mal, ob Betriebsärzte überhaupt gegen die Schweinegrippe impfen dürfen. BILD.de fragte beim Gesundheitsministerium Nordrhein-Westfalen nach. Ein Sprecher: "Betriebsärzte dürfen impfen. Allerdings kann es sein, dass die Bundesländer das unterschiedlich handhaben."

Few German corporations plan to give jab to staff, reports Bild

The Flu Case, 14 November 2009, 12:58
https://web.archive.org/web/20100102042356/http://theflucase.com/index.php?option=com_content&view=article&id=1792%3Afew-german-corporations-plan-to-give-jab-to-staff-reports-bild&catid=1%3Alatest-news&Itemid=64&lang=en

According to the German news paper Bild, few German corporate giants intend to organise in house swine flu vaccination programmes for their staff.

Telekom, SAP, ThyssenKrupp und RWE are among the companies that plan to give the swine flu jab to staff, reports Bild. ThyssenKrupp and RWE have already started vaccination staff.

Daimler plans to give the jab to key personnel such as firefighters and health workers.

Bild reports that only 11% of the people in Germany defintely intend to take the jab according to the latest poll by Infratest dimap.

Swissmedic autorise le vaccin Celtura

SE, 13 Novembre 2009
https://www.admin.ch/gov/fr/accueil/documentation/communiques.msg-id-30101.html

Berne, 13.11.2009 – Swissmedic, l'Institut suisse des produits thérapeutiques, a autorisé un nouveau vaccin contre la grippe porcine A(H1N1). Il s'agit de Celtura, fabriqué par l'entreprise Novartis. Cette nouvelle autorisation de Swissmedic porte à trois le nombre de vaccins contre la grippe A(H1N1) désormais disponibles en Suisse.

Contrairement aux vaccins Focetria et Pandemrix déjà autorisés en octobre, le composant antigénique de Celtura n'est pas fabriqué sur la base d'œufs embryonnés de poules mais d'une culture cellulaire. Ce procédé de fabrication inédit a été autorisé par Swissmedic.

Sur la base des données cliniques existantes, Celtura a été autorisé pour les enfants à partir de trois ans ainsi que pour les adultes de tous les groupes d'âges. Les données montrent également que, pour les adultes à partir de 40 ans, deux injections sont requises pour parvenir à une immunisation suffisante. Le vaccin doit donc être administré à deux reprises, en respectant un intervalle de trois semaines.

Aucune autre demande d'autorisation de vaccin pandémique A(H1N1) n'a pour l'instant été soumise à Swissmedic. L'institut informera d'éventuelles adaptations des autorisations existantes de vaccins dès qu'il aura connaissance de nouvelles informations. Swissmedic tient compte également dans ce domaine des évolutions intervenant au plan international.

Effets indésirables

Il est demandé aux patients qui présenteraient des symptômes importants ou inhabituels après vaccination de consulter leur médecin ou leur pharmacien. Quant aux spécialistes, ils disposent d'un système en ligne spécial d'annonce d'effets indésirables présumés, grâce auquel l'institut peut surveiller en temps réel la sécurité des vaccins contre la grippe A(H1N1).

THE FLU CASE

La Suisse autorise le vaccin Celtura de Novartis contre le H1N1

The Flu Case, AFP, 13 November 2009
https://web.archive.org/web/20100102035827/http://theflucase.com/index.php?option=com_content&view=article&id=1799%3Aswissmedic-gives-surprise-approval-to-celtuta-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

GENÈVE – La Suisse a autorisé vendredi l'utilisation du vaccin Celtura, produit par le groupe pharmaceutique helvétique Novartis, contre la grippe H1N1, mettant ainsi fin à des rumeurs circulant dans la presse indiquant que ce vaccin ne pourrait pas recevoir le feu vert des autorités.

"Sur la base des données cliniques existantes, Celtura a été autorisé pour les enfants à partir de trois ans ainsi que pour les adultes de tous les groupes d'âges", indique Swissmedic, l'autorité suisse de régulation des médicaments, dans un communiqué.

"Les données montrent également que, pour les adultes à partir de 40 ans, deux injections sont requises pour parvenir à une immunisation suffisante", poursuit le communiqué.

Swissmedic précise que dans ce cas le vaccin doit donc être administré à deux reprises, en respectant un intervalle de trois semaines.

Contrairement aux vaccins Focetria de Novartis et Pandemrix de GlaxoSmithKline déjà autorisés en octobre, le composant antigénique de Celtura n'est pas fabriqué sur la base d'oeufs embryonnés de poules mais d'une culture cellulaire.

Le vaccin Celtura est produit à partir de cultures cellulaires à base de reins de chiens, ce qui permet une production plus rapide que par la méthode classique sur oeufs de poules.

La demande d'autorisation pour le Celtura avait suscité un début de polémique dans la presse helvétique.

Citant une source anonyme proche du dossier, le quotidien Tages-Anzeiger avait affirmé le 23 octobre que des contaminations par des bactéries avaient été relevées dans les lots testés par Swissmedic. Deux jours après, Novartis avait démenti cette information.

Aucune autre demande d'autorisation de vaccin pandémique H1N1 n'a pour l'instant été soumise à Swissmedic.

Swissmedic gives surprise approval to Celtura swine flu jab

The Swine Flu, 14 November 2009, 14:10
https://web.archive.org/web/20100102035827/http://theflucase.com/index.php?option=com_content&view=article&id=1799%3Aswissmedic-gives-surprise-approval-to-celtuta-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The Swiss government drug regulator Swissmedic gave surprise approval Friday to the swine flu jab Celtura manufactured by Novartis.

According to reports in the Tagesanzeiger, the approval for Celtura had hit the rocks because of a lack of clinical safety data and trace of contamination.

The decision to give approval to Celtura on the basis of so little data on safety will fuel fears that key government authorities are collaborating with pharma to rush through untested swine flu jabs.

Celtura appears to be a repacked form of the drug Aflunov/Fluad H5N1 which had to be withdrawn from the European market authorisation process because it apparently killed many people in Poland in trials in 2008.

Grippe porcine: un troisième vaccin, le Celtura, est autorisé

SWI, 13 Novembre 2009, 15:41
https://www.swissinfo.ch/fre/grippe-porcine-un-troisi%C3%A8me-vaccin-le-celtura-est-autoris%C3%A9/1332530

(Keystone-ATS) Berne – Un troisième vaccin pourra être utilisé contre la grippe A(H1N1). L'institut Swissmedic a autorisé le Celtura, fabriqué par Novartis.

Contrairement aux vaccins Focetria et Pandemrix déjà autorisés en octobre, le composant antigénique de Celtura n'est pas fabriqué sur la base d'oeufs embryonnés de poules mais d'une culture cellulaire. Ce procédé de fabrication est inédit, a indiqué Swissmedic.

Celtura a été autorisé pour les enfants à partir de trois ans ainsi que pour les adultes de tous les groupes d'âges. Pour les plus de 40 ans, deux injections sont requises pour parvenir à une immunisation suffisante. Le vaccin doit donc être administré à deux reprises, en respectant un intervalle de trois semaines.

Aucune autre demande d'autorisation de vaccin contre la grippe pandémique n'a pour l'instant été soumise à Swissmedic.

THE FLU CASE

UAE makes swine flu jab compulsory for pilgrims going to Mecca

The Flu Case, 13 November 2009 17:14
https://web.archive.org/web/20100102031521/http://theflucase.com/index.php?option=com_content&view=article&id=1778%3Auae-makes-swine-flu-jab-compulsory-for-pilgrims-going-to-mecca&catid=1%3Alatest-news&Itemid=64&lang=en

The United Arab Emirates (UAE) has made it mandatory for all its citizens travelling to Saudi Arabia on the Hajj pilgrimage to be vaccinated against the swine flu. The UAE Ministry of Health set up 30 medical centers in the Northern Emirates and four in Dubai and Abu Dhabi, including one at the international airport.

Saudi Arabia has not made it mandatory for pilgrims to be vaccinated against the swine flu. Saudi authorities expect around three million foreign pilgrims an additional one million domestic travelers to visit Mecca in late November. They are taking precautionary measures: establishing isolation centers, organizing drugs and vaccines, arranging cars to transport infected patients, allocating doctors and nurses.

Pilgrims will also be provided bags containing disinfectants, medicines and guidelines for disease prevention.

FDA chief defends H1N1 vaccine supply

Reuters, 13 November 2009, 6:55 AM GMT+8
https://www.reuters.com/article/idUSTRE5AB574/

New York (Reuters) – The head of the U.S. Food and Drug Administration defended the agency's decision not to use an additive that could have stretched swine flu vaccine supplies, adding that doses should be coming more regularly.

The vaccine to prevent the H1N1 strain of influenza has been in short supply following production issues but more doses are becoming available, FDA Commissioner Margaret Hamburg said on Thursday at the Reuters Health Summit in New York. – "The gap between need and availability is narrowing. I think we are going to see doses coming off the lines and into people's arms or noses on a regular basis now," Hamburg said.

U.S. health officials have been scrambling to get the swine flu vaccine to market after the virus emerged too late to be included in this year's regular seasonal flu version. Initially, officials said there would be enough for everyone, but the public quickly grew frustrated when supplies ran short.

The FDA has approved H1N1 vaccine from five makers who already produce seasonal flu vaccine – GlaxoSmithKline Plc, AstraZeneca Plc's MedImmune unit, Novartis, Sanofi-Aventis, and CSL Limited. Both products use an egg-based technology to produce the vaccine, but the H1N1 virus grew slower than expected in the eggs, Hamburg said. She added the agency is working with manufacturers to move toward other, more efficient technology such as cell-based cultures that could spur production.

Hamburg said it was not too late for people to benefit from immunization.

Some experts have suggested the government could have increased supplies by embracing adjuvant vaccine technology that is widely used in Europe.

Adjuvanted vaccines contain an additive to boost the immune system response and need less of the active ingredient than the unadjuvanted types approved by the FDA. But Hamburg said they have not been widely tested and that the agency did not want to risk using them when standard vaccines worked well with a single dose. – "Had the shape of epidemic or the characteristics of the virus and the disease required it, we would have moved toward an adjuvanted approach," she said.

"Europe took a little bit more of a risk. Yes, there was experience with an adjuvanted vaccine but it was really only used in the elderly and there wasn't experience with that vaccine in other populations, including pregnant women and children."

Still, people remain wary of vaccine supplies and the public outcry has prompted the White House to look into the issue. It is still somewhat unclear when enough vaccine will become available to patients to meet demand.

Earlier on Thursday, Centers for Disease Control and Prevention officials said they had expected 8 million H1N1 vaccine doses this week but that they are unsure how many they will get. Hamburg, who took office in May, said that while the government may have over-promised on the availability of the vaccine earlier this year, lessons had been learned. – "We are also going to be better-prepared the next time around," she said. As for her own family, Hamburg said it was surprisingly easy to get her own children vaccinated. – "I just called my pediatrician's office ... and they said 'We have it. just come in,'" she said. "I just walked in on a Saturday morning with my kids, and they got it. No wait. No complications."

Le Télégramme

Grippe A.À Le Foll, 10% du personnel vacciné

Le Telegramme, 13 Novembre 2009 à 00h00

https://www.letelegramme.fr/cotes-d-armor/saint-brieuc-22000/spangrippe-aspana-le-foll-10-du-personnel-vaccine-685829.php

Depuis dix jours, le personnel del'hôpital Yves-LeFoll peutse faire vacciner contre lagrippeA. Cen'est pas encore la grosse affluence...

Marie-Louise Faramus, infirmière, attend les candidats à la vaccination parmi le personnel de l'hôpital. Les Drs Vaucel (à gauche) et Beuscart sont déjà passés sous sa seringue...

On en entend parler depuis si longtemps qu'on avait fini par la prendre pour un mythe... Mais la grippe A est bien là. Dans le département, une dizaine de cas ont été, pour l'instant, confirmés. «Mais c'est en train de se précipiter. Le nombre de tests positifs augmente de façon importante», précise le Dr Jacques Vaucel, à l'hôpital. Ce biologiste est responsable de la lutte contre les maladies nosocomiales dans l'établissement. Il forme avec le Dr Claude Beuscart, chef du service «maladies infectieuses», et avec Hélène Colas, directrice adjointe, le trio opérationnel du plan «anti-grippe A». Tandis que les centres de vaccination tout public ouvraient hier, dans toute la France (lire par ailleurs), ils organisent, depuis le 2novembre, la prophylaxie à l'égard du personnel hospitalier. Avec 2.700 salariés, l'hôpital Yves-Le Foll est une vraie ville, dont, pour l'instant, les «habitants» n'ont pas répondu massivement à l'invitation.

La moitié des médecins

«Nous avons pratiqué 290 injections, sur un peu plus de 10% du personnel. C'est conforme à la moyenne nationale», soulignait, hier, le Dr Beuscart. Directeur adjoint chargé de la communication, Bertrand Barbançon met en relief une certaine hiérarchie dans la collaboration. «Nous avons vacciné une centaine des 190médecins à temps plein de l'établissement, nettement moins d'infirmières, encore moins d'aides-soignants et les agents de service sont les derniers à se sentir concernés», souligne-t-il. «C'est important de savoir que les gens les plus qualifiés se mobilisent».

Responsabilité

«Se faire vacciner, c'est se protéger soi-même, mais aussi protéger ses proches et ses patients fragilisés. C'est aussi faire le maximum pour assurer la continuité du service public hospitalier. C'est une question de responsabilité», énonce le Dr Beuscart. «On aurait pu rendre la vaccination obligatoire pour le personnel de santé. C'est un choix politique qui n'a pas été retenu. Après tout, nous sommes en démocratie...», observe le chef de service. Reste que, pour enrayer efficacement une épidémie, il faut vacciner 70% de la population. «On en est loin», remarque le DrVaucel. Différentes sources annoncent le pic de l'épidémie pour la mi-décembre: cela laisse le temps à chacun de réfléchir.

Des réticences

Selon le Dr Beuscart, les réticences seraient entretenues par «une campagne des lobbies anti-vaccins». «C'est vrai qu'on n'a pas de recul sur ce vaccin, mais quand on en aura, l'épidémie sera passée. Ses composants sont parfaitement connus: du virus inactivé, donc incapable de transmettre la maladie, et des adjuvants qui en améliorent l'efficacité». Il ne le cache pas, dans l'établissement même, certains médecins sont hostiles à la vaccination. Le Dr Vaucel partage le point de vue de son confrère sur la nécessaire adhésion du personnel hospitalier, mais il est moins catégorique sur une vaccination massive de la population. «Ce vaccin n'est efficace qu'à 70%», fait-il remarquer. «Beaucoup de personnes nées avant 1957 sont immunisées par la circulation ancienne de virus voisins. Donc, ce sont les jeunes qui seront les plus touchés. Il faut donc qu'ils se sentent concernés», avertit Bertrand Barbançon.

THE FLU CASE

About 1.2% of Austrians take swine flu jab in first week

The Flu Case, 14 November 2009, 14:25
https://web.archive.org/web/20100102041523/http://theflucase.com/index.php?option=com_content&view=article&id=1801%3Aabout-12-of-austrians-take-swine-flu-jab-in-first-week&catid=1%3Alatest-news&Itemid=64&lang=en

According to the Austrian newspaper, the Kurier, about 100,000 people have taken the swine flu jab since Monday, representing about 1.2% of the total population of 8,300,000.

30,000 people took the jab in the first week in Vienna, about 2% of the population of 1,600,000, says the local media.

The figures are low if you consider the huge amount of swine flu scare stories that currently saturate Austria's mainstream media. If the newspapers are not telling us how lethal the swine flu virus is, they are reporting the Baxter swine flu jab is in such short supply and so much in demand that queues are forming to get it.

What the Austrian newspapers don't report, however, is that Baxter contaminated 72 kilos of seasonal flu with the live bird flu virus in February and so nearly triggered a global bird flu pandemic. Because Baxter has to adhere to biosafety level 3 regulations, the contamination was almost certainly deliberate.

ALEX JONES' INFOWARS.COM BECAUSE THERE IS A WAR ON FOR YOUR MIND

H1N1: Fact or Fiction?

Infowars, 14 November 2009
https://web.archive.org/web/20091116070704/http://www.infowars.com/h1n1-fact-or-fiction/

It's been about six months since the Department of Health and Human Services and the Secretary of Homeland Security followed the World Health Organization and declared a very scary pandemic influenza public health emergency in the United States.[1]

Last spring we suddenly found ourselves watching You Tube videos of people being quarantined in hotels and detained on airplanes by HazMat teams.[2] When we went to the grocery stores, we encountered fellow Americans wearing face masks.[3] And every time we turned on the television, there were news reports about schools closing so desks and lockers could be scrubbed down.[4]

The Worst is Yet to Come?

And we watched CDC press conferences[5] warning us that the worst was surely yet to come because the H1N1 swine flu virus first identified outside a pig farm in Mexico had the potential to mutate and kill tens of thousands more Americans[6] than the 36,000 that CDC officials tell us die every year from seasonal influenza.

It was enough to make us very, very afraid.

No Liability for Vaccine Makers

It was enough to make Congress give drug companies more than a billion dollars of our taxes to quickly create H1N1 swine flu vaccines[7] and then throw in another couple of billion dollars for health officials to deliver and aggressively promote vaccination in Sesame Street ads[8] and on the internet and radio and TV. And while they were at it, Congress shielded everyone who has anything to do with making, promoting and giving swine flu vaccines from all liability in civil court whenever somebody gets hurt or dies after getting vaccinated.[9]

It was enough to make us very, very afraid.

Health Worker Mandates & School Vaccination Programs

It was scary enough to make legislators in Massachusetts and other states talk about passing stronger laws to suspend civil liberties and force people to be quarantined or vaccinated whenever a public health emergency was declared.[10] It was scary enough to prompt New York state health officials to mandate that health care workers get seasonal and H1N1 influenza shots or be fired.[11]

And then there were calls by public health officials for children to line up and get vaccinated in schools[12] just like in the polio mass vaccination campaigns of the 1950's and early 60's.

Older Americans Have Antibodies to H1N1 Swine Flu

Throughout the summer, we were told that H1N1 swine flu was sweeping through the country[13] and millions of us had already been infected with the new virus and pregnant women and children were dying.[14] Curiously, many Americans over 60 were told they didn't need H1N1 vaccine because we were still protected by antibodies we got when we recovered from being infected with similar H1N1 flu strains in the past.[15,16]

Drug Companies Want Adjuvants, No More Eggs

And then, the vaccine manufacturers, who had been pressing the FDA for decades to let them use reactive squalene adjuvants[17] in vaccines, started complaining that they couldn't grow the H1N1 virus fast enough.[18] The threat of vaccine shortages suddenly loomed on the horizon.

The drug companies complained that they didn't want to use chicken eggs anymore to make flu vaccines. They wanted the FDA to let them use insects[19] and e coli bacteria[20] and fungus[21] and virus like protein particles[22,23] and dog kidney cells[24] and other really, really interesting stuff.

This is an EMERGENCY they said and drug companies need to be allowed to make flu vaccine any way they want to right now because this is a really serious public health emergency.[25] And, oh by the way, let's not forget that it is so serious that everyone who has anything to do with making, promoting and giving new flu vaccines need to be shielded from liability in civil court if people get hurt or die after getting vaccinated.

Yes, it was enough to make us all very, very afraid.

H1N1 Swine Flu Looks Like Seasonal Flu

And when we are really afraid, we don't think we have time to ask questions or double check the facts. We just want someone to tell us what to do right now so we can feel safe and not afraid anymore.

By the end of the summer, while the drug companies and NIH were testing the new H1N1 vaccines on several thousand healthy American children and adults,[26,27] reports started coming out of Australia and the southern hemisphere where they had just finished their influenza season, that the H1N1 swine flu virus was really not so bad after all.[28,29] It was not causing excess mortality, which means there weren't more people dying from H1N1 than had died in years past from other seasonal flu strains.

Yes, people were getting sick with what looked like influenza just like they do every year but – for most people – it was a few days of fever, chills, body aches, runny nose and cough, maybe some diarrhea, staying in bed, drinking lots of water and juice, and then – feeling just fine again.

CDC Stops Confirming Most Suspected H1N1 Cases

Abruptly at the end of July – when the Secretary of Health quietly extended the national public health emergency declaration for three more months – the CDC announced they were not going to lab confirm suspected cases of H1N1 swine flu anymore.[30,31] The CDC told the states not to test Americans who were flooding doctors offices and hospitals with symptoms of influenza and confirm that they WERE in fact suffering from type A or B influenza, especially H1N1 swine flu. The story was – if it looks like influenza then it IS influenza and can be ASSUMED to be H1N1 swine flu.[32]

Really? Is that how the CDC "scientifically" calculates how many Americans die from regular influenza every year?

Two to Four Flu Shots For Many Young Children

The decision to stop testing for H1N1 was followed by an announcement that all children between the ages of 6 months and 10 years – who had never gotten a flu shot before – should get 4 doses of influenza vaccine this year: two seasonal flu shots and two doses of H1N1 vaccine. Further, that the millions of chronically ill and disabled children and adults and also pregnant women should be the first in line to get two shots of influenza vaccine this year.[33]

And then Americans, who were still very afraid, started asking questions because most of us, who got sick with flu-like symptoms this year, realized that it was no worse than the flu we got last year. And most of us didn't know anyone who had died from the flu this year, which was true for most other years as well.

Two to Four Doses of Mercury?

And then we started asking questions about why young children needed two to four doses of influenza vaccine this year. And we thought – what is up with mercury still being in most vials of influenza vaccine? 34 We thought – is it really a good idea to give children – whose doctors don't have access to single dose vials of mercury free flu vaccine – two to four doses of mercury this year? Especially when it is against HazMat regulations to pour unused mercury containing influenza vaccine down the drain or toss it into a garbage can?[35,36]

Is It Influenza, Seasonal, H1N1 or None of the Above?

And then a veteran investigative journalist at a major news network published an interesting report about the fact that 83 to 97 percent of all specimens of suspected H1N1 cases sent to the CDC by state health departments for lab confirmation last spring and summer came back negative – for not only H1N1 swine flu influenza – but also negative for ANY kind of type A or Type B influenza. at all.[37] Which confirmed what the CDC's influenza expert said at an FDA meeting in 2003: that 80 percent of all flu-like illness every year is not actually influenza but viral and bacterial infections that LOOK like influenza.[38]

Wait a minute. Didn't President Obama stand up at a press conference in October and say that 1,000 Americans, including about 100 children, had died from H1N1 swine flu?[39]

But were those 1,000 H1N1 lab confirmed deaths or deaths that were ASSUMED by the CDC to be deaths caused by swine flu?

And how does that number of deaths compare with the 36,000 deaths that CDC officials say are caused by seasonal influenza every year?[40]

People Started Asking Questions

And then something unusual happened. Doctors started asking questions and privately some of them told their patients not to bother getting the H1N1 vaccine.[41] And the people, who were still being told by health officials to be very, very afraid, started to do their own research using the great new Library of the World, the internet. People started asking more questions of their government health officials – not just in America – but in Great Britain[42] and the Netherlands,[43] in Germany[44] and Italy,[45] in Poland[46] and in Canada[48] and many other countries.

And then the poll results started coming in revealing that about 50 percent of us were saying "yes" I want to get a swine flu shot and 50 percent of us were saying "No, thank you".[49,50]

Fear or Facts?

And that is where it stands today. Some of us are still very afraid and some of us are not.

I am reminded of a famous quote from Abraham Lincoln: You can fool some of the people all of the time and you can fool all of the people some of the time, but you can't fool all of the people all of the time.

New Vaccine Ingredients Calculator

And I would urge those of you who want to get seasonal or H1N1 vaccines, to go to the homepage of the website of the National Vaccine Information Center at www.NVIC.org and look at the new Vaccine Ingredient Calculator, which will tell you how much mercury is in those vaccines.

Support NVIC's Research & Public Education Programs

And I would urge those of you, who want better vaccine science and the right to make vaccine choices, to become a donor supporter of the National Vaccine Information Center's research and public education programs.

Truth and freedom are not free, especially when there are so many doing so much to limit the people's access to both.

THE FLU CASE

0.15% of French population take swine flu jab between October 21st and November 10th

The Flu Case, 14 November 2009 13:17

https://web.archive.org/web/20100102051418/http://theflucase.com/index.php?option=com_content&view=article&id=1795%3A015-of-french-population-take-swine-flu-jab-between-october-21st-and-november-10th&catid=1%3Alatest-news&Itemid=64&lang=en

About 100,000 people in France have taken the swine flu jab between October 21st and November 10th according to the Agence francaise de securite sanitaire des produits de sante.

This represents approximate 0.15% of the total French population which is estimated to be about 63,700.000 people.

http://www.afssaps.fr/var/afssaps_site/storage/original/application/913ccfbf3997e7d6cffc1c6fe395cc10.pdf

The case is being investigated by the Agence française de sécurité sanitaire des produits de santé. The agency says 91 adverse events have been reported, including four serious reactions and a case of GBS.

YAHOO! DEUTSCHLAND NACHRICHTEN

Bundestagsabgeordnete werden ab Ende November geimpft

Yahoo! Deutschland, AP, 14 November, 14:19 Uhr
https://web.archive.org/web/20091116171455/http://de.news.yahoo.com/1/20091114/thl-bundestagsabgeordnete-werden-ab-ende-5e422d2.html

Frankfurt/Main (AP) Bundestagsabgeordnete und ihre Mitarbeiter sollen von Ende November an gegen die Schweinegrippe geimpft werden. Ein Sprecher des Bundestags bestätigte am Samstag der Nachrichtenagentur AP einen «Spiegel»-Bericht über eine entsprechende Hausmitteilung. Der Parlamentsarzt führe die Impfungen der Abgeordneten durch, sofern sie gewünscht seien, sagte der Sprecher. Nach anfänglicher Zurückhaltung steigt die Impfbereitschaft der Bundesbürger angesichts der immer größeren Verbreitung der Krankheit deutlich, wie aus Umfragen des Magazins «Focus» hervorgeht.

«Der Spiegel» berichtete, die Bundestags-Mitarbeiter seien in der Hausmitteilung aufgerufen worden, sich werktags zwischen 09.00 Uhr und 13.00 Uhr im Sanitätsraum des nahe gelegenen Paul-Löbe-Hauses einzufinden. Die Impfung sei grundsätzlich «allen Personen» empfohlen, heiße es.

Bundesgesundheitsminister Philip Rösler hatte am Mittwoch erklärt, die Zahl der zur Verfügung stehenden Impfdosen mache deutlich, «dass nicht jeder geimpft werden kann». Bund und Länder hielten sich deshalb an die Empfehlung der Impfkommission, die einen stufenweise Immunisierung vorsieht. Danach sollen zunächst in Gesundheits- oder Sozialdiensten Beschäftigte sowie chronisch Kranke und erst dann die übrige Bevölkerung geimpft werden.

Der Umfrage im Auftrag von «Focus» zufolge stieg die Zahl der Impfwilligen im November auf 21 Prozent, verglichen mit 14 Prozent im Oktober. Nicht impfen lassen wollen sich danach 67 Prozent (Oktober: 78 Prozent). Die Institute Polis-Sinus und usuma befragten 1.012 beziehungsweise 1.002 Bundesbürger.

Weiter berichtete «Focus» unter Berufung auf das Paul-Ehrlich-Institut, dass bis Anfang der abgelaufenen Woche bei 59 Personen Verdachtsfälle von unerwünschten Reaktionen nach der Schweinegrippe-Impfung gemeldet worden seien. Der jüngste Impfling mit Beschwerden war 16, der älteste 77 Jahre alt.

Am häufigsten wurden Lokalreaktionen an der Injektionsstelle wie Rötung oder Schwellung und Allgemeinreaktionen, die bekanntermaßen nach einer Impfung auftreten können (zum Beispiel Kopfschmerzen, Fieber, Müdigkeit, Muskel- oder Gliederschmerzen, Übelkeit, Lymphknotenschwellung) genannt. In wenigen Fällen kam es zu schweren allergischen Reaktionen oder Kreislaufbeschwerden. «In keiner Meldung wurde über einen tödlichen Ausgang oder über einen bleibenden Schaden berichtet», heißt es beim Paul-Ehrlich-Institut weiter.

German MPs told to line up for the "swine flu" jab from end of November

The Flu Case, 14 November 2009 13:03
https://web.archive.org/web/20100102053401/http://theflucase.com/index.php?option=com_content&view=article&id=1793%3AGerman-mps-told-to-line-up-for-the-qswine-fluq-jab-from-end-of-november&catid=1%3Alatest-news&Itemid=64&lang=en

German MPs and their staff are to get the swine flu jab from the end of November, according to an AP report. The doctor responsible for looking after the peole who work in the German Parliament is to carry out the vaccination programme. MPs have been told to report to the health care unit attached to Parliament between 9 am and 1 pm for their swine flu jab, which is recommended bascially to "all people", according to a government spokesperson.

THE FLU CASE

BAG-Chef kritisiert Kantönligeist bei Impfaktion

The Flu Case, 14 November 2009
https://web.archive.org/web/20100102031140/http://theflucase.com/index.php?option=com_content&view=article&id=1794%3Aswiss-health-ministers-criticises-cantons-over-swine-flu-jab-programme&catid=1%3Alatest-news&Itemid=64&lang=en

Angesichts der grossen kantonalen Unterschiede bei der Impfung gegen die Schweinegrippe wirft BAG-Direktor Thomas Zeltner die Frage auf, ob das föderale Vorgehen Sinn macht. Für künftige Impfwellen möchte er über eine Zentralisierung diskutieren.

BAG-Direktor Zeltner: Grosse kantonale Unterschiede bei der Impfung gegen die Schweinegrippe. (reuters)

«Wir werden nach dieser Impfwelle wirklich mit den Kantonen zusammen sitzen müssen und die Für und Wider dieser kantonalen Vorgehensweise anschauen müssen.»

Dies sagte der Direktor des Bundesamtes für Gesundheit (BAG) in der Sendung «Heute Morgen» von Radio DRS vom Samstag.

Tempo und Vorgehen wirft Fragen auf

Es habe sich gezeigt, dass die Unterschiede zwischen den Kantonen bezüglich Tempo und Vorgehensweise Fragen aufwärfen, die man mit den Kantonen prüfen wolle. Als Alternative komme fast nur eine Zentralisierung in Frage, sagte Zeltner im Radio-Interview. Oder aber eine Regionalisierung: «Man könnte allenfalls mehrere Kantone zusammennehmen nach den Regionen der Gesundheitsdirektorenkonferenz.»

Allerdings, sagte der BAG-Direktor, wolle er die Kantone jetzt erst einmal die laufende Impfaktion zu Ende führen lassen, bevor man über neue Organisationsformen spreche.

Swiss Health Ministers criticises Cantons over swine flu jab programme

The Flu Case, 14 November 2009, 13:08
https://web.archive.org/web/20100102031140/http://theflucase.com/index.php?option=com_content&view=article&id=1794%3Aswiss-health-ministers-criticises-cantons-over-swine-flu-jab-programme&catid=1%3Alatest-news&Itemid=64&lang=en

The Director of the Swiss Health Ministry, Thomas Zeltner, has critised the Cantons for not doing more to carry out the swine flu vaccination programme and has threatened to reorganise the health system so that vaccination campaigns are carried out by a central, federal body, according to Swiss TV.

Switzerland is split into many cantons or federal states that have a strong tradition of direct democracy and a final say in local affairs.

Dringende Arzneimittel-Meldung

ABDA, 16 November 2009.
https://web.archive.org/web/20091121125555/http://www.abda.de/2400.html

AMK-PHAGRO-Schnellinformation an alle öffentlichen Apotheken
Bitte sofort weiterleiten!
Herstellungsanweisung von Pandemrix® Impfstoff genau beachten!

Der Arzneimittelkommission der Deutschen Apotheker (AMK) sind zwei Fälle bekannt geworden, bei denen nach der Vermischung der beiden Komponenten des Pandemrix® Impfstoffes (Suspension/Antigen mit Emulsion/Adjuvans) zur gebrauchsfertigen Mischung Fremdpartikel beobachtet wurden.

Zur genauen Beurteilung hat die AMK veranlasst, dass diese Proben im Zentrallaboratorium Deutscher Apotheker (ZL) untersucht werden.

Die AMK weist, in Abstimmung mit GlaxoSmithKline GmbH & Co. KG, München, darauf hin, dass die Anweisungen der Fach- bzw. Gebrauchsinformation von Pandemrix® insbesondere zum Vermischen und zur Anwendung des Impfstoffes (Abschnitt 6.6 der Fachinformation (Stand September 2009) bzw. abtrennbare Informationen des unteren Teiles der Gebrauchsinformation) genau eingehalten werden müssen.

Die AMK bittet, die Anwender von Pandemrix® besonders auf die folgenden Anweisungen für das Vermischen und die Anwendung des Impfstoffes hinzuweisen:

"Vor dem Vermischen der beiden Komponenten sollten die Suspension und die Emulsion Raumtemperatur erreicht haben, geschüttelt werden und per Augenschein auf etwaige Fremdpartikel und/oder physikalische Veränderungen untersucht werden. Falls solche beobachtet werden, ist der Impfstoff zu verwerfen."

Nach Entnahme der beiden Komponenten aus dem Kühlschrank wird Raumtemperatur voraussichtlich nach 30 Minuten erreicht. Dieser Zeitraum der Erwärmung ist u. a. notwendig, damit der Gummistopfen der Durchstechflasche elastischer wird und beim Einstechen der Kanüle keine Stopfenpartikel ausgestanzt werden.

Wir bitten, Verdachtsfälle auf unerwünschte Wirkungen im Zusammenhang mit der Anwendung von Influenzaimpfstoffen per Berichtsbogen an die AMK zu melden.

Eschborn, 16.11.2009

Foreign particles observed in Pandemrix vaccine in Germany, sent to lab for tests

The Flu Case, 19 November 2009, 20:39
https://web.archive.org/web/20100102010311/http://theflucase.com/index.php?option=com_content&view=article&id=1978%3Aforeign-particles-observed-in-pandemrix-vaccine-in-germany-sent-to-lab-for-tests&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The German Medicine Products Commission of German Pharmacists (AMK) has issued an urgent report warning that foreign particles have been observed on two occasions when the components of GlaxoSmithKline's Pandemrix swine flu vaccine - the antigen suspension and adjuvant emulsion – have een mixed.

The AMK has sent samples to the Central Laboratory of German Pharmacists to be investigated.

Unis Face au Vaccin H1N1

Jean-Bruno Roumegoux

New rules make the swine flu jab voluntary, reports
L'obligation vaccinale pour les gendarmes a été levée!

Unis face au Vaccin, 16 Novembre 2009, 03:13
http://www.unisfaceauvaccin.org/index.php/actualites/activisme/265-lobligation-vaccinale-pour-les-gendarmes-a-ete-levee-.html (deleted)

Communiqué du groupe Facebook *Contre La Vaccination Obligatoire De Nos Gendarmes*!

Le groupe Facebook *Contre La Vaccination Obligatoire De Nos Gendarmes* administré par Jean-Bruno Roumegoux, remercie la Direction générale de la gendarmerie nationale pour son nouveau positionnement concernant la vaccination A/H1N1 des personnels civils et militaires depuis la circulaire 106084 du 8 septembre 2009, stipulant que les personnels de la gendarmerie «sont tenus de se soumettre à la vaccination A/H1N1».

Conformément au Code de la santé publique, Art L. 1111-4 : «Aucun acte médical, ni aucun traitement ne peut être pratiqué sans le consentement libre et éclairé de la personne» et par message du 6 novembre 2009, le Chef du Bureau du Renseignement de la Direction générale de la gendarmerie nationale S.O.E / S.D.D.O.P confirme «que le plan de vaccination des personnels civils et militaires de la gendarmerie nationale a été suspendu. Parallèlement, de nouvelles dispositions internes, visant à soumettre la vaccination A/H1N1 au strict volontariat et à en préciser les modalités pratiques, sont en cours de signature au niveau des plus hautes autorités de la gendarmerie nationale».

Felicitations a Chacun D'entre Vous pour son engagement et pour cette avancée majeure pour nos gendarmes. Ce groupe a rassemblé des membres de toutes sensibilités sur cette cause humaine et de bon sens. Le groupe devient L'Observatoire National des Vaccinations. Bienvenue à celles et ceux qui voudraient continuer cette aventure de réflexion, de communication et d'action concernant les pratiques vaccinales en France. ENCORE MERCI, TRES SINCERES AMITIES!

THE FLU CASE

Swine flu jab no longer compulsory for French Gendarmes following protests

The Flu Case, 16 November 2009, 10:45
https://web.archive.org/web/20100102043131/http://theflucase.com/index.php?option=com_content&view=article&id=1820%3Aswine-flu-jab-no-longer-compulsory-for-french-gendarmes-following-protests&catid=1%3Alatest-news&Itemid=64&lang=en

Plans to force every single member of the French rural police force, the Gendamerie, as well as their families to take the untested swine flu jab have been shelved following protests.
According to a report by the Facebook group "Against the compulsory vaccination of our Gendarmes", the head of the Bureau du Renseignement de la Direction générale de la gendarmerie nationale S.O.E / S.D.D.O.P, has confirmed that "the plan to vaccinate the civilian and military personnel of the Gendamerie have been suspended."

Medizinhistoriker über Schweinegrippe:
"Seuchenzeiten fördern Misstrauen"

TAZ, 17 November 2009

https://taz.de/Medizinhistoriker-ueber-Schweinegrippe/!5152414/

Schon eine bislang harmlose Grippeepidemie versetzt viele Bürger in Angst. Wie groß wäre da die Panik bei einer echten Seuche? Der Medizinhistoriker Klaus Bergdolt über zutiefst menschliches Verhalten.

TAZ: Herr Bergdolt, niemand scheint zu wissen, wie schlimm H1N1 wirklich ist. Die Öffentlichkeit ist verwirrt. Wären wir im Ernstfall genauso panisch wie die Menschen zu Zeiten der Pest vor 660 Jahren?

Klaus Bergdolt: Würde sich die Schweinegrippe zu einer für viele Menschen tödlichen Epidemie entwickeln, dürfte sich, das steht leider zu befürchten, die Bevölkerung kaum anders verhalten als im 14. oder 15. Jahrhundert. Ungeachtet aller zivilisatorischen Brüche, die von Historikern immer wieder reklamiert werden, bleibt die bittere Erkenntnis: Seuchenzeiten sind Zeiten des Misstrauens, der Verdächtigung, der Vorurteile. Auch durch die Aufklärung hat sich hier wenig verändert. Im Gegenteil: Die Ausgrenzung wurde nur wissenschaftlich untermauert.

Warum?

Schon im 14. Jahrhundert versetzte das bloße Gerücht, in einer Nachbarstadt oder einem nah gelegenen Land grassiere die Pest, die Menschen in helle Aufregung. Wenn ich die öffentliche Thematisierung der Schweinegrippe in den vergangenen Wochen Revue passieren lasse, habe ich den Eindruck, dass ein Teil der Presseberichte ganz ähnliche Ängste weckt. Hier geht etwas nicht auf: Jedes Jahr sterben tausende Menschen hierzulande an normalen Grippeinfektionen, ohne dass groß darüber berichtet wird. Aber jeder einzelne Todesfall, der der Schweinegrippe zugerechnet wird, wird in Schlagzeilen herausgestellt.

Liegt das nicht auch an der Sorge, der Erreger der Schweinegrippe könne zu einer weitaus gefährlicheren Variante mutieren?

Natürlich. Es ist tatsächlich beunruhigend, dass zum Beispiel die Spanische Grippe nach dem Ersten Weltkrieg, an der mehr Menschen starben, als Soldaten im gesamten Krieg gefallen waren, erst durch eine solche Mutierung gefährlich wurde. Im Moment gibt es für so etwas aber keine Anzeichen. Fast alle Fälle verlaufen harmlos. Die wenigen Todesfälle beschränken sich auf Risikogruppen.

Trennt uns also heute von einer Weltuntergangsstimmung wie zur Zeit des "Schwarzen Todes" nur ein dünner Firnis aus Hygienebestimmungen?

Uns trennt vieles von den Menschen des Spätmittelalters, die fast ausnahmslos sehr religiös waren. Der Tod bedeutete etwas anderes als in der säkularen Gesellschaft. Viel interessanter ist aber, was uns mit dieser Zeit verbindet. Das 14. Jahrhundert war eine Zeit mentaler Veränderungen. Die Sicherheit der Weltordnung wurde brüchig, Zweifel kamen auf. Der Schwarze Tod wurde, denken wir nur an Petrarca, auch eine Art Metapher des Umbruchs.

Gerade in Deutschland zeichnen sich ja auch heute radikale mentale Veränderungen ab. Wir sind auf dem Weg zu einer säkularen Gesellschaft, die eigene kulturelle Traditionen stark relativiert. Viele Menschen leiden an einer Identitätskrise. Wie man, nach fast einem Jahrhundert seuchenpolitischer Stabilität, einer kollektiven Seuchengefahr begegnet, darüber haben wir keine Erfahrungen. Ich fürchte, die Menschen würden sich im Fall einer Katastrophe nicht weniger hilflos fühlen als 1348.

Sind wir heute einem Inferno wie der Pest besonders nahe, weil ein Virus binnen weniger Tage um die Welt reisen kann? Oder sind wir dank Impfungen, Erfahrung und Hygiene besonders geschützt?

Niemand kann diese Fragen sicher beantworten. Wenn wir Glück haben, bleibt die Schweinegrippe eine harmlose Epidemie mit wenigen Opfern. Falls der Erreger jedoch mutiert, könnte eine ähnlich gefährliche Seuche wie nach dem Ersten Weltkrieg drohen. Absoluten Schutz bietet dann nur, wie 1348, die absolute Isolation. Das wird nur wenigen möglich sein.

Erklärt das auch die missverständlichen Signale der Gesundheitsbehörden? Mal wird beschwichtigt, mal gewarnt.

Die Regierung ist natürlich in einer schwierigen Situation. Die Gesundheitsbehörden müssen einerseits auf den Ernstfall gut vorbereitet sein, andererseits alles vermeiden, was Unruhe erzeugen könnte. Zu Pestzeiten war das nicht anders. In einer ersten Phase wiegeln Behörden - das ist ein Gesetz der Seuchengeschichte - eher ab.

Noch einmal: Kann eine Panik in der heutigen säkularen Gesellschaft leichter entstehen als in der festgefügten Welt des Mittelalters?

Religiöse Menschen sahen in Seuchen eine Prüfung oder Strafe Gottes. Viele kümmerten sich aus christlicher Barmherzigkeit um Erkrankte und Sterbende, wobei man sogar das eigene Leben aufs Spiel setzte. Andere wurden bereits 1348 zu puren Egoisten. Schon damals reagierte man also höchst unterschiedlich.

Ich bezweifle, dass es heute eine nennenswerte Bereitschaft gibt, das Leben für Schwerkranke und Sterbende einzusetzen. Entgegen allen politisch korrekten Beteuerungen würde unsere Gesellschaft im Ernstfall vermutlich eine utilitaristische Abwägung treffen. Das Ergebnis wäre: Wer zu einer Minderheit gehört, welche die Mehrheit tödlich bedroht, muss isoliert werden.

Die Isolierung von Kranken gab es doch schon vor Jahrhunderten: in Lazaretten, Wohnhäusern oder durch Mauern. Das Habsburgerreich baute im 17. Jahrhundert sogar einen 1.900 Kilometer langen Gürtel von Wachen auf, um das Eindringen der Pest aus dem Osmanischen Reich abzuwehren.

Vor allem in großen Kommunen waren Pestlazarette alltägliche Einrichtungen. Dort wurden die Kranken vor allem von Pflegeorden betreut. Wer wollte diese Aufgabe heute übernehmen, falls - um den Worst Case herauszustellen - eine pestartige tödliche Seuche wie Schnupfen durch Tröpfcheninfektion übertragen würde? Aber noch einmal: Im Moment kann von einer solchen Seuche keine Rede sein.

Auch jüngere Seuchen brachte "Helden" hervor: Alexander Fleming entwickelte das Antibiotikum Penicillin, Robert Koch entdeckte das Cholera-Bakterium, und der Immunologe Paul Ehrlich fand ein Mittel gegen die Syphilis. Fehlt heute, da anonyme Konzerne Wirkstoffe entwickeln, vielen Menschen ein benennbarer Held?

Bei der Schweinegrippe fällt der wissenschaftliche Held offensichtlich aus. Ein perfektes Mittel gegen diese Erkrankung wird es vermutlich erst geben, wenn die Gesellschaft sich schon mit der nächsten Seuche befasst.

Auch ein benennbares Böses, das schuld ist an der Seuche, gibt es heute nicht mehr.

Genau das macht die Sache vielen Menschen unheimlich. Die bildhafte Vorstellung des Bösen ist auf der Strecke geblieben.

Früher galten Seuchen als Strafe Gottes. Und heute?

Religiöse Erklärungen spielen, wie gesagt, kaum noch eine Rolle, moralisierende dagegen sehr. Die Verbreitung der Seuchen wird dann als Folge der neuen Mobilität, des Tourismus, des westlichen Luxus allgemein erklärt. Da kommt man schnell zu dem Schluss, dass die Natur nun etwas "korrigieren" müsse. Solche Vorstellungen gab es schon im 19. Jahrhundert.

Wächst wieder die Lust an der Endzeitstimmung, ähnlich dem Schauder vorm Atomkrieg?

Von der Angst während der sogenannten Nachrüstungsdebatte - man denke an die Proteste gegen die Aufstellung von Atomraketen - sind wir noch ein ganzes Stück entfernt. Die Menschen erscheinen mir weitaus gelassener, und das ist gut so. Im Vergleich zur Zeit der Pest haben wir - statistisch gesehen - ja auch einen Vorteil, nämlich die Möglichkeit zur Impfung.

Ausgerechnet dort gibt es heftigen Streit zwischen Impfbefürwortern und Impfgegnern.

Das Problem ist, dass einerseits die Behörden zur Impfung aufrufen, die Experten aber unterschiedliche Meinungen über deren Sinn und Nutzen äußern. Auch dass zwei verschiedene Impfstoffe bestellt worden sind - der eine für Mitarbeiter von Regierungen und Behörden, der andere für Normalbürger -, war zwar eine rein praktische Maßnahme ohne Hintergedanken, psychologisch aber eine unglaubliche Ungeschicklichkeit.

Impfgegner gibt es, seit es Impfungen gibt. Haben sich deren Argumente grundsätzlich gewandelt?

Im Kern nicht. Impfgegner berufen sich auf bestimmte Statistiken und verweigern andere Statistiken, die sie widerlegen würden. Es gibt ein uraltes Misstrauen gegenüber staatlichen Maßnahmen und naturwissenschaftlicher Medizin. Das war bereits im 18. Jahrhundert so. Aber man darf auch nicht vergessen: Es gibt immer wieder Menschen, die aufgrund einer Impfung schwer erkranken oder sogar sterben.

Lassen Sie sich gegen die Schweinegrippe impfen?

Es mag merkwürdig klingen: Ich habe mich noch nicht entschieden. Ich warte ab.

Salzburger Nachrichten

Derzeit gibt is im Landeskrankenhaus Salzburg eine Art sanfter "Impfzwang"

Salzburger Nachrichten, 17 November 2009, 10:21
https://web.archive.org/web/20100102014949/http://theflucase.com/index.php?option=com_content&view=article&id=1833%3Asalzburg-hospital-workers-and-visitors-told-wear-face-mask-or-get-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Nicht geimpfte Mitarbeiter (und Besucher) müssen ab sofort Schutzmasken tragen.

Wer schon einmal über längere Zeit unter echten Arbeitsbedingungen Schutzmasken tragen musste, weiß was ich meine - Es ist ein bisserl "Folter" - wennst es nicht gewöhnt bist.

Es ist also für jeden sofort ersichtlich, wer nicht geimpft (=verantwortungslos) ist.

Gibts eigentlich schon einen Test für die Neue Grippe - ob man vielleicht schon immun ist?

Bei vielen anderen Krankheiten gibts das!

Beispielsweise für Zecken-Gehirnhautentzündung! Da kann man sich gegen Bezahlung zumindest testen lassen, ob eine Impfung nötig ist.

Falls es diesen Impf-Dither für die Schweinegrippe gäbe - vielleicht sollten die "Zwangsopfer" des LKA solche Tests vor der Masken - Tragepflicht einfordern?

Ich kenne mittlerweise einige Angestellte des LKA- die sich gegen ihre Überzeugung impfen lassen werden, um der Maskentragepflicht zu entkommen.

Debatte "Salzburger Nachrichten" über Impfwilligkeit:
http://mein.salzburg.com/forum/debatte/2009/10/lassen-sie-sich-gegen-die-neue.html," emails Heimo.

THE FLU CASE

Salzburg hospital staff and visitors told: wear face mask or get jab

The Flu Case, 17 November 2009, 10:21
https://web.archive.org/web/20100102014949/http://theflucase.com/index.php?option=com_content&view=article&id=1833%3Asalzburg-hospital-workers-and-visitors-told-wear-face-mask-or-get-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Health care workers and visitors to the Salzburg Regional Hospital, Austria, have to wear protective masks if they have not had the swine flu jab under new regulations.

Heimo from Salzburg emails to say that he knows health care staff who are going to take the jab against their wishes just to avoid having to wear the uncomfortable protective masks during their work.

He asks if there is a test to see if you have developed anti bodies to the swine flu allowing an exemption from the swine flu vaccination obligation as is the case with other diseases.

However, as far as I know there is no reliable test to identify the swine flu, let alone the antibodies to it.

How long until the requirement to wear a mask or be injected with the swine flu jab spreads to other hospitals, offices and finally the streets of Austria?

US officials defend swine flu vaccination plan

Reuters, 17 November 2009, 12:25 pm GMT + 8
https://www.reuters.com/article/idUSN1774637/

Washington (Reuters) – U.S. public health officials defended the distribution of swine flu vaccines on Tuesday against criticism that their plan to protect Americans was confusing and over-optimistic.

Manufacturers have delivered 48.5 million doses of H1N1 vaccine, Dr. Anne Schuchat of the U.S. Centers for Disease Control and Prevention told a Senate hearing. HHS had hoped to have as many as 120 million doses by now.

The problem was worsened because the first vaccine to be available was a nasal spray made by AstraZeneca unit MedImmune that is not suitable for some of the most vulnerable groups but which is perfect for most schoolchildren and healthcare workers, officials said.

Members of the Senate Homeland Security and Governmental Affairs Committee pressed for an apology and said they felt President Barack Obama's administration had not learned some valuable lessons from the continuing problem.

"I am worried that we are undermining confidence in our public health system," said committee chairman, Connecticut independent Sen. Joseph Lieberman.

He said he feared people who have waited in vain to be vaccinated against H1N1 swine flu will stop trying.

"This hearing is critical to peeling away the layers of misinformation and miscommunication that has hampered the federal government's pandemic influenza strategy," added Maine Republican Senator Susan Collins.

The U.S. government is struggling to vaccinate as many people as possible against the virus, which has infected an estimated 22 million Americans and killed 3,900.

In September HHS Secretary Kathleen Sebelius had assured Congress, "There will be enough vaccines for everyone."

"I think we led expectations of availability to be higher than they have been. I think that led to frustration," Schuchat said.

Admitting Mistakes

"I think you used the word mistake and it is important to acknowledge that here," Lieberman said.

HHS spokeswoman Jenny Backus later said Sebelius's promise was not a mistake.

"The problem has been that lots of people want it all at the same time and that has been a challenge and we understand that people are frustrated," Backus said by email.

"Vaccine came off the production lines slower than what the original predictions were and we made the tough choice to start the vaccination program as soon as vaccine was ready to go even though we knew that supplies would be low."

The vaccination plan was chosen at a July meeting of the Advisory Committee on Immunization Practices, an independent group of experts that advises the CDC on vaccine policies.

They agreed to create five broad priority groups totaling 159 million people -- pregnant women, healthcare workers, people with asthma or other conditions that put them at high risk of flu complications, caregivers of infants too young to be vaccinated, and children and adults aged up to 24.

Lieberman said he thought HHS and CDC should have revised the priority groups downward to the 42 million people deemed most in need of vaccination, but Schuchat said the committee met again in October and decided not to modify its recommendations.

"What we heard pretty consistently was leave the flexibility to the state and locals. Let them decide," she said. Many wanted to run school-based clinics and narrowing the designated priority groups would have meant the most available vaccine – the spray – could not be broadly used.

Vaccin till små barn stoppas

Aftonbladet, 17 November 2009
https://web.archive.org/web/20091120175255/http://www.aftonbladet.se/nyheter/article6134559.ab

Förvirrade Tina Hyvönen med sonen Marcus, 11 månader, är förvirrad av reglerna. Enligt Läkemedelsverket kan sonen vaccineras – men barnavårdscentralen stoppade vaccineringen i går.

Varken föräldrar eller landsting vet vilka regler som gäller

Läkemedelsverket säger ja till influensavaccin för spädbarn över sex månader.

Men flera landsting satte i går stopp för de minsta.

– Förvirrande, säger mamman Tina Hyvönen, 41.

Hon bor i Kungsängen norr om Stockholm och har två barn. En dotter som går på en förskola där svininfluensan sprider sig som en löpeld. Och där hemma finns Marcus, elva månader.

Därför blev Tina Hyvönen glad när hon förra veckan läste att Socialstyrelsen och Läkemedelsverket gett klartecken för vaccinering av barn under tre år.

Fick ingen spruta

Nu blev det även möjligt för sonen att få sprutan.

– Han hade RS-virus när han var yngre som satte sig på lungorna. Så jag vet hur det är att ha en son som har svårt att andas. Därför har vi varit särskilt angelägna, säger Tina Hyvönen.

Hon var inte den enda föräldern som i går tog sig till Skogakyrkan i Kungsängen där barnavårdscentralen erbjöd vaccinering för de minsta.

Men efter en knapp timmes köande fick Marcus åka hem – utan någon spruta.

– När vi kom fram fick vi beskedet att de inte vaccinerar barn under ett och ett halvt år.

Överdriven oro

Verksamhetschefen Ingrid Berg anser att det måste utredas bättre hur vaccinet påverkar de minsta barnen. Flera andra landsting, bland andra Västerbotten, resonerar likadant.

– Vaccinet innehåller ägg, men många barn i den åldern har aldrig ätit ägg. Hur ska vi då kunna veta om de är äggallergiker?

Jan Liliemark, som är professor på Läkemedelsverket, tycker att oron är överdriven.

– Det kan eventuellt finnas restprodukter av ägg i vaccinet, därför ska man inte utsätta svåra äggallergiker för det.

– Att därifrån dra slutsatsen att inte vaccinera några spädbarn är att gå alldeles för långt.

THE FLU CASE

Swedish authorities argue with each other over vaccine safety. – The Flu Case, 17 November 2009.
https://web.archive.org/web/20100102012917/http://theflucase.com/index.php?option=com_content&view=article&id=1845%3Aswedish-authorities-argue-with-each-other-over-vaccine-safety&catid=1%3Alatest-news&Itemid=64&lang=en

Aftonbladet today reports that the new recommendations made by the Medical Products Agency in Sweden, to vaccinate children between the ages 6 months and three years with the poisonous Pandemrix "swine flu" vaccine are meeting resistance within the medical system's own ranks. The regional medical bodies in Sweden, the Landsting, does not seem to comply because of concerns about the safety of the vaccine in small children. "Vaccine for small children is stopped" reads the headline.

Several Landsting in Sweden refuse to let children that young get the vaccine. One official reason was mentioned to be concerns about egg allergies, which might not yet be known in such small children. A valid point but likely not the real reason for the refusal. This is the first sign in Sweden that the employees in the swedish medical system no longer want to play along with the massive "swine flu" vaccination campaign.

THE FLU CASE

New Zealand asks:
who signed the regulations that allow compulsory vaccinations by WHO?

The Flu Case, 17 November 2009.

Attention Dr Margaret Chan
Director-General
For World Health Organization
Avenue Appia 20
1211 Geneva 27
Switzerland

11 October 2009

Reminder Notice. Dear Dr Chan: With respect, your tacit assent would render your vaccine program void and illegal under the Crimes Act. **By fax at:** 23:38 on 18 Nov 2009
P.P. AA

Confirmation by fax to: 0041 22 791 31 11 at 13:36 Original by fast post. info@who.int.

Dear Dr Chan **Did the Signatories or their Assistant's authorise this compulsory vaccination programme?**

I represent Rodney William Baker of Waitara, New Zealand.

In my research to uncover how Rodney's property was seized without an oral court order I came across a website pertaining to (and questioning) your current swine flue vaccination programme involving 187 countries. (or 194) AA

Through further research I have found and received by email, information that indicates a plan of some kind to de-populate the western hemisphere and its allied countries with contaminated vaccines (Perhaps through having the greater potential to investigate and build a passive resistance to this) enabling the de-population of the 3rd world countries through famines and civil wars etc, while mainstream media appears to be denying or deflecting this information.

I have seen USA video clips of mass gravesites that each could take tens of thousands of bodies to fill, a huge desert stockpile of plastic coffins and nano tracking chips as examples of available information. e.g. www.theflucase.com

One of my concerns is for those who have grave concerns about this and have passively refused to be vaccinated, while what I believe to be a questionable law in its origin, may dupe good police officers into enforcing this upon them.

During my research into Rodney's property seizure I found a trail of untraceable signatures dating back 9 years and have found the same to be so while searching through files in many ring binders for others. I have many examples.

Heightening my concerns, is our Health Minister's failure to simply sign in a text box and return by fax, my letter dated 6 October 2009 (within the international law timeframe of 3 days) and allay my fears that New Zealand's signatory may not be traced by the signature, among the 187 now relied upon by W.H.O, to enforce compulsory vaccinations.

I am now left to wonder if each of the 187 signatures authorising compulsory swine flue vaccinations would not bear the true handwriting personalities of the signatories as purported and if critically examined, I wonder if each and every signature would not be found to legibly read a name that is slightly different in spelling to the signatory's name?

Collins Dictionary (First published in 1979) on page 1354 under the headword: **sign –** at **11.** it says: **to write (ones name) as a signature to (a document etc) in attestation, confirmation, ratification etc.**

With respect, if you believe these 187 signatures were produced by signatories that were authorised by the people of each relevant country and therefore genuine, could you please confirm this by handwriting your full name and usual signature in the box below and return this to me by fax (or email) and post?

I, ________________________________ as Director-General of W.H.O. confirm that I believe these 187 signatures, serving as authorisation of this compulsory vaccine programme, are genuine.

Signed: ____________________

I would take no reply from you to mean that "you agree" these 187 signatures, that W.H.O. now relies upon to enforce this vaccine programme are "not genuine" (giving cause to question this swine flue vaccine) and for this reason, every man, woman and child in those 187 countries can legally refuse the vaccine, and that you have advised the true representatives for those countries that this programme is unwarrantable in its origin (ill found). Please note, I do not require an opinion letter.

Yours sincerely, rod (Rodney's legal representative) P.P. [signature]

Regió7

"Comencem a vacunar quan el 60% de la població ja ha passat la grip!"

Regio7, 17 Novembre 2009, 00:00
https://www.regio7.cat/manresa/2009/11/17/comencem-vacunar-quan-60-poblacio-50672432.html

És favorable a la vacunació?

No sóc antivacunes, però en el tema de la vacuna de la grip, que és un germen amb molta capacitat de mutació, hi ha certes situacions que s'han de considerar. Personalment, no me l'he posada mai. El que sí que tinc clar és que hi ha malalts amb patologies greus que es poden descompensar que se la poden posar amb tranquil·litat. En principi, no tenim constància que provoqui malalties greus. Quant a la grip A, les dues principals situacions són: primer, que la vacuna ens arriba tard. Fa cinc setmanes que estem veient grips; som a la zona mitjana-final del contagi. La vacuna es comença a posar el dia 16 i tarda més de tres setmanes a començar a fer defenses. En segon lloc, tots teníem clar que l'epidèmia de la grip A pràcticament segur que es comportaria com el que va passar l'estiu al continent austral: una grip benigna, més contagiosa que la normal. Que la grip H1N1, coneguda com la grip A, substituiria la convencional. Aquest any no n'hi ha hagut de convencional, i aquí pràcticament tampoc no n'hi ha. No sóc antivacuna però, si algú no se la vol posar, que no se la posi.

A més, si hem anat tan tard...

És que comencem a vacunar quan el 60% de la població ja ha passat la grip!

S'ha portat bé la part que té a veure amb la informació?

Hi ha hagut un excés d'informació. Han traslladat a l'opinió pública una sensació de gravetat i de descontrol per la qual no hi havia cap motiu.

Hi ha veus, com la de la monja Teresa Forcades, que han estat molt crítiques. Fins i tot s'ha arribat a dir que tot plegat era un muntatge de les farmacèutiques...

Políticament, i no parlo només d'Espanya sinó també de tot Europa, es va decidir que aquí s'havia de fer la vacunació. A partir d'aquest moment, has de pressionar les farmacèutiques perquè facin una vacuna de manera ràpida. Són dues cases farmacèutiques les que decideixen fer-ho, i aquestes cases han de vendre la vacuna. És un tema purament comercial. Si els governs pressionen les farmacèutiques perquè facin una vacuna de pressa, amb els diners que això representa, i ells la fan, l'han de vendre, si no, s'arruïnen. Que hi ha hagut màrqueting publicitari per part de les cases comercials, segur. Com aquest degoteig que s'ha mort un pacient i se n'ha mort un altre quan, per la grip convencional, mor més gent i no se'n parla.

Què li diuen els pacients? Perquè, una de les coses que s'han donat més avui [ahir per al lector] és que la gent demana molta informació al seu metge.

Perquè hi ha por i, quan hi ha por, es demana informació, perquè la gent no té clar què passa. Jo els explico això. Sabem el que ha passat al continent austral i el que està passant aquí. Que és una grip més benigna que la convencional, que és una grip més contangiosa, que molta gent la passa i no se n'adona i en altres és una mica més agressiva i t'has de quedar a casa... S'ha provocat una certa sensació de gravetat que no és real.

REUTERS

Doctors say most Britons reject swine flu vaccine

Reuters, 18 November 2009, 7:10 AM
https://www.reuters.com/article/flu-vaccines-britain-idINLH64945620091118

* Poll shows only 46 pct of those offered vaccine say yes
* Doctors say pregnant women particularly reticent

London, Nov 18 (Reuters) – More than half of Britons being offered vaccination against pandemic H1N1 flu are turning it down because they fear side-effects or think the virus is too mild to bother, a survey of doctors showed on Wednesday.

Many of the 107 family doctors polled by Britain's Pulse magazine said there was widespread resistance from patients and on average only 46 percent of those offered the vaccination agree to have it.

Doctors reported particular difficulties in persuading pregnant women to be vaccinated against the virus, according to Pulse, a trade newspaper for doctors.

"In all the pregnant women we've offered it to, I think only about one in 20 has agreed," Dr Chris Udenze, a family doctor based in Nottingham, central England, said in the survey.

Scepticism has been growing in Britain and other European countries about health authorities' handling of the H1N1 pandemic because the number of people infected has been lower than originally feared [ID:nLB209221].

Britain began a vaccination programme on Oct. 21 sending out doses of GlaxoSmithKline's GSK.L Pandemrix and Baxter's BAX.N Celvapan for high-risk hospital patients, front-line healthcare workers, children in seasonal flu risk groups, pregnant women and people with compromised immune systems.

British health authorities have twice revised down their worst-case scenarios for H1N1 flu, which was declared a pandemic in June and has killed more than 7,000 people worldwide, according to latest data from the European Centre for Disease Prevention and Control.

Original estimates that as many as 65,000 could die from H1N1 in Britain have now been cut to a prediction of around 1,000 deaths – way below the average annual toll of 4,000 to 8,000 deaths from seasonal winter flu.

Richard Hoey, Pulse's editor, said his survey showed that many patients, and "a substantial number of doctors" were "unconvinced there is sufficient evidence that swine flu vaccination is safe and necessary".

franceinfo:

Grippe A: les médecins vaccineront en cabinet au printemps?

France Info, 19 Novembre 2009
https://web.archive.org/web/20091122085255/http://www.france-info.com/sciences-sante-2009-11-19-grippe-a-les-medecins-vaccineront-en-cabinet-au-printemps-370771-29-30.html

Plus de 200.000 personnes ont été vaccinées contre la grippe A en France, où la campagne de vaccination s’accélère, a déclaré ce jeudi la ministre de la Santé, Roselyne Bachelot. La ministre a également évoqué la possibilité de poursuivre la vaccination, "au printemps", dans les cabinets médicaux.

Mme Bachelot a justifié sur LCI la vaccination dans des centres en soulignant que "c’est un problème de logistique et de sécurité de l’approvisionnement". "Nous sommes sur une campagne de vaccination dans des centres collectifs parce que ce n’est pas possible autrement, ne serait-ce que la livraison des vaccins à 50.000 cabinets généralistes avec le respect de la chaîne du froid", a dit la ministre.

Après cette phase de vaccination dans les centres, Roselyne Bachelot étudie avec les médecins "la possibilité, dans une deuxième phase, au printemps, qu’ils puissent continuer la vaccination dans leur cabinet". Actuellement c’est tout à fait impossible, a-t-elle affirmé, estimant en outre qu’"on a besoin des médecins pour soigner les gens".

Devant le peu d’enthousiasme rencontré pour l’instant par le dispositif mis en place par les autorités il y a une semaine, Roselyne Bachelot a estimé qu’il ne fallait pas "juger sur quatre jours une campagne de vaccination qui va durer quatre mois". "Le nombre de personnes qui se vont fait vacciner augmente tous les jours. Nous sommes à plus de 24.000 personnes par jour", a-t-elle précisé sur LCI. "Nous avions 200.0000 personnes hier matin qui étaient vaccinées".

La vaccination sera proposée aux enfants scolarisés à partir du 25 novembre. Ce jeudi matin, 116 établissements scolaires étaient fermés en France, selon le ministère de l’Education nationale. Au total, 18 académies sur 30 sont concernées, aucune en région parisienne pour l’instant.

THE FLU CASE

200,000 people in France have taken the swine flu jab as government ups tempo

The Flu Case, 19 November 2009, 15:25
https://web.archive.org/web/20100102043642/http://theflucase.com/index.php?option=com_content&view=article&id=1975%3A200000-people-in-france-have-taken-the-swine-flu-jab-as-government-ups-tempo&catid=1%3Alatest-news&Itemid=64&lang=en

200,000 people have been given the swine flu jab in France as the government accelerates its vaccination programme in special vaccine centers.
French Health Minister Roselyne Bachelot defended her decision not to use GPs to give the swine flu jabs in special governmetn-administered syringes, saying that centers were more efficent.
200,000 people represents less than half a per cent of the France's total population.

H1N1 – UNIS FACE AU VACCIN !

285 le juge deboute les medecins pour le premier refere

UnisFaceauVaccin, 18/19 Novembre 2009.
http://www.unisfaceauvaccin.org/index.php/actualites/activisme/285-le-juge-deboute-les-medecins-pour-le-premier-refere.html (deleted)

Le premier référé déposé par des médecins du Calvados contre les réquisitions dans le cadre de la vaccination H1N1 a été rejeté aujourd'hui même par le tribunal administratif de Caen. «Le juge a considéré que ces référés ne portaient manifestement pas atteinte aux libertés fondamentales, et qu'elles ne constituaient pas du travail forcé puisque l'administration a pris soin de réquisitionner d'abord des volontaires», indique le Dr Antoine Leveneur, président de l'URML de Basse-Normandie.

La semaine dernière, des médecins libéraux du Calvados avaient déposé trois référés contre les réquisitions préfectorales du département dans le cadre de la campagne de vaccination contre le virus H1N1.

Mais rien n'est définitivement joué car si le premier référé, baptisé «liberté», avait été déposé pour atteinte aux libertés fondamentales, les deux autres, baptisés référé «suspension» et référé «annulation», s'attaquent à leur éventuelle illégalité.

Antoine Leveneur reste optimiste car les perspectives de gagner ces deux référés lui paraissent raisonnables: «Tout se passe comme si le juge considérait qu'il y a un doute sur la validité des réquisitions, résume-t-il, et qu'il se réservait pour lundi prochain», date à laquelle la justice se prononcera sur ces deux autres référés.

THE FLU CASE

French court rules that health care workers can be requisitioned for swine flu jab campaign

The Flu Case, 19 November 2009, 13:33
https://web.archive.org/web/20100102053837/http://theflucase.com/index.php?option=com_content&view=article&id=1894%3Afrench-court-rules-that-health-care-workers-can-be-requistioned-for-swine-flu-jab-campaign&catid=1%3Alatest-news&Itemid=64&lang=en

An administrative court in Caen, France, has rejected a bid by doctors to have the government's requisition of health care personnel to participate in the swine flu jab campaign declared a violation of fundamental liberties and forced labour.

Two more legal cases calling for the suspension and annulation of the order are still to be heard.

MED НОВОСТИ

[*Юрий Захарович Гендон*]

Насколько безопасны прививки?

MED Новости, 19 ноября 2009, 09:07
https://medportal.ru/mednovosti/naskolko-bezopasny-privivki-fa8d5b5f-41b6-4882-8c52-d97577550c68/

9 ноября в России официально стартовала кампания вакцинации от пандемического гриппа H1N1. Помимо ежегодных прививок от гриппа, согласно общенациональному календарю прививок россияне получают до двух десятков видов вакцин, защищающих от туберкулеза и гепатита, полиомиелита и бешенства, краснухи, столбняка и даже рака.

Доказана ли безопасность всего набора применяемых вакцин?
Какие осложнения возможны при вакцинации?
Какой вред и какую пользу может принести отказ от прививок?
На вопросы читателей Медновостей ответил доктор медицинских наук, гриппполог, главный научный сотрудник НИИ вакцин и сывороток им. И. И. Мечникова РАМН, консультант ВОЗ, профессор Юрий Захарович Гендон.

Прием вопросов завершен, ответы опубликованы.

Александр: Здравствуйте. Как вы относитесь к мысли о том, что шумиха и пропаганда вокруг очередного, менее опасного, чем обычный сезонный, гриппа H1N1 имеет целью не обезопасить людей от него, а наоборот, посеять в людях страх, панику и под видом прививки заразить человека каким-то более опасным вирусом?

Это абсолютно неверно. Понимаете, для всего должно быть какое-то обоснование. А какую цель преследуют, когда заражают человека какими-то вирусами? Смысл какой? Для чего? По всему миру все люди, и правительства, и органы здравоохранения ставят задачей всех чем-то перезаразить?..
Я думаю, что это вопрос совершенно неправомерный, не стоит даже на него отвечать.

Вадим: Юрий Захарович, почему в России не публикуется статистическая отчетность по вакцинации, предоставляемая в ВОЗ?

Мы каждый год предоставляем информацию о количестве вакцинированных. Эти сведения идут во Всемирную организацию здравоохранения, а она составляет список стран с расчетом количества доз вакцины.
Россия находится примерно на двадцатом месте по количеству вакцинированных на 100 тысяч населения. Мы точно знаем, сколько вакцины приготовлено в России для бесплатного применения. Большое количество вакцины покупают богатые фирмы за рубежом, да и обычные люди могут просто зайти в аптеку и купить ее. Это количество не проходит через Министерство здравоохранения, но то, что идет через министерство, мы знаем прекрасно.
В советское время мы ежегодно прививали 90 миллионов человек, потому что производили 90 миллионов доз вакцины. Сейчас в России производится от 20 до 25 миллионов доз вакцины от гриппа.

kremlin faggot: Уважаемый Юрий Захарович, у меня появилось мнение,что излишняя паника вокруг «свинного грипа» раздута. Это очень хороший инструмент для манипуляции на фоне мирового кризиса, мол экономика экономикой а что если будет ещё хуже, эппидемия например. Хотелось бы спросить сколько жизней в год уносит «обычный» грипп? и может ли быть что N1H1 это грипп 21 ого века,и нам просто нужно с этим смириться? Благодарю.

Есть совершенно четкие сведения, которые были представлены ВОЗ на основании более 50 лет анализа данных, предоставленных более чем 100 лабораториями из 80 стран. Ежегодно от гриппа и его осложнений по данным ВОЗ погибает 250 – 500 тысяч человек при сезонных эпидемиях. Это если считать правильно смертность, так как основная смертность от гриппа – так называемемая «задержанная смертность» – не в течение 5 – 7 дней, когда человек болен, а, в основном, позже, за счет осложнений – пневмонии, обострений хронических болезней.

Надежда: Здравствуйте! Уважаемый Юрий Захарович,хотелось бы спросить:

- Почему незначительное кол-во людей (около 1,5 тыс, по сведениям из средств массовой информации) заразившихся вирусом свиного гриппа называют эпидемией?

Второе – как из общей массы заболевших гриппом,в этом году, выявляли тех, кто заболел именно свиным гриппом? Симптоматика ведь одинаковая!!!! Что у всех брали анализ и выделяли вирус? Откуда такие конкретные цифры?

Третье – не считаете ли Вы, что поднятая шумиха на руку фармацевтическим компаниям и ими же инициируется.

Это правильный вопрос. ВОЗ еще в апреле, учитывая что этот вирус предается от человека к человеку и попал более чем в сто стран, объявила пандемию. Тут можно спорить, но это было объявлено ВОЗ. Вряде стран действительно заболеваемость этим вирусом очень высока, например, в США, где практически во всех штатах имеется эпидемия и основной возбудитель – грипп H1N1 штамма Калифорния.

Что у нас делается, сказать достаточно трудно. Помимо вируса гриппа, острые респираторные заболевания могут вызывать еще более ста различных вирусов. По клиническим проявлениям грипп практически невозможно отличить, а тем более различить, вирус это человеческий или свиной, а то и вообще не вирус гриппа: парагрипп или риновирус.

В большинстве стран Европы, Америки, в Японии у значительного количества людей, которые обращаются к врачам, берут смыв, из которого выделяют вирус и смотрят, что это за вирус. Например, во Франции почти каждый год во время эпидемии гриппа наблюдалась эпидемия очень неприятного для детей респираторно-синцитиального вируса. Нужно обязательно знать, какой процент от общей заболеваемости ОРВИ приходится на грипп и другие возбудители.

Когда наступает эпидемия, основная масса ОРВИ вызывается вирусом гриппа. Тем не менее, некоторые считают, что при очень серьезной эпидемии (не пандемии), только 20 процентов заболевших приходится на вирус гриппа, а остальные - это другие 100 возбудителей. То, что у нас сейчас называется «превышение порога заболеваемости острыми респираторными заболеваниями». Поэтому говорят, что начинается эпидемия острых респираторных заболеваний. Гриппа при этом может быть очень мало или он может даже отсутствовать.

Говоря об эпидемиях на Дальнем Востоке и т. д., нужно очень хорошо себе представлять, какой основной вирус является источником этой эпидемии. По сути дела мы можем говорить сейчас об эпидемии острых респираторных вирусных заболеваний. Если всего у нас заболело вирусом гриппа свиней столько, сколько передают в СМИ, то это ерунда по сравнению с сезонными эпидемиями.

Во время настоящих гриппозных эпидемий заболевает 20-30 процентов детей, 5-10 процентов взрослых. Каждый десятый заболевает гриппом во время настоящей эпидемии, то есть в одной Москве заболеет гриппом миллион человек, а у нас тут пять тысяч случаев, так что правильнее называть ситуацию "вспышкой гриппа H1N1 Калифорния".

Дмитрий: Здравствуйте, Юрий Захарович!

1. Проходят ли прививки сертификацию подобно лекарствам (побочные действия, включая канцерогенность; противопоказания и пр.). Нужна ли, на Ваш взгляд, такая сертификация?

2. Имеются ли какие-нибудь данные насчет «емкости» иммунитета – зависимости его эффективности от вида и количества перенесенных заболеваний и прививок? Заранее благодарю.

Конечно, каждая новая вакцина проходит тщательную проверку. Прежде всего, она проходит так называемую доклиническую проверку. Это проверка на безопасность: канцерогенность, аллергизация и целый комплекс совершенно обязательных проверок, которые эта вакцина проходит. Если хотя бы по одному пункту она не проходит, эта вакцина дальше не идет вообще.

Если она прошла очень сложное исследование – в 3-4 или, для некоторых препаратов, которые теоретически могут быть канцерогенными, то 6-9 месяцев, то дальше идет клиническое исследование. Это 20 очень крепких молодых людей, добровольцев, которым за это платят большие деньги, они получают вакцину. Прежде всего, смотрят на безопасность. Смотрят сотни разных показателей крови, мочи, нередко, если препарат сложный, их кладут в больницу, чтобы наблюдать за ними днем и ночью. Это первая стадия клинических испытаний.

Если она проходит нормально, у людей нет никаких необычных неблагоприятных реакций, тогда идет вторая часть клинических испытаний. Это уже 100 человек. На это тоже берутся достаточно здоровые добровольцы. Они вакцинируются, тут смотрят насколько вакцина эффективна, как она дает выработку антител.

Есть определенный уровень антител, который является защитным, это 1/40, не менее 70 процентов испытуемых должны иметь титр 1/40 или выше. Если ниже, значит, вакцина слабоиммуногенная и ее тоже не разрешают к применению на людях.

Дальше идет полевое испытание. Тут уже не здоровых добровольцев выбирают, а идет случайная выборка 2000 человек разного возраста, телосложения, здоровья. Эти люди олицетворяют ту массу, которая будет вакцинироваться. Одновременно берется не менее 2000 человек, которым вакцина не вводится. Раньше вводили плацебо, пустышку. Теперь это считается не очень правильным, их просто не вакцинируют.

Дальше уже все закодировано, люди имеют номера и те, кто проверяют, не знают, кто контрольная группа, а кто группа, получающая вакцину. Это очень важное исследование, но, к сожалению, его не всегда удается делать. Если бы с этим свиным гриппом мы бы начали еще и полевые испытания, то вакцина была бы готова тогда, когда все кончится. Такие срочные дела, как пандемия или необычная вспышка, кончаются проверкой на 100 добровольцах. Хотя, с моей точки зрения, это не очень хорошо, потому что разные возрастные группы поразному реагируют на вакцину.

Например, если вы прививаете взрослых людей от 20-55 лет, то у них возникает защита на 80 процентов. Если вы прививаете детей той же вакциной от 6 месяцев до 9 лет или пожилых лиц, то у них защита уже 50 процентов. Это касается большинства инактивированных вакцин. Сейчас уже есть вакцины с адьювантами, которые дают значительно более высокий процент защиты.

У пожилых тоже защита может составлять 50 процентов. Но надо помнить, что 50 процентов – это защита от заболевания, но 80 процентов составляет защита от осложнений. То есть, если человек был вакцинирован и все-таки заболел, то у него болезнь протекает легче, редко бывают осложнения. Это очень важно помнить.

Что касается иммунитета, то есть четкие показатели: не менее 70 процентов привитых людей должны в результате иметь титр антител 1/40 или выше. Если вакцина не работает до такого предела, то нечего ее применять, толку от нее будет мало.

Наталья: Боюсь, что вакцинация снижает иммунитет, Не лучше ли переболеть «естественно» гриппом, тем более, считается, что при высогой температуре «сгорают» всякие плохие клетки, чем быть безоружным перед страшными болезнями – раком, напрпимер.

Конечно, противогриппозный иммунитет после того, как человек переболеет гриппом, будет к данной разновидности вируса значительно выше, чем после прививки. Но надо помнить, что можно просто умереть от гриппа и его осложнений. Это очень серьезная инфекция. Грипп повреждает функции всех систем организма, всех!

Вспомните: после гриппа у вас еще недели две-три большая слабость. Так происходит потому, что организм вынужден тратить огромные ресурсы на восстановление нормальной работы всех систем организма. Многие физиологи считают, что каждое заболевание гриппом стоит нам года жизни, такую мы тратим такую энергию, чтобы выздороветь.

А ведь можно и не выздороветь. Общийиммунитет при гриппе резко падает и пневмококки, с которыми мы легко боремся в нормальном состоянии, начинают вызывать пневмонию, которая и дает значительное количество смертных случаев. Или человек с хроническими заболеваниями может жить долго с помощью лекарств, диеты и т. д. А вирус гриппа начинает «бить» и эту систему и уже не хватает ни лекарств, ничего. От обострения хронического заболевания человек умирает.

То количество антигена, которое попадает в организм с инактивированной вакциной, настолько мизерное, это 45 микрограмм, что никак не может повлиять на функцию иммунной системы. Это очень высокоочищенная вакцина, там нет ничего, что бы вызывало раздражение иммунитета, кроме этих вирусных белков, а их – микроскопические количества. Так что вакцинация против гриппа инактивированной трехвалентной вакциной ни в какой степени не снижает иммунитет.

Олег: Добрый день Юрий Захарович,В США появилось множество материала о вреде вакцины от свиного гриппа. Что якобы эта вакцина была уже произведена в 1976 году и постепенно убивает иммунитет человека. Делается все это якобы, для резкого уменьшения численности людей на планете, так как ресурсы не безграничны. Что вы можете сказаь о безопасности данной вакцины и какая страна является производителем данной вакцины? Спасибо заранее.

Не вредно ли получать вакцины для здоровья и в частности от свиного гриппа? Вакцинация будет проводиться препаратами чьего производства? Правда ли, что в США вакцина против свиного гриппа был изобретен в 1976?

У нас вакцина совершенно другая. Тогда делали вакцину целиком к вирусу свиного гриппа, как он был, а мы сейчас научились делать так называемые реассортанты (то, что раньше называлось рекомбинацией).

Геном вируса гриппа состоит из 8 участков, которые самостоятельно функционируют. Поэтому, если у вас в одну клетку попадают один и другой вирус, то получается реассортация, в одну вирусную частицу может попасть, например, 4 гена от одного вируса, а 4 - от другого. Свиной вирус - это тройной реасортант, у него 5 генов свиных, 2 гена куриных и 1 ген человеческий.

Когда штаммы для изготовления вакцины выделяют от людей, они очень плохо размножаются. А чем хуже вирус размножается, тем сложнее сделать вакцину. Есть один штамм человеческий, PR8, который очень хорошо размножается. Это происходит за счет тех генов, которые не входят в наружную оболочку. От него берут всю внутренность, 6 генов, которые отвечают за высокую продуктивность. Гены геммагглютинина и нейраминидазы, которые как раз отвечают за защитный иммунитет, берут от того вируса, от которого нужна вакцина. Это все делается в двух лабораториях ВОЗ, исключительно квалифицированные люди там сидят. Они получают такой реассортант, очень хорошо его изучают, потом бесплатно его распределяют в те компании, которые производят вакцины.

и т.д. =>

NBC NEWS

1.5 million a day getting H1N1 vaccine in China

NBC News / The Associated Press, 19 November 2009, 10:06 AM +08
https://www.nbcnews.com/id/wbna34026516

China's health minister said Wednesday his country is vaccinating 1.5 million people a day against swine flu, part of a mammoth effort to reach nearly 7 percent of inhabitants of the world's most populous country by year's end.

China's health minister said Wednesday his country is vaccinating 1.5 million people a day against swine flu, part of a mammoth effort to reach nearly 7 percent of inhabitants of the world's most populous country by year's end.

Chen Zhu told The Associated Press that more than 50 million Chinese have been immunized so far.

He also defended China's aggressive quarantine of foreigners with flulike symptoms as well as health detentions of its own citizens.

"With initial efforts of containment, actually we not only reduced the impact of the first wave to China, but we also won time for us to prepare the vaccine" now being given to China's people, Chen said in an interview during the Havana meeting of the Global Forum for Health Research.

After the swine flu first appeared in Mexico last spring, China put Mexican visitors – and people from other countries who had set foot in Mexico – in weeklong quarantines and monitored them for the virus, whether or not they seemed sick.

Chinese authorities also isolated entire planeloads of international visitors if someone on board experienced flulike symptoms. They pulled passengers off trains and blocked access to villages if someone got sick after coming into contact with a foreigner.

Such measures are easier to impose in an authoritarian state. They sparked protests around the world, but when asked if they were successful, Chen said: "Exactly, very successful, exactly."

"We are confident the situation is under control," he said.

Chen said officials have moved past containing swine flu and are focusing now on improving emergency room treatment to keep those with the most urgent cases of the virus from dying.

Goal of vaccinating 80 to 90 million

He said China developed its swine flu vaccine in late August and plans to give it to 1.5 million Chinese a day in November and December, in hopes that 80 million to 90 million will have been vaccinated by the end of 2009. That would be nearly 7 percent of the population – and officials hope to vaccinate an additional 3 percent in January and February.

"We know this is not enough for a population of 1.3 billion, but at least for the vulnerable people, for the students, people with underlying basic diseases and, in the future, for pregnant women, we have vaccines," Chen said.

He added that vaccinating medical personnel is also a top priority, to protect their patients.

Tom Skinner, spokesman for the U.S. Centers for Disease Control and Prevention in Atlanta, said that by comparison, the United States has allocated 49 million swine flu vaccine doses since late September.

He said American manufacturers are capable of producing well over 1 million vaccines a day – and China's factories and health officials could do better than that amid a major vaccination campaign.

"One and a half million, that's a lot of people," he said. "It goes to show you what can be done when you have resources and people mobilized as well as people coming forward to get vaccinated."

Skinner declined to comment on whether Chinese quarantine programs have been as successful as Chen and other top Chinese officials claim. As for the U.S., he said, "The CDC did not implement such measures because the virus was so widespread so early that such measures would likely not have an impact."

Chen said China has no plans to export its vaccine – at least for now.

"We are in a shortage of the vaccine in China. In the short term, no exports," he said. "We will see if next year there is a possibility to export a little bit, but to get the pandemic under control in China should be the most important contribution for its control worldwide."

Official refutes A(H1N1) vaccine suspension rumor

China Daily, 19 November 2009, 16:38

https://global.chinadaily.com.cn/china/2009-11/19/content_9005996.htm

Beijing: Beijing health authority said on Thursday that the A(H1N1) vaccine inoculation would not be suspended, dismissing a rumor circulating among the city's mobile phone subscribers.

"The inoculation would not be suspended," said Zhang Jianshu, director of the publicity department with Beijing Municipal Health Bureau. "Beijing has reported no serious case of adverse reaction."

Zhang said some Beijing residents had received text messages saying that the city's municipal government would halt the ongoing inoculation before the A(H1N1) vaccine was reassessed. The messages did not give reasons why such a move would be made.

"No such decision has ever been made by the government," Zhang said. "It's totally baseless."

He said Beijing Public Security Bureau was tracing the rumor.

Deng Ying, director of the Beijing Center for Diseases Control and Prevention, said over 1.5 million Beijing residents had been inoculated as of Wednesday.

The A(H1N1) influenza cases accounted for nearly 90 percent of all flu cases reported in the Chinese mainland last week, which reported 10,828 cases of A(H1N1) flu from November 9 to 15, with 28 deaths.

Nursing Times

Swine flu vaccine uptake

Nursing Times, 19 November 2009
https://www.nursingtimes.net/archive/swine-flu-vaccine-uptake-19-11-2009/

Several newspapers have reported that pregnant women and other vulnerable people are refusing to have the swine flu vaccine. *The Times* reported that a poll of GPs found that only 46% of people who were offered the vaccine have accepted it, and one doctor estimated that only 5% of pregnant women have had it.

The news reports are based on a "snapshot" survey of 107 GPs. The survey asked how likely they were to hit the government's target of vaccinating at least half of their patients who are under 65 and in high-risk groups this winter, and the estimated vaccine uptake in their practice.

It is not clear if the experiences of this relatively small sample of GPs can be viewed as representative of the 30,000 other GPs in the UK. This picture of overall uptake is based purely on these 107 GPs' estimates. It is also possible that these GPs chose to take part in the survey themselves, and GPs who chose not to take part may have a different experience of vaccine uptake.

Based on this survey, it can't be assumed that there is similar vaccine uptake nationwide, or that particular groups, such as pregnant women, are more likely to reject the vaccine.

What are the news reports based on?

These news reports are based on two articles in Pulse, a magazine for GPs. Both articles are on the swine flu vaccination programme, which has been in progress since late October. One article, on overall uptake, was based on a "snapshot" survey of GPs that was recently carried out by the magazine. The other, on uptake in pregnant women, may be from the same survey, but this was not made clear.

One of the articles reports that GPs are "braced" to miss a target that was set by the government to vaccinate at least half of all people in high-risk groups aged under 65 against swine flu during this winter's campaign. The other article reports that pregnant women are rejecting the vaccine because of fears over its safety.

Pulse surveyed 107 GPs, asking them whether they felt they would achieve this target in their practice and to estimate how many of the people who were offered the vaccine in their practice had accepted so far. They could also make any other relevant comments.

What did the survey find?

The survey found that only 37% of GPs believed that their practice could achieve the government's target, based on their experience so far. Just over half (53%) said they would not hit the target, and 10% said it was too early for them to say. The reasons given by GPs for not hitting the target are a low uptake of the vaccine by those who were offered it, and delays in receiving vaccine supplies. Just over half the practices had started the vaccination campaign, and these practices estimated that less than half the people offered the vaccine had accepted it.

In the article on vaccine uptake in pregnant women, one GP estimated that only 5% of pregnant women in their practice had agreed to be vaccinated, while another GP estimated that the figure in their practice was less than 25%. Other GPs stated that there was scepticism about the vaccine among their pregnant patients.

Do these findings represent all GPs?

This survey cannot answer that question. It was a relatively small survey which asked GPs' opinions on the likelihood of reaching vaccination targets and their estimates of vaccine uptake in their practices. It is not clear how these GPs were selected to take part in the survey, how many of those who were asked agreed to take part, or which areas of the country were covered. The figures on overall uptake were based on the GPs' estimates.

The only figures that estimated uptake in pregnant women came from two GPs, whose estimation differed about fivefold (one in 20, and less than one in four). It is difficult to gauge uptake based on this limited survey, and it is not possible to say whether these results are representative of the entire country.

Regarding reasons for low uptake, the GPs could only state the concerns that their patients had reported to them. It is not possible to say how representative these reports were of people's reasons for not having the vaccine. It is also not clear whether certain at-risk groups are more likely to reject the vaccine than others.

What are the problems with supply?

Pulse reported that each practice in England and Wales, regardless of size, was due to receive an initial delivery of 500 doses of the vaccine, and GPs should be able to order further deliveries from mid-November. However, the magazine says that larger practices reported not having enough doses of the vaccine to go round, which has lead some of them to delay their vaccination campaigns.

What reasons were given for rejecting the vaccine?

The GPs surveyed said that people who rejected the vaccine did so because of concerns about its safety and the risk of side effects, which were reported as headaches, sleeplessness and stomach cramps. Some GPs also reported that patients were concerned over an ingredient in the vaccine called thiomersal.

Pandemrix is one of the two swine flu vaccines being used in the UK. It contains a very small amount of thiomersal as a preservative. It is added to prevent bacterial or fungal contamination occurring during the preparation, storage and use of the vaccine.

In the 1990s, some people raised concerns about the use of thiomersal in vaccines, which lead the WHO Global Advisory Committee on Vaccine Safety to review the scientific evidence about its safety, which it did most recently in 2006. It concluded that "there is no evidence of toxicity in infants, children or adults exposed to thiomersal in vaccines."

Are the vaccines safe?

Both swine flu vaccines (Pandemrix and Celvapan) have been authorised for use by the European Medicines Agency (EMEA). Vaccines would not be licensed if they were considered unsafe. What is known about the safety of these vaccines is based on clinical trials of prototype bird flu vaccines and trials using the swine flu vaccine itself. Based on these studies, the swine flu vaccine has been judged to be acceptably safe for use.

People who are offered the vaccine and are concerned about its safety should discuss this with their doctor.

Does the vaccine have any side effects?

The Medicines and Healthcare products Regulatory Agency (MHRA) reports that "as with any vaccine, the swine flu vaccines will cause side effects in some people, although not everybody will have a side effect. The most common side effects will be injection site reactions (pain, swelling and/or redness), headaches, dizziness, muscle aches, mild fever and fatigue. These side effects are mainly mild and last only two to three days. Some of these symptoms may be similar to a mild flu-like illness, although it should be stressed that the vaccines cannot cause swine flu itself."

Because clinical trials are relatively small, they may not identify very rare side effects. To identify these, the side effects of the swine flu vaccine will be monitored as it is used. It is important to note that the same is done for all new medicines and vaccines, not just the swine flu vaccine.

Who should be vaccinated and why?

Although swine flu is mild in most people, some people who get swine flu have serious complications, which can be fatal. To reduce the risk of these complications, the vaccination programme prioritises people who are most at risk of having complications from swine flu. These priority groups are:

- People aged between six months and 65 years who belong to at-risk groups that would usually be offered the seasonal flu vaccine (see below).
- Frontline health and social care workers.
- Pregnant women.
- People who live with those whose immune systems are compromised, such as cancer patients or people with HIV/AIDS.
- People aged 65 and over who would usually be offered the seasonal flu vaccine.

Frontline health and social care workers are prioritised because they deal with at-risk groups, so are more likely to catch and spread swine flu to at-risk patients. Prioritising them also aims to ensure that the health service will continue to run smoothly during the pandemic.

People who would usually receive the seasonal flu vaccination include those who have:

- Chronic respiratory disease, such as chronic obstructive pulmonary disease (COPD).
- Chronic heart disease, such as heart failure.
- Chronic kidney disease.
- Chronic liver disease, such as chronic hepatitis.
- Chronic neurological disease, such as Parkinson's disease.
- Diabetes requiring insulin or oral diabetic medications.
- Immunosuppression (a suppressed immune system) due to disease or treatment.

Why is it important for pregnant women to be vaccinated?

Pregnant women are one of the groups that are more likely to have serious complications if they get swine flu, which could result in miscarriage and premature labour.

There is evidence that pregnant women are at increased risk of severe disease and of being admitted to hospital with flu-related problems. The risk increases as the pregnancy progresses, and women in the third trimester of pregnancy are particularly at risk. (WHO 2009, Jain et al., 2009, Jamieson et al., 2009).

The World Health Organization has stated that 7–10% of all hospitalised patients with swine flu are pregnant women in their second or third trimester. Pregnant women are 10 times more likely to need care in an intensive care unit than the general population. (WHO, 2009).

Complications in pregnant women, based on information on seasonal flu, may include pneumonia and cardiorespiratory complications. (Kort BA et al., 1986; Neuzil KM et al., 1998).

Both swine flu vaccines have been licensed for use in pregnant women, but it is recommended that they should be given Pandemrix. This is because it appears to give adequate levels of antibodies after a single dose, protecting the recipient more quickly than Celvapan, which requires two doses given three weeks apart.

Schoolchildren to start getting swine flu vaccinations next week

Irish Times, 19 November 2009
https://www.irishtimes.com/news/schoolchildren-to-start-getting-swine-flu-vaccinations-next-week-1.774262

Schoolchildren are expected to start receiving swine flu vaccinations next week, the Health Service Executive has said.

More than 800,000 students aged between five and 18 years will be invited to receive the vaccinations in special clinics to be set up in some schools across the country in the coming days.

Some students will be invited to neighbouring schools to receive the vaccine, while others will be asked to attend their local HSE vaccination clinic.

School staff will also be vaccinated as part of this phase of the national vaccination programme against swine flu, which the HSE hopes can be completed by early next year.

The HSE said it was in the process of identifying schools that would be suitable for use as vaccination clinics and that further details would emerge today.

The Department of Education wrote to all primary and secondary schools in the country yesterday advising them of the arrangements.

In the letter, the department said a HSE vaccination pack would be provided for distribution to each student and that a consent form would need to be signed by the parents of children aged under 16.

Minister for Education Batt O'Keeffe has urged schools to continue their co-operation with the HSE.

"I want to thank principals, teachers, school staff and managers for the conscientious and thorough way in which they have co-operated with the public health authorities in averting the spread of the virus," he said.

THE FLU CASE

"No clinical experience" with Celvapan swine flu jab, admits Baxter

The Flu Case, 19 November 2009, 10:43
https://web.archive.org/web/20100102042302/http://theflucase.com/index.php?option=com_content&view=article&id=1873%3Aqno-clinical-experienceq-with-celvapan-swine-flu-jab-admits-baxter&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Baxter's swine flu jab Celvapan has not been tested according to the "Summary of product characteristics" on the website of the European Medcines Agency, the European Union drug regulator.

Annex I: Summary of product characteristics: Celvapan.

https://web.archive.org/web/20091123093801/http://www.emea.europa.eu/humandocs/PDFs/EPAR/celvapan/spc/emea-spc-h982pu06en.pdf

"There is currently no clinical experience with Celvapan (H1N1) in adults, elderly, children or adolescents.

The decision to use Celvapan (H1N1) in each age group defined below should take into account the extent of the clinical data available with a version of the vaccine containing H5N1 antigen and the disease characteristics of the current influenza pandemic," says the document under the Section Clinical Particulars 4.2 page 2

"No data are available in children or adolescents. However, should vaccination be considered necessary, the experience with similarly constructed vaccines suggests that dosing in accordance with the adult dose may be appropriate.

"There are currently no data available on the use of Celvapan in pregnancy.

"Data from pregnant women vaccinated with different inactivated non-adjuvanted seasonal vaccines do not suggest malformations or fetal or neonatal toxicity."

The document says under the section "Pharmacological Properties" that the vaccine has been authorised under special regulations applying to "Exceptional Circumstances." Under these emergency regulations, pandemic vaccines do not need to be tested for safety or efficacy before they are given to people.

Similar pandemic vaccines, Pandemrix and Focetria are classified as bioweapons by EU and US regulators.

Baxter's Celvapan is being used in Austria, Ireland and Germany, among other countries.

Two doctors who took the jab in Austria, including one who allegedly did it publicly to prove the jab was harmless, are said to have come down with high fever soon afterwards.

Both had to sign consent forms waiving their right to claim compensation from Baxter in the event of the jab causing damage.

More extracts from the document show

4.8 Undesirable effects
- Clinical trials with H5N1 mock-up vaccine

In clinical trials with the mock-up vaccine using an H5N1 vaccine strain (see section 5.1) in 606 subjects (326 between 18 and 59 years old, and 280 aged 60 and above), the following adverse reactions were assessed as at least possibly related by the investigator. Most of the reactions were mild in nature, of short duration and qualitatively similar to those induced by influenza vaccines. There were fewer reactions after the second dose of the vaccine compared with the first dose. The most frequently occurring adverse reaction was injection site pain, which was usually mild.

Adverse reactions from clinical trials with the mock-up vaccine are listed below (see section 5.1 for more information on mock-up vaccines).

Adverse reactions are listed according to the following frequency.

Very common (≥1/10)
Common (≥1/100 to <1/10)
Uncommon (≥1/1,000 to <1/100)
Rare (≥1/10,000 to <1/1,000)
Very rare (<1/10,000)
Not known (cannot be estimated from the available data)

Within each frequency grouping, adverse reactions are presented in the order of decreasing seriousness.

The Telegraph

Rebecca Smith

Millions of healthy children to be given swine flu jab

Telegraph, 19 November 2009, 5:16PM GMT
https://web.archive.org/web/20091122171657/http://www.telegraph.co.uk/health/swine-flu/6607867/Millions-of-healthy-children-to-be-given-swine-flu-jab.html

Three million children under five are to vaccinated against swine flu after a dramatic rise in serious cases in youngsters.

Children under five are three times more likely to be admitted to hospital than any other age group and in some areas of the country paediatric intensive care beds are filling up, Sir Liam Donaldson, Chief Medical Officer said.

As a result, parents of children aged between six months and five years will soon be sent letters inviting them to take their children to their local GP's surgery for vaccination.

The vaccine is voluntary however, and parents can choose not to send their child for the injection. It is known that some parents have concern about its safety, despite the World Health Organisation insisting that it is safe.

Currently only people with long-term illnesses, pregnant women and front line health workers are being vaccinated.

It was expected that children would be the next in line for vaccinations, but experts were assessing which age group would benefit most from the jab.

Sir Liam said it was expected that the vaccination programme for young children will begin 'in earnest' in December but it will depend on supplies of the jabs.

Reports from GPs have suggested around half of patients are refusing the jab but Sir Liam rubbished this as a 'small survey' and said their own polling conducted by Mori found three quarters of parents were willing to have their child vaccinated if offered the jab.

Children will be offered two injections, each containing one half of an adult dose of Pandemrix, made by GlaxoSmithKline, as data has shown this has produced a good immune response, but this will be kept under review.

Meanwhile the World Health Organisation said all the pandemic vaccines were showing a good safety profile and there were no differences between them.

Young children are being hit particularly hard by the H1N1 virus and in England one in five patients in hospital is under the age of five, official figures show.

In addition to children, up to five million carers will also be offered the vaccine as the elderly and vulnerable people they look after would be at risk if their carer fell ill, Sir Liam said.

Talks are now under way with GP representatives on payments to deliver the next stage of the vaccination programme.

Independent experts said offering the vaccine more widely to healthy children was the 'next logical step'.

Sir Liam said the Government were not overreacting to the pandemic. He said: "Patients are dying and parents are standing by their children in intensive care beds in life and death situations. When we have got the weapons to deal with it I think we should use them.

"We are out to save lives and we are out to fight this pandemic all the way."

The total number of new cases of swine flu in England has dropped for the second consecutive week to 53,000.

However, Sir Liam said the number of patients in hospital and in critical care remained high.

The number of deaths confirmed as linked to swine flu is now 214 in the UK as a whole.

Director of Immunisation, Professor David Salisbury, said: "This is the first pandemic for which we've had a vaccine to protect people.

"Our phased approach to vaccine delivery is intended to focus on those most at risk and to use vaccine stocks responsibly."

Professor Steve Field, Chairman of the Royal College of General Practitioners, said: "We shouldn't underestimate swine flu – it is a nasty infection and its effects can be devastating.

"I know that some parents have concerns about immunisation but the swine flu vaccine is our most effective protection against the virus.

"This is obviously a personal choice but I would advise all parents whose children are offered the vaccine to take it up. If you are worried, please talk to your GP and get all the information so that you can make an informed choice."

Dr David Elliman, Consultant in Community Child Health at Great Ormond Street Hospital, said: "There is a lot of logic to this. The hospital admission rate in this group is particularly high and of course they have no previous exposure, unlike the elderly who have a certain degree of protection without vaccination. It seems a sensible next step."

Professor Robert Dingwall, member of the Committee on Ethical Aspects of Pandemic Influenza, said: "This is a logical extension of the vaccination programme, and a good example of the considered approach being taken by the UK government.

"You cannot give 60 million people a vaccination all at once so an approach that progressively brings in different groups, reflecting their relative risk and benefit, helps to manage the workload for GPs, while ensuring that the population is increasingly protected.

"It is also a responsible use of public funds in that decisions can be made at each point about whether there is sufficient clinical evidence to justify vaccinating additional groups.

"This means that vaccines are not wasted and that GPs do not spend more time than necessary on this work at the expense of their commitments to other patients and their illnesses."

INDEPENDENT

Under-fives to be given swine flu jab

Independent, 19 November 2009, 15:10 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/underfives-to-be-given-swine-flu-jab-1823582.html

Healthy children aged under five are to be given the swine flu jab, it was confirmed today.
Currently people in priority groups - including young children with asthma or diabetes - are being vaccinated. But the programme will now be rolled out to children with no underlying health issues, aged over six months and under five .

New figures show there were an estimated 53,000 new cases of swine flu in England in the last week, down from 64,000 in the week before. The number of people needing hospital care for the virus is 783, down from 785, in the previous week. Of those in hospital, 180 were in intensive care, up from 173 in the previous week. The number of people dying with swine flu has also risen from 124 deaths in England to 142.

The chief medical officer Sir Liam Donaldson said the drop could be due to a lag effect caused by the school half term.
The number of cases of swine flu tend to be higher when children are in school as they are known to spread the virus easily.

Last week, the death toll in the UK stood at 182, with 124 deaths in England, 33 in Scotland, 11 in Northern Ireland and 14 in Wales.
People aged six months to 65 in priority groups, including those with compromised immune systems, heart disease, asthma, diabetes and pregnant women, are currently being vaccinated.

The Government will announce if healthy children will be vaccinated alongside these groups or once the initial programme has finished.

The UK-wide policy was officially confirmed by the Scottish Government today ahead of a similar announcement in England, expected later.

Scottish Health Secretary Nicola Sturgeon said: "I am able to announce today that the next group in the population that will be vaccinated, or offered vaccination, is children aged over six months and under five years."

NHS figures show that children under 16 are the age group most likely to be admitted to hospital with swine flu, and 21 per cent of deaths in England are among under-14s.

Ms Sturgeon said around 260,000 children fall into the new category in Scotland.
They will be offered the jab from mid December, with the whole group ready for vaccination in the New Year. She said: "Negotiations have started to deliver the vaccine through GP surgeries.
"Young children will be offered the vaccine as soon as GPs complete the vaccination of the priority groups. "We anticipate this will happen during December, although completion of this phase of the campaign is not expected until mid January. "Parents of children who are in the age group should wait to be contacted to go to their local GP surgery."

The decision was made after independent scientific advice.

The vast majority of children who fall ill suffer only mild symptoms, Ms Sturgeon said.
"We do want to ensure that young children are fully protected from the virus," she added.

Advice has also been given to officials that unpaid carers who are responsible for elderly or disabled people should be in the next phase of the swine flu programme.

Ms Sturgeon said: "We intend to discuss this advice with carers' organisations and consider how we can identify the carers involved."

She said 43,000 frontline staff in Scotland have already taken the vaccine.

Further details on uptake will be published from next week.

She said 715,500 doses of vaccine have been received in Scotland - equal to 55 per cent of the total required for priority groups.

EDUCATION WEEK

Mark Walsh

School District upheld on Mandatory Vaccinations

Education Week, 19 November 2009, 4:56 PM
https://web.archive.org/web/20091123072354/http://blogs.edweek.org/edweek/school_law/2009/11/school-district-upheld-on-mand.html

A federal district judge has ruled for a West Virginina school district and its officials in a case in which a parent sought to exempt her daughter from mandatory vaccinations for medical and religious reasons.

The ruling earlier this month by U.S. District Judge Joseph R. Goodwin of Charleston, W.Va., is interesting in light of the debate over links between vaccines and autism, as well as public debate over school vaccinations for the H1N1 virus.

The suit was filed by Jennifer Workman, who feared exposing her 6-year-old daughter to mandatory vaccines required for school because the child's older sister developed developmental disorders that the mother attributes to vaccines. The mother submitted a doctor's note seeking to exempt the 6-year-old from vaccines, but the Mingo County School District turned down the request on the advice of the West Virginia state health department, according to court documents.

The mother sued the district and its officials, claiming, among other things, that the vaccination requirement violates her First Amendment right to free exercise of religion. The mother's "Christian Bapticostal religious beliefs require that she honor God by protecting her child from harm and illness, and that immunizing [the 6-year-old] in this instance would violate those sincerely held beliefs," her suit said.

In his Nov. 3 opinion in Workman v. Mingo County Schools, Judge Goodwin said West Virginia is one of only two states that does not offer religious exemptions for school vaccines. (He doesn't identify the other state.)

The judge granted summary judgment to the Mingo County school district on 11th Amendment immunity grounds. Unfortunately for the mother, the school district has been under state control since 2005, which means for immunity purposes it is considered an arm of the state, and under the 11th Amendment, the state may not be sued without its consent. (The judge said a regular county school system in West Virginia – one not under state control – would not have such immunity.)

Judge Goodwin did reach the merits of the mother's constitutional claims with respect to several school official defendants.

"Ms. Workman's freedom of religion claim fails," the judge said. "Her beliefs do not exempt her from complying with West Virginia's mandatory immunization program. It has long been recognized that local authorities may constitutionally mandate vaccinations."

He cited a 1905 U.S. Supreme Court case, Jacobson v. Massachusetts, and a 1944 decision, Prince v. Massachusetts, as well as a number of lower-court rulings that support the idea that, as the judge put it, "Although most states have chosen to provide a religious exemption from compulsory immunization, a state need not do so."

Is Vaccine Testing & Marketing Making People Human Guinea Pigs
Part I

The Florida Sun, 19-25 November 2009, Vol. 78, N 47, p. 7, 12
https://www.bluetoad.com/publication/?m=3254&i=26800&p=6&ver=html5

According to the World Health Organization, most people have no immunity against this new flu virus. Similar to the H5N1 strain, which is widespread among wild birds, the newest H1N1 2009 outbreak stem from an (A)-avian flu virus subtype – of origins unknown.

Because the new H1N1 is a new strain of flu virus, individuals have not yet built up a natural resistance; thus, the pass-along rate greater

One company, Vical Inc., has done early-stage testing on H5N1 avian flu vaccine. According to Vical's President, Vijay Samant: If we start the trial by mid-October 2009, the data should be in our hands by early next year." Nevertheless, Vical states they are in the active process of manufacturing the vaccine, even though the vaccine has not been tested in humans.

"In an emergency," Samant said, "The U.S. Food and Drug Administration can approve a vaccine based on animal data. Only if the viruses prove mild, Vical "might" need to run test in thousands of people."

Vical's shares have more than doubled in price, but said it will spend government grant money on the opportunity to test their NA-based vaccine technology. In order to manufacture H1N1 vaccine, a virus bred in chicken eggs incubates takes six months to produce. That is how they get the virus's genetic code (or recipe) to make Swine Flu Vaccine.

Surely, Swine flu Vaccine is safe, right? In answer to that question, according to an Emmy Award Winning Investigative report, "Swine Flu vaccine contains Squalene. When Squalene is injected into animals, it caused crippling disease."

Board Certified Physician, Dr. Sarah Fletcher said: I strongly advise against getting the vaccine. The vaccine has both aluminum and mercury in it, which are both neurotoxins. Squalene stimulates the immune system to attack itself."

Would we not like to know that before somebody said: "*I would like to put this into your veins or into the veins of your children*?"

Here is what the World Association for Vaccine Education, had to say about Squalene. Squalene: C301150 an Adjuvant, too dangerous for human use. Squalene is not licensed for use in the United States. All adjuvants like Squalene have been ordinarily used to inflict diseases in animals of "for experimentation and study." According to anthrax vaccine expert Gary Matsumoto and other reliable sources, the US military used an unlicensed, experimental anthrax vaccination laced with Squalene, with disastrous consequences, including Gulf War Syndrome.

According to Drs. Debra Birnkrant and Edward Cox, there is very limited data on the safety, usefulness, and rational for emergency use of Peramivir. In other words, Medical Providers admit to the public that they do not know what they do not know.

Yet, according to FDA's Med-Watch program, (www.fda.gov/medwatch/report html), there is still an ongoing process to update clinicians as the FDA learn about this drug's safety.

Trials of Peramivir have not been conducted in patients with H1N1 infection because the virus is new, Peramivir is approved for use as an emergency medication. Selection based on the 'hope' of finding a treatment benefit at lowered doses between 300 mg or 600 mg. It is believed the lower dosage; (in some cases) relieve symptoms 1 day sooner. It has been 'speculated' that Peramivir, (merely an antiviral agent), 'may be' effective in patients with Today's pandemic H1N1 A-virus. Speculation based on limited results available from trials done on patients with common seasonal influenza different from new HiN1.

There are many elaborate and expensive therapies offered, but there is no cure for the virus. Marketing frauds, trying to "*nickel and dime you*" reported by the US FDA and Drug Administration. FDA issued a warning October 2009: "Be extremely careful of products that claim to diagnose, prevent, treat, or even cure H1N1. Several online products, that do not require doctors' prescription, such as Tamiflu (oseltamivir), when tested, FDA found talc and acetaminophen." However, quite suddenly, FDA allegedly granted approval to four different H1N1 vaccines, which virtually no testing. The fast-tracked vaccines approved for use on every one, from infants to expectant mothers.

Because of marketing fraud, health authorities are now facing vaccine resistance as result of the public's wariness about mainstream medicines. Fears about testing and marketing spark a flood of suspicions about vaccine safety. According to Dr. Lawrence Palevsky of American Academy of Pediatrics, "the vaccination itself can hurt you or your child. Even some of the by-products from vaccine manufacturing actually contribute to the impairment of people's immune systems".

The public ask: Is Flu Vaccine Making People Human Guinea Pigs? This question must necessarily be answered because of the experimental vaccine catastrophe of 1976.

Mass immunization resulted from the Swine Flu scare in 1976. After some healthy 20-year-olds received the 1976 experimental Swine Flu vaccine – they ended up as paraplegics. The 1976 Swine had $1.3 billion in claims filed by victims who suffered paralysis from the experimental vaccine.

The Center for Disease Control and Prevention's weekly press briefing confirms that paralysis, crippling Guillain-Barre Syndrome, miscarriages, and sudden death are some adverse possibilities when vaccinated.

Today's campaigns urge Americans to take the shot against this 4th generation strain of the Spanish flu. However, by reading their consent forms, Health Professionals clearly warn people of death risk. Therefore, the need to consider possible complications goes along with every medical decision we make. Learning about controversial vaccines that cause long-term damage, could reduce chances of introducing even more problems.

Is Vaccine Testing & Marketing Making People Human Guinea Pigs
Part II

The Florida Sun, 26 November – 2 December 2009, Vol. 78, N 48, p. 4, 8
https://quad2.mydigitalpublication.com/publication/?m=3254&i=27297&p=8&ver=html5

According to CDC, there is no medical justification – just fear, why many people get the vaccine. Vaccines render useless to persons with H1N1 antibodies, which is why millions do not need a Swine Flu Vaccine.

By selling vaccine to someone who does not need it, pharmaceutical industry do not bother to address the question of immunizing people who are already anti-body positive. Nor that for every person who gets a vaccine the person do not need, there is another person really in need of vaccine that will not get it.

Ever since President Barack Obama declared the National Emergency, vaccine remains in high demand. Causing a fair amount of hypochondria, it is pushed through one mechanism: Fear – and the practice of suppressing science. The trend is people over-reacting, "That is the Mandate of Congress from 1986, when Congress passed the law for safer vaccines, which has never been carried out. Congress requires that people get the proper informed consent," said Jim Moody, Attorney Director, National Autism Association.

According to Barbara Loe Fisher, President of National Vaccine Informational Center: "People have the Human rights to make informed voluntary decisions, whenever there is a medical risk that could hurt you or your child."

Only under certain conditions should people be vaccinated. Moreover, that should only be after the Doctor first determines what type of infection a person has. If you are infected with the flu virus, you need to know if you should take an antiviral drug instead of getting the flu shot. Antiviral drugs are prescription medications that keep flu viruses from reproducing in your body. (Source: CDC).

For example, bacterial pneumonia is a well-known complication of flu. In the case of Pneumonia, "it is important that Health are providers administer treatment for bacterial pneumonia", said Thomas Frieden, Director of the Centers for Disease Control and Prevention.

Additionally, the Public advisory is to first contact their family doctor for recommendations on whether to take the injectable immunization – or the H1N1 nasal mist. The nasal mist contains controversial preservative, Thimerosal.

Many people and children cannot receive the nasal spray. This includes those who have asthma, diabetes, an autoimmune deficiency (such as if that person is ill or taking an antibiotic for an upper respiratory infection). Autoimmune deficiency includes ear infections, strep throat, and bronchitis or sinus infection.

For more info, contact the 24-seven Dept. of Health & Science Services H1N1 Hotline at: 1-877-FLU-4141.

According to Eileen Dannemann, Director of National Coalition of Organized Women, "Children with ADD, ADHD, autism or behavioral disorders, should never be given a vaccine. Especially never one with Thimerosal.

Doctors speaking out to the public, state there are many problems with vaccines. Doctors urge not to make medical decisions based on fear – really do your research. Learn about controversial vaccines being added that could cause long-term damage, introducing even more problems.

What else do Medics advice? First, of all, to consider possible complications after immunization. Symptoms come with that inoculation. Dr. Rene Toko, Founder Hope for Autism, states; "American parents would make very different decisions about how they vaccinate their children, were they given the proper information."

Reportedly, one child had an allergic reaction when the New York school vaccinated her without consent. The child was on epilepsy medication, and the school did not know the effect. The school claimed this was a mistake. However, that mistake could result in a potential lawsuit. One attorney stated that vaccination without consent falls in the category of negligence or assault when children receive vaccinations without parental knowledge or consent."

However, according to the Health Professional's Speak-out public conference of October 2009 held in Virginia, when we do give consent to immunization, we cannot later sue for damages if this vaccine injures us.

Dr. Andrew Wakefield, Royal college of Surgeon and Vaccine Research stated:

"My concerns are the absence of any adequate safety studies looking at the long-term detrimental effects of vaccines, and the cavalier continuance of the process of introducing more untested vaccines into a schedule of vaccinations that is already appalling in terms of its scientific underpinnings.

Stephen Marini, (PhD, DC Immunologist, microbiologist and Adjunct Professor) said: "It is not in the best interests of our children. You are going to be trading some innocent type of diseases that we now known how to handle better, for other problems such as allergies, asthma, autism for years to come."

Are vaccines safe? That is of even bigger concern.

Are the fast-tracked vaccines rushed to market without appropriate testing and safety evaluations, safe and effective?

According to the CDC's recent statement the vaccine, status is still at a level where CDC has begun the process of vaccine production. CDC is sending strains of the new virus to manufactures who will then begin work on vaccines. With these clinical trials still underway, there is no way to accurately predict outcomes of vaccines.

K. D. Jordan

Is Vaccine Testing & Marketing Making People Human Guinea Pigs
Part III

The Florida Sun, 3-9 December 2009, Vol. 78, N 49, p. 4, 6
https://www.bluetoad.com/publication/?m=3254&i=27702&p=1&ver=html5

According to the latest update, Florida logged yet another Swine Flu death on Monday, November 23. The victim this time, a 41-year-old Orange County woman. The mother left behind a baby still fighting for its life. Current data suggest that pregnant individuals have the worse prognosis with mortality. Current CDC statistics shows that about 45% of adults hospitalized with H1N1 had underlying illness before catching the new strain of flu. Of that number, about 6.1% of those were pregnant women.

However, even with vaccination, health professionals state they would have still expected more than 1,000 miscarriages for pregnant women – even within a week after getting the vaccine. The vaccine did not show protective antibodies until after 21 days. For pregnant women, it is difficult to avoid complications from the vaccine. A serious side effect or allergic reaction, such as swelling of the airway can occur in people allergic to egg products.

In November Novavax, incorporated announced studies in Mexico for the new vaccine against H1N1. The new vaccines do not require culture in eggs like most currently approved flu vaccines.

As November 28, 2009, CDC reports ten H1N1 vaccines with negligible side effects. So far, there have been ten Guillain-Barre reports in those who got the new Swine Flu vaccine since early October, resulting in some frontline health and social care staff not taking up offer of the swine flu vaccine. An FDA advisory committee has agreed that H5N1 avian flu vaccines should continue to be tested.

Two anti-viral agents, Zanamivir (Relenza) and Oseltamivir (Tamiflu), have been reported to help prevent or reduce the effects of swine flu if taken within 48 hours of the onset of symptoms. University of Alabama Researchers claim that a combination of Tamiflu, Symmetrel, and repairing (Rebetol, Copepas) showed excellent ability to stop viral growth, even with drug-resistant H1N1 virus. However, this research conducted in lab test has not been tried or approved for human use.

On November 19, Nano Viricides, Inc., states its research success with "FluCide". The experimental antiviral drug reportedly is highly effective against all forms of influenza A. This antiviral is not approved for use in humans.

In November, FDA approved GlaxoSmithKline's vaccine. FDA announced that GlaxoSmithKline's Pandemrix, (used to enhance flu vaccine), was very successful in human trial to boost the immune response to the vaccine. Pandemrix does not approve for use in the U.S.

CSL Biotherapies, Afluria (influenza virus vaccine), and Monovalen vaccine were approved in November. Amarillo Bioscience announced that studies with oral and nasal interferon had good responses in controlling viral infectious in animals. Another study group suggests interferon's use for control of human flu infectious. However, research does not approve for use in the U.S.

A new instrument, Hemopurifier, is a medical device that claims to be able to remove infectious viruses from the bloodstream. During studies, it claims the Hemopurifier removed 68% of H1N1 virus from blood plasma in 30 minutes. However, the Aethlon Medical Hemopurifier does not document use with human patients.

Either being anti-body positive can result in no flu symptoms, or, if a large number of cells infect, less severe symptoms. Such as in the case with the current rapid spread of influenza A.

According to the CDC, by June of 2009, one million Americans had already been exposed to H1N1 swine flu. World Health states *it is likely in the tons of millions of people around the world. Yet you do not see two million Americans dying from Swine flu.*Because they were "symptom-less carriers", they never experienced any flu-like symptoms. CDC states that people's immune system conquered swine flu by creating antibodies that overcome the infection.

Reports released November 18 about H1N1 testing available today, state that current rapid flu tests may be dangerous because they are wrong so often (about 50%) and may cause caregivers to delay important treatment.

As of November, CDC indicated that 8-10 million doses of flu vaccine per week would become available in the next few weeks. According to the CDC, the goal is to immunize over half the U.S. population, many of whom *do not classify as "relatively healthy".*

Today, modern U.S. military researchers have proposed reusing a treatment from the deadly pandemic of 1918. Doctors injected patients with blood plasma, taken from exhumed (dead bodies) of people who had recovered from the flu. Medical Research is currently of the opinion of the use of blood transfusion, as one therapeutic measure.

1918's H1N1 Spanish Flu shares close connection to the recent specad of new Avian H1N1. One similar strain of the current virus circulated before. 1957 wasthe year of the H2N2 influenza or (*Hemagglutinin Neuraminidase flu*). Numbered for classification purpose, H1N1, H2N2, H5N1, differentiate the kinds of flu. The strain connected to wild birds labeled H5N1. However, 1957's H2N2 influenza and 1968's H3N2, is said to have not arisen entirely from bird flu viruses, as did the current H1N1, which also caused the 1918 pandemic. According to studies conducted by researcher H. Deng of the Harbin Veterinary Institute, and Robert Webster of the St. Jude Children's research Hospital, today's newest H1N1 is caused by similar influenza A virus strains of 1918. This influenza identified in currently circulation H5N1.

Today, the new problem is not getting treatment but – to allow good informed judgments that actually benefit society. Health officials say the seriously ill should stay home. People not severely ill should not even come to the hospital care.

Are Swine Flu Parties Event Safe?

The idea of Flu parties is to get exposure to a person with the new H1N1 so that uninfected people can get the disease, then recover, and avoid vaccinations.

Answer to that question will be addressed in the next up-coming article.

K. D. Jordan

Is Vaccine Testing & Marketing Making People Human Guinea Pigs
Part IV

The Florida Sun, 10-16 December 2009, Vol. 78, N 50, p. 4, 8.
https://www.onlineissues.wherewhenhow.com/december-10-2009?m=3254&i=28133&p=4&ver=html5

...

Meanwhile, the world is breaching for a possible second wave of influenza A to hit.A possible second wave of the virus expects to peak again in February 2010. The first peak reported on December 2, reflecting a decline in case numbers from November.

Countries have never seen anything like this mix of swine, bird and human flu before, which is the reason why this virus is so troubling. Another reason is that 25 % of people exposed are infected. On those, 12.5 % can transmit the virus even before experiencing symptoms and continue infection for 7 days. For kids it is as long as two weeks.

According to the American College of Health Association, the attack rate for the week ending November 27th were down by 69 % over the holiday for new cases. This does not surprise the medical community, since influenza viruses have high mutation rates.

For much of the world, no year has been worse than November 1918 when the H1N1 Spanish influenza also broke out. The mysteriously, in the autumn of 1918, the disease died down abruptly. New cases almost dropped to nothing after the peak in the second wave.

Theory holds that the 1918 virus mutated to less lethal strain when it died out, which is a common occurrence for all influenza viruses. The current H5N1 has had high mutation rates, mutating into variety of different types after 1918. Health professionals state "H5N1 knows how to substitute amino acids that normally do not infect humans. A change in characteristics makes itself adaptable to humans now."

There was a new report released about GlaxoSmithKline's swine flu shot on December 4. The European Medicine's Agency warries that young children given Glaxo's flu shot may get fever after the second dose. The drug regulator said data showed a higher number of children had fever after their second dose of Pandermrix. Reportedly, 172,00 doses of vaccines sent to Canada by GlaxoSmithKline was re-called as they can trigger lethal allergic reactions and advised Canadian authorities not to use them.

On December 3, three students were taken to a hospital after receiving H1N1 shots. Louisville, Kentucky Public Health said the elementary school students experienced dizziness and light-headedness after receiving the shot. Another student, who has asthma, experienced shortness of breath.

Japan reported abnormal behavior in young patients. Japan's health ministry says that 151 flu patients under age 18 showed abnormal behavior, such as "acting violently or uttering gibberish," between late September and early November, (Kyodo News reported December 2nd) and that "most patients were believed to have the pandemic virus. 62 were receiving Oseltamivir or Zanamivir." Additional reports from Japan suggest that the use of neuraminidase inhibitors may lead to unusual behavior in children and adolescents.

Polish Civil Rights official, Janecz Kochanowski said refusal to order vaccine, is endangering public health in Poland. Polish government's Prime Minister Donald Tusk's administration has said it "won't import vaccine unless producers take responsibility for any side effects."

A source at the NIH (National Institute of Health) admitted that the vaccine(s) were one of the fastest human vaccines in development. According to correspondent Sharyl Atkinson, "In order to get these vaccines to market so quickly, the U.S. government granted liability protection to swine flu vaccine manufacturers. This protection allowed the drug companies to fast-track production by adding unlicensed components, some of which have been shown to cause autoimmunity in animals. In other words, you might be taking a vaccine (that) has been licensed without normal safety regulations. And if you suffer adverse reactions, the drug manufacture is immune from legal liability."

The U.S. Compressional Report on Mercury in Medicine released in 2003 claimed that there is a link, between Thimerosal and the development of autism, and other brain development disorders. Additionally, use Squalene causes the immune system to react in a powerful and unnatural way. Because of such findings, the CDC states its purpose is to reduce the amount of vaccine needed per dose. The American Journal of Pathology published a study that cited a possible link between adjuvants (such as Squalene) and arthritis, and other chronic inflammatory diseases – "*another unsafe result of vaccine being rushed out the door*."

So, what is the bottom line? Should people take the shot or not?

There is a risk associated with getting vaccine, and there is a risk associated with not getting it. World Health Organization estimates that 30-50% of people infected have mild or no symptoms at

all. However, if you fall into one of the five groups advised by the CDC, you should probably give stronger consideration to being vaccinated since serious health complications, including death, have been occurring in 1% of swine flu patients.

According to World Health Organization, since everyone's situation is different, "Our advice is to educate yourself as much as possible and make an informed decision, based on your age, your medical history, and general strength of your immune system."H1N1 lived in the shadow of the Great War. Under much worst conditions, people's immune systems seemed to have conquered Swine Flu automatically. That may be lesson to be learned from Veteran Day flu pandemic of 1918. Can the natural remedy that helped stop the Spanish flu of 1918 stop 2009's Swine flu?

By means of basic care, when no medical antidote was available, many overcome the illness. The stress was on increasing nutrition. According to the Medical Community's Dr. Joseph Mercola, "being exposed to this new Swine flu Vaccine might prove to be more dangerous than the swine flu itself."

What can be much safer than taking the vaccine? *You are.* You are a walking vaccine factory! When your body, expose to invading viruses your immune system gets right to work. The body known for building powerful antibodies makes its own vaccine.

From a practical perspective, fruits and vegetable are known anti-toxins. For people not allergic to lactose (found in milk products), Lactobacillus, in yogurt is another known form of natural medicine. Lactobacillus stimulates the body's own defense and healing process.

Stay focused for the last remaining Part V in next week's issue.

K. D. Jordan

Is Vaccine Testing & Marketing Making People Human Guinea Pigs
Part V

The Florida Sun, 17-23 December 2009, Vol. 78, N 50, p. 5, 10
https://www.onlineissues.wherewhenhow.com/publication/?m=3254&i=28521&p=1&ver=html5

Boost your immunity to disease – a point that might seem moot, may just be the point. Boosting your own immunity system, helps your body's defense against disease-causing microorganisms. The power of the healing process and increased sanitation practices help control the spread of the influenza virus, which leads to the next question:

Are Swine Flu Patients Ever Safe?

The idea of Flu parties is to get exposure to a person with the new H1N1 so that uninfected people can get the disease, then recover, and avoid vaccinations. Considered risky behaviour, individuals respond differently to the flu. Especially in cases of children. In addition, with people who have known or unknown underlying diseases, attending or hosting such parties may be poor judgments since the person could require hospitalization. Establishing and attending Swine Flu parties is a new trend among some people. Swine Flu parties are just the opposite of what health officials say we should do.

On the contrary, Health Officials say everyone should shield themselves from coughs, sneezes and wash regularly. The seriously ill should stay home. People not severely ill should not even come to the hospital for care.

Seriously ill, means elevated temperature of at least 1005.5, (without fever-reducing meds for 24 hours) and fever that comes back after it went away. Trouble breath or shortness of breath; difficulty keeping fluids down (generally from diarrhoea, and throwing up; Pneumonia symptoms; chest pain; chills; and headaches. Other symptoms are lack of appetite, runny nose and sore throat. Some emergency signs in the case of children are sudden dizziness, fever with rash and bluish skin color.

Underlying health conditions include such conditions as diabetes, heart disease, pregnancy. In such cases, it is important to be seen promptly by a physician and receive treatment within the first 48 hours. Pregnancy hinders the body's natural ability to fight off infection or deal with symptoms of influenza, according to Dr. Schuchat.

The Underlying disabilities, means conditions such as cerebral palsy, epilepsy, seizure disorders, stroke, intellectual disability (mental retardation and moderate to severe development delay), muscular dystrophy, spinal cord injury, long-standing respiratory or cardiac problem.

Vulnerable groups mean infants, children, pregnant women, and those with pre-existing health problems. Pre-existing health problems mean, all diseases ranging from influenza to cancer. ADS, asthma, diabetes, lung disease, heart disease, arthritis, neuromuscular conditions, neurological conditions, and as a medical condition – pregnancy).

In addition, other vulnerable groups not specifically mentioned are, African-American and Hispanics, African-American and Hispanics, are also described as one of the more high-risk groups. Being minorities is more likely to have severe cases of H1N1. Statistically, minority groups suffer from more underlying chronic conditions, such as asthma and diabetes. Minority groups, s a result of experiencing many significant gaps in the system do not always get the help they need. Minorities go without care or seek care in already crowded emergency rooms. With Health Preparedness funding cut by 25%, approximately 47 million Americans without health coverage add to the problem of the Flu surge.

However, for people without insurance, the Orange County Health Department can direct you to community health centers. Orange County has the Primary Case Access Network. Eleven clinics in Orange County serve people without insurance and the P.E.CA.N. system is a part of the network.

Nevertheless, anyone at any times is vulnerable, "any time their immune system is a little weakened, said Dr. Anne Schuchat, "…people become more sensible to other infectious." In addition, at the onset of the systems, Dr. Schuchat recommends, "It's best to consult, at least initially by phone or e-mail, with a health care provider as a better strategy than going to an emergency room."

Otherwise, according to all health professionals, "by coming into health facilities, you are having unnecessary contact with people who may be infectious. For most people with the flu, there is no reason to see a doctor. Seeking care in already over-crowded emergency rooms, only run the risk of contracting a Hospital Acquired infection."

Finally, what really happens when you give an H1N1 vaccine to a person who already has built-up H1N1abtibodies?

According to medical professionals, the vaccine dangerously exposes uninfected individuals to all of the risks of vaccine with none of the benefits. Since vaccine cannot help in any way (because the person is already immune), the vaccine can only harm them.

Keeping in mind that Attenuated H1N1 influenza vaccine – (the flu mist or nasal spray) actually contains live virus; it still makes recipients-contagious. Professionals say recipients may shed live viruses for up to three weeks following treatments.

Exposure to others, also place others at risk, aiding in the spread of the new virus.

39.000 H1N1-Impfungen in zwei Wochen

Wien-ORF, 20 November 2009
https://web.archive.org/web/20100203112001/http://wien.orf.at/stories/404442/

Rund 39.000 Menschen haben sich in Wien in den ersten beiden Wochen gegen die Schweinegrippe impfen lassen. Ein Sonderpädagogisches Zentrum in Floridsdorf wurde am Freitag für eine Woche gesperrt.

Massiver Rückgang bei Impfungen

Die beiden Wochen hätten gezeigt, dass die Inanspruchnahme der Impfstellen schwer vorhersehbar sei, sagte Landessanitäts-Direktorin Karin Spacek.

In der ersten Woche hätten sich 28.900 Menschen impfen lassen, in der zweiten Woche rund 10.000. Am Donnerstag der ersten Woche gab es mit 6.800 Menschen den höchsten Ansturm, am Donnerstag dieser Woche waren es nur mehr 1.783. Spacek sprach von einem massiven Rückgang.

Impfaktion läuft weiter

Insgesamt rund 400 Mitarbeiter, von Ärzten bis zu Sanitätern, waren im Impfeinsatz. Sie immunisierten etwa gleich viele Frauen wie Männer. Am stärksten vertreten waren über 60-Jährige mit einem Anteil von 24 Prozent, gefolgt von den 40- bis 49-Jährigen mit 19 Prozent, hieß es in einer Bilanz der WGKK.

Die Impfaktion für die Bevölkerung mit besonderem Schwerpunkt auf die Risikogruppen hatte am 9. November begonnen. Die Dauer der Impfaktion ist vorerst nicht beschränkt.

Sonderpädagogisches Zentrum gesperrt

Das Sonderpädagogische Zentrum Herchenhahngasse in Wien-Floridsdorf ist unterdessen für eine Woche geschlossen worden. Von der einwöchigen Sperre sind 172 Kinder betroffen, 80 sind derzeit erkrankt.

"Die Maßnahme entspricht der aktuell geltenden Vorgabe des Gesundheitsministeriums, Schulschließungen auf Einrichtungen zu beschränken, in denen Kinder mit chronischen Grunderkrankungen betreut werden", hieß es in einer Aussendung der Magistratsabteilung 15 - Gesundheitsdienst der Stadt Wien.

Knapp 700 Schweinegrippe-Kranke in Wien

Insgesamt gibt es in Wien seit Ausbruch der Schweinegrippe knapp 700 Fälle. Hauptbetroffen sind die 15- bis 34-Jährigen. Jeder zweite Patient ist in dieser Gruppe.

Die Neue Grippe wirkt sich praktisch nicht auf die Krankenstände aus. Rund 30.000 Menschen sind derzeit krank gemeldet. Ein Drittel davon wegen diverser Verkühlungen, Infekten und eben der Grippe.

Dramatic drop in Austrians taking the swine flu jab:
about 0.4% show up in Salzburg in second week

The Flu Case, 20 November 2009 15:31
https://web.archive.org/web/20100102050011/http://theflucase.com/index.php?option=com_content&view=article&id=1989%3Adramatic-drop-in-austrians-taking-the-swine-flu-jab-about-04-show-up-in-salzburg-in-second-week&catid=41%3Ahighlighted-news&Itemid=105&lang=en

salzburg ORF.at

http://salzburg.orf.at/stories/404541/ (deleted)

The numbers of people taking the swine flu jab in the Salzburg region in Austria in the second week of the mass swine flu vaccination programme has dropped dramatically, indicating a collapse in confidence in the safety and usefulness of the jab.

The ORF reports 2,100 people took the jab in the second week in the entire Salzburg region according to the figures of the health insurance associations. This is less than a third of the 6,400 people who took the jab in the first week.

Health official Harald Seiss said the "rush" on the swine flu jabs was over.

However, it is not clear there was ever any rush in the first place.

Even the 6,400 people who took the jab in the first week represent just 1.3 per cent of the population of the federal state of Salzburg amounting to 529,000 people.

In Vienna, the capital, the drop in people taking the swine flu shot was even more dramatic with only 10,000 people turning up for the jab this week compared to 28,900 in the first week.

Germany signed a secret contract to prepare for a pandemic of deadly flu - in 2007

Bild, 20 November 2009, 10:42 Uhr
https://web.archive.org/web/20091122201434/http://www.bild.de/BILD/news/bild-english/world-news/2009/11/20/swine-flu-pandemic/germanys-secret-virus-vaccine-contract-revealed.html

BILD has revealed the agreement with pharmaceutical firm GlaxoSmithKline (GSK) which was apparently signed from an underlying fear of the bird flu virus. It came into affect when the swine flu pandemic began.

And you can read portions of the 'Agreement between the German government and its states and GSK' regarding the preparation of a vaccine for the killer virus in Germany:

QUANTITY
"GSK offers all states... the possibility... to buy 25 per cent of its Dresden-produced pandemic vaccine, to a maximum quantity necessary to supply 50 per cent of the German population."
Meaning: At most, half of Germany will be provided for.

PRICE
"The buying price... is €7 plus tax per dose, €1 of which is covers the antigen components and €6... the booster components."
Meaning: The serum itself only costs €1 per dose; it's the booster that is expensive.

DELIVERY TIMEFRAME
It is agreed upon that "an obligation does not exist on the part of GSK to supply the theoretically-calculated weekly supply of the pandemic vaccine within a certain timeframe".
Meaning: GSK doesn't have to uphold any delivery dates.

SIDE EFFECTS
"The states hold GSK... free of any claim for damages by third parties, losses or financial costs, or any legal actions incurred."
Meaning: Should any unexpected major side effects arise, the manufacture has only very limited responsibility. In lawsuits the province would take main legal responsibility.

SECRECY
"The parties commit themselves to treat all information which is exchanged in the frame of this contract as confidential."

TIME SPAN
The contract... ends with its carrying out in the first case of a pandemic or by Dec 31, 2012 if no acute case has been present."

Press Release

European Medicines Agency reaffirms efficacy and safety of H1N1 pandemic vaccines

Doc. Ref. EMEA/748707/2009

EMEA, 20 November 2009

https://web.archive.org/web/20091229060545/http://www.emea.europa.eu/pdfs/human/press/pr/74870709en.pdf

London, 20 November 2009
Doc. Ref. EMEA/748707/2009

PRESS RELEASE

European Medicines Agency reaffirms efficacy and safety of H1N1 pandemic vaccines

The European Medicines Agency has reviewed further data on the centrally authorised pandemic vaccines, Celvapan, Focetria and Pandemrix. The Agency has reaffirmed their positive balance of benefits and risks in the context of the current H1N1 influenza pandemic.

The European Medicines Agency has reviewed further data on the centrally authorised pandemic vaccines, Celvapan, Focetria and Pandemrix. The Agency has reaffirmed their positive balance of benefits and risks in the context of the current H1N1 influenza pandemic.

The data on Focetria and Pandemrix indicate that a single dose of these vaccines is able to trigger an immune response that may be sufficient to give protection against the H1N1 pandemic influenza in some age groups. For both vaccines, a single dose may be used in adults aged between 18 and 60 years and in children and adolescents (from the age of 9 years for Focetria, and from 10 years for Pandemrix). Pandemrix may also be used as a single dose in the elderly. For certain groups, such as younger children and immunocompromised patients, the recommendation remains that two doses should be given, to ensure that their immune system responds adequately to the vaccination. Further data will become available in the coming months. Data on Celvapan are still being assessed.

The Agency also concluded that Focetria and Pandemrix can be co-administered with non-adjuvanted seasonal flu vaccines.

The Agency, together with the national competent authorities, is continuously monitoring the safety profile of H1N1 pandemic influenza vaccines. With vaccination campaigns ongoing in the European Union, about 5 million people have been vaccinated so far. To date, the side effects reported have mainly been mild symptoms such as fever, nausea, headache, allergic reactions and injection site reactions, confirming the expected safety profile of the three vaccines. A very small number of cases of Guillain-Barré syndrome and foetal death have been reported in patients previously vaccinated with a pandemic vaccine. The Agency is still in the process of gathering all relevant information

and evaluating the data. However, on the basis of the available information there is no evidence to link these to the vaccines.

The Agency will continue to evaluate all information that becomes available and make further recommendations as necessary.

THE FLU CASE

EMEA unexpectedly announces one dose "sufficient"

The Flu Case, 21 November 2009, 14:19
https://web.archive.org/web/20091229060545/http://www.emea.europa.eu/pdfs/human/press/pr/74870709en.pdf

The European Medicines Agency – the EU drug regulator which is funded two-thirds by pharmaceutical companies – has said that a single dose of the swine flu vaccines, Focetria and Pandemrix, is sufficient to "produce a good immune response in adults".

The EMEA's decision to spare Europeans the full dose of the toxic and untested vaccine substance could be connected to growing protests over the side effects and deaths resulting from just one dose of the swine flu jab in Europe.

Did U.S. make mistake in skipping vaccine additive?

Reuters, 20 November 2009, 12:36 pm EST
https://www.reuters.com/article/domesticNews/idUSTRE5AJ2LM20091120/

Washington (Reuters) - As U.S. health officials struggle to vaccinate tens of millions of Americans against the pandemic of swine flu, some are looking regretfully at one easy way to instantly double or triple the number of doses available -- by using an immune booster called an adjuvant.

These additives, often as simple as an oil and water mixture, broaden the body's response to a vaccine, reducing the amount of active ingredient called antigen needed.

They are widely used in European flu vaccines as well as in Canada. But not in the United States – even though the federal government has spent nearly $700 million buying them.

The reason – people might not trust them.

"If we really do want pregnant women to trust this vaccine or even parents, we have to think about what is acceptable to them," Dr. Anne Schuchat of the U.S. Centers for Disease Control and Prevention said in an interview.

"We have so much vaccine hesitancy in this country," agreed Jeff Levi of the non-profit Trust For America's Health. "To add ... a new element could well have undermined the efficacy of this campaign," Levi told a hearing this week before a Congressional subcommittee.

This frustrates the World Health Organization, which says the global capacity to make influenza vaccines is about 3 billion doses a year -- not enough to cover the population of 6.8 billion people. WHO has hoped rich countries would donate leftover H1N1 vaccine to others.

The U.S. Health and Human Services Department was ready to try adjuvants had the pandemic been worse. H1N1 swine flu has infected an estimated 22 million Americans and killed 3,900, but it so far does not appear to be any deadlier than seasonal influenza.

The worry is that it is affecting younger adults and children instead of the elderly usually targeted by flu, and has the potential to mutate into something more deadly.

"If things had been worse and this would have been a more severe pandemic, we may well have needed to go that way anyway," Levi said.

Tried and True

Instead, the United States has stuck with what CDC director Dr. Thomas Frieden has repeatedly called the "tried and true" approach -- the same formulation used in seasonal flu vaccines. Five companies have contracts -- Sanofi-Aventis, CSL, Novartis, AstraZeneca unit MedImmune and GlaxoSmithKline.

Polls show that only about half of Americans plan to be vaccinated against H1N1. Of those who do not, about half say they worry about safety.

Even so, long lines have formed as people try to get the 50 million or so swine flu doses that have rolled out of factories. Drug companies have struggled with an unpredictable virus that does not grow well in eggs, as well as changes to U.S. orders that slowed down packaging.

Studies suggest the supply that is out now could have been tripled.

In September, GlaxoSmithKline found a single shot of its H1N1 vaccine protected 98 percent of volunteers, using an adjuvant and just 5.25 micrograms of antigen. A standard dose without adjuvant takes 15 micrograms of antigen.

Vaccine makers urged Congress this week to help federal agencies find ways to approve the use of adjuvants, and to assure skeptical Americans about their safety.

Dr. Vas Narasimhan, president of Novartis Vaccines USA, noted adjuvants had been licensed for use in Europe for 10 years and tested in 200,000 people.

"Adjuvanted vaccines produce higher immune response than unadjuvanted vaccines particularly in the elderly and young children," Narasimhan told a hearing this week.

He said they may protect better than standard vaccines against viruses that have drifted a little – the single biggest reason that flu vaccines must be re-formulated every year.

They may also eventually help require less vaccination. "Adjuvanted vaccines have been shown to more broadly prime patients' immune response (up to seven years later), requiring fewer vaccinations to the newly circulating strain," he said.

The National Institute of Allergy and Infectious Diseases is intrigued. Last month it awarded $60 million to researchers and companies to develop new adjuvants.

THE FLU CASE

Is the US government about to lift the ban on adjuvants?

The Flu Case, 21 November 2009 14:27

https://web.archive.org/web/20100102035553/http://theflucase.com/index.php?option=com_content&view=article&id=2016%3Ais-the-us-government-about-to-lift-the-ban-on-adjuvants-&catid=1%3Alatest-news&Itemid=64&lang=en

Even as doctors in German say adjuvants are not needed to make enough swine flu jabs go around, Reuters is reporting that US health officials are claiming that the use of the illegal adjuvant could boost the "number of doses available".

In what appears to be a propaganda piece to help pave the way for the US government to authorise the use of "adjuvants" – currently prohibited in the USA and the UK –, Reuters floats the idea that only the use of adjuvants will help the government meet the demand for swine flu jabs.

The US government has bought 700-million dollars worth of adjuvants, reports Reuters, and so is obviously anticipating finding a chance to use the illegal substance under special pandemic emergency regulations.

There is a large body of scientific evidence showing that squalene causes autoimmune and other diseases and is also responsible for the Gulf War Syndrome, which afflicted 25% of all US and UK vets.

The swine flu jab Pandemrix with the adjuvant squalene has been associated with at least 7 deaths in Germany and 8 in Sweden already.

German doctors have said 30% of the people who took the Pandemrix jab have had side effects.

The only significant studies in favour of adjuvants appear to have been financed by pharmaceutical companies and WHO or by scientists linked with these.

Many of these studies appear to have been designed in flawed ways, for example, carried out on people who are only over 70 years of age and living in old people's homes.

But how independent and valid are such flawed studies funded and carried out by the manufacturers of adjuvants?

The Free Press

Larry Kusch

Clinics running low on one vaccine type

The Free Press, 20 November 2009, 1:00 AM CST
https://www.winnipegfreepress.com/arts-and-life/life/health/2009/11/20/manitoba-sees-second-death-this-season

Winnipeg flu clinics are expected to run out of vaccine containing an adjuvant to boost its effect early today. However, vaccine without adjuvant will still be available for pregnant women and anyone aged 10 to 64 without a compromised immune system.

The province should receive more vaccine with adjuvant early next week.

Manitoba reported its second H1N1 death of the season on Thursday – and another large increase in confirmed cases of the virus – but there was also some good news.

The province released no information about the person who died, other than to say he or she was between 18 and 65 years old and had no known underlying health conditions.

It also said the number of lab-confirmed cases Nov. 10 to 16 had risen by 251, raising the total since Oct. 6 to 543. However, on the bright side, only five patients suspected or confirmed to have H1N1 were admitted to provincial intensive care units in the past week compared with 11 the week before. And as of Thursday, there were only seven H1N1 patients altogether in ICUs.

Health Minister Theresa Oswald Thursday referred to the number of ICU patients as one of the most significant indicators – more important than the number of confirmed cases.

Dr. Joel Kettner, Manitoba's chief public health officer, said while it's too early to detect a trend from the past week's decline in ICU patients, at least the situation is not getting worse.

"It is an indication that at least compared to the previous week we don't have rising rates (of Manitobans becoming extremely ill from H1N1)," he told reporters Thursday.

In another development Thursday, the province announced manufacturer GlaxoSmithKline had asked provinces to temporarily discontinue vaccinating Canadians from a specific batch of vaccine shipped in October.

The reason is that there has been a higher ratio of severe adverse reactions to the vaccine among Canadians than from other lots.

However, most of the vaccine Manitoba received from the suspect shipment had already been used by the time the province received the alert on Wednesday. Of the 63,000 doses shipped, only 630 remained unused by the four regional health authorities in Manitoba that received them, including Winnipeg's.

Kettner said the suspect lot produced serious and immediate anaphylactic reactions in 1 out of 20,000 vaccinations, compared with 1 out of 100,000 in other shipments.

As of Nov. 16, there have been 88 adverse reactions in Manitoba to H1N1 vaccine, of which seven were considered serious. Five of those have been confirmed as anaphylactic reactions.

Kettner said no one in Manitoba has suffered any prolonged adverse effects from the H1N1 vaccine.

Meanwhile, the city's 12 mass H1N1 immunization clinics reported a bump up in numbers Wednesday and Thursday, the first days they were open to all Winnipeggers, according to the Winnipeg Regional Health Authority. About 10,000 were immunized Wednesday and 10,500 Thursday, compared to 7,000 to 8,000 in the days leading up to the removal of restrictions on who could be immunized.

Most Winnipeggers interviewed at clinics at Grant Park, St. Mary's Road and in St. James late Thursday morning said it took an hour or less from the time they arrived to the time they left.

Teufen. Das Impfzentrum Teufen, wo sich Ausserrhoder gegen den H1N1-Virus impfen lassen können, wird nächste Woche geschlossen. Der Grund: Mangelnde Nachfrage, wie der Sonderstab für Pandemieplanung mitteilt.

Das Zentrum könne aber bei Bedarf jederzeit wieder geöffnet werden, heisst es in der Mitteilung weiter. Offen bleiben die Impfzentren in Heiden und Herisau. Geimpft wird dort montags, mittwochs und freitags jeweils von 15 bis 20 Uhr. (pd/sg)

THE FLU CASE

Vaccine centre closes in Switzerland already: no demand

The Flu Case, 21 November 2009 13:32
https://web.archive.org/web/20100102024957/http://theflucase.com/index.php?option=com_content&view=article&id=2009%3Avaccine-centre-closes-in-switzerland-already-no-demand&catid=1%3Alatest-news&Itemid=64&lang=en

The swine flu vaccine centre in Teufen, Switzerland, is going to be shut down from Monday because so few people want to get the swine flu jab according to the Swiss special committee for pandemic planning, reports Tagblatt.

Switzerland has only just started its swine flu vaccination campaign, later than other countries in Europe.

Zu wenig Aufklärung bei H1N1-Impfungen

SRF Tagesschau, 22 November 2009, 6:02 Uhr
http://tagesschau.sf.tv/content/view/full/2482138 (deleted)

[Schweiz] Bei der Impfung gegen die Schweinegrippe werden die Sicherheitsanforderungen des Bundesamts für Gesundheit (BAG) offenbar verletzt. Das berichtet die «SonntagsZeitung». In der Stadt Zürich seien Impfwillige etwa nicht über mögliche Nebenwirkungen informiert worden.

Zudem sei bei ihnen nicht abgeklärt worden, ob eine chronische Erkrankung und Allergien bestehen, oder bei einer Frau, ob sie schwanger ist.

Der Vizepräsident der Eidgenössischen Kommission für Impffragen, Hans Binz, hält diese Unterlassungen für «verantwortungslos», berichtet das Blatt weiter. Im schlimmsten Fall könne eine Allergie einen tödlichen Schock auslösen.

Kantone für Sicherheit verantwortlich

Gleichzeitig werde auch die Rückverfolgbarkeit des verimpften Serums nicht gleich gehandhabt. Arztpraxen notierten lediglich Name und Geburtsdatum – ohne Adresse. Bei Problemen mit dem Impfstoff müssten die Behörden eine öffentliche Rückrufaktion machen. Laut BAG müssen die Kantone für die Sicherheit beim Impfen sorgen.

Grosse Unterschiede zeigen sich auch bei der Verteilung des Impfstoffs, den die Kantone selbst organisiert haben. Eine schweizweite Umfrage zeige: Basel-Stadt hat für ein Viertel seiner Bevölkerung Impfstoff verteilt, der Kanton Jura bildet mit 6 Prozent das Schlusslicht.

Swiss Government violated Laws by failing to give information about side effects of Swine Flu jab

The Flu Case, 23 November 2009, 12:52
https://web.archive.org/web/20100102051839/http://theflucase.com/index.php?option=com_content&view=article&id=2028%3Aswiss-government-violated-laws-by-failing-to-give-information-about-side-effects-of-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Hans Binz, the head of Swiss Commission for Vaccination Issues, has accused the Federal Health Ministry of acting "irresponsibly" by failing to inform people about the possible side effects of the swine flu jab.

People going to get their jab in Zurich are not being informed about the possible side effects, reports Swiss TV.

The requirement to give adequate information about the side effects of the jabs has been violated, according to the newspaper Sonntags Zeitung.

Polskaweb NEWS

Polen bietet Schweinegrippe - Verfolgten Asyl

PolskaWeb News, 22 November 2009
https://web.archive.org/web/20091122161206/http://polskaweb.eu/der-schweinegrippe-hysterie-entkommen-655846734443.html

Schweinegrippe Urlaub in Polen

Posen - Polen ist besorgt über die Opfer der Schweinegrippe Hysterie in Deutschland. Österreich und der Schweiz. Tagtäglich verfolgt man vor allen Dingen die Ereignisse beim deutschen Nachbarn, desse Fernsehprogramme auch in Danzig oder Breslau empfangen werden. Ein aufkommendes Mitleid mit den Menschen jenseits der Oder ist bereits unübersehbar. In diversen Interforen bieten bereits seit Tagen unzählige Polen den durch dubiose Medien, Instituten, Gesundheitsämtern, Politikern oder der Weltgesundheitsorganisation WHO Verfolgten und in die Enge getrieben ausländischen Nachbarn mehrwöchiges Asyl und gesunde Kost in Polen an. Unzählige Hotels im Lande haben sich inzwischen ebenso bereit erklärt, Deutsche, Österreicher und Schweizer Schweinegrippe Asylanten ohne sonderliche Formalitäten jederzeit aufzunehmen. Neben Schutz vor den Verfolgern beinhalten derartige Angebote auch umfangreiche Sicherheit vor der Schweinegrippe- Impfung und Massenpanik.

Polen bietet Rundumschutz

Ganz besonders erwähnenswert sind die Preise für Kost- und Logis der H1N1-Asylanten. Die meisten Hotels und Pensionen in Polen bieten derzeit schon saison- und bedarfsbedingt Rabatte von bis zu 60 Prozent für ihre Gäste an. Auch die Organisation von Shuttle- Services zu den umliegenden Apotheken zwecks Einkauf von sehr günstigen und sicheren polnischen Grippemitteln als Rundumschutz für die spätere Heimkehr, ist bei fast allen Quartieren im Preis mit einbegriffen. In Polen selbst reichen zum Schutze gegen die Schweinegrippe 3 Mahlzeiten täglich und für Erwachsene am Abend ein Gläschen polnischen Wodkas meist voll und ganz aus. Angesichts der bevorstehenden Weihnacht, empfiehlt sich natürlich auch ein Einkauf in Polen. Die großen Renner bei ausländische Touristen sind in diesem Zusammenhang jetzt Atemschutzmasken aus Engelshaar mit Sternchen und Tamiflu- Pillen aus Marzipan.

Panikmacher unerwünscht

Für abenteuerlustige Grippe- Asylanten bieten z.B gleich mehrere Hotels in Kolberg (Kolobrzeg) einen Ausflug zum einzigen Schweinegrippe- Kranken Polens ins 400 Kilometer entfernte Lublin an (Er darf angefasst werden). Vorzügliche Quartiere in Polen finden Sie in der Reisesparte von "Polskaweb" über Google und wenn Sie wollen sicherlich auch bei ihrem Reisebüro. Ausgenommen von diesem Asylprogramm sind sämtliche leitenden Mitarbeiter von Pharma Konzernen, der europäischen Gesundheitsbehörde EMEA, der WHO, dem Robert-Koch und Paul Ehrlich-Institut, Gesundheitsämtern, alle Gesundheitsminister inklusive Ulla Schmidt, Medien wie ARD, RTL, Bild Zeitung, die Welt, Rheinische Post, FAZ, Focus, die Zeit, Frankfurter Rundschau und etwa 1600 Ärzten, deren Namen wir an dieser Stelle nicht alle aufführen wollen, da sie meist bereits in einem anderen Bonusprogramm berücksichtigt wurden.

Glückseelige Insel Polen

Polen ist eine gesunde Insel, dagegen sieht es bei den direkten Nachbarn Deutschland und der Ukraine erstaunlicherweise, wenn man denn den Medien und Behörden glauben darf, nach Epidemien jeglicher Couleur aus. Die Geldgier der Pharma- Industrie und ihrer unzähligen kleinen und großen Helfer macht einfach alles möglich. Merken Sie eigentlich nicht dass man Sie zum Narren hält, betrügt und bestiehlt?

THE FLU CASE

Poland braces itself for Swine Flu jab asylum seekers

The Flu Case, 10 December 2009 13:21
https://web.archive.org/web/20100102031932/http://theflucase.com/index.php?option=com_content&view=article&id=2232%3Apoland-braces-itself-for-swine-flu-jab-asylum-seekers&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Poland is bracing itself for a flood of people fleeing forced vaccination and quarantine regimes, and a newly founded political party is reported to be planning to set up refugee camps across the country in the event that governments in the USA and Europe attempt to move over to forced vaccination programmes in spite of growing resistance among the general public.

Inquiries about the possibility of staying in Poland in the event of a pandemic crackdown are coming in from the USA, Sweden and other countries.

While the US, UK and European governments appear to have been forced to slow down mass swine flu jab programmes by the non cooperation of the general public, there are no signs of their abandoning their plans to give entire populations the jabs altogether.

Many hotels across Poland have already agreed to take in swine flu asylum seekers for a few weeks and are offering special rates.

Volksstimme

Volksstimme Umfrage in Oschersleben zur neuen Grippe:
"Lassen Sie sich gegen die Schweinegrippe impfen?"

Volksstimme, 23 Novembre 2009, 04:56
https://www.volksstimme.de/lokal/wanzleben/lassen-sie-sich-gegen-die-schweinegrippe-impfen-374152

Oschersleben. "Die normale Grippeimpfung ist ausreichend", denken viele. Ist das aber wirklich der Fall ? Wird das Thema Schweinegrippe durch die Medien zu sehr aufgebauscht oder verbirgt sich hinter der Krankheit doch eine große Gefahr für uns ? Die Volksstimme hakte auf dem Oschersleber Markt nach und wollte von Passanten wissen: "Lassen Sie sich gegen die Schweinegrippe impfen?"

Yunus Kocar (19) wollte sich ursprünglich nicht impfen lassen. Jedoch erkrankte sein Betreuer an Schweinegrippe. Nun wollte der junge Mann lieber auf Nummer sicher gehen. Die Impfung rief bei ihm jedoch Durchfall, Erbrechen sowie Schwindelkeitsgefühl vor. "Zudem hatte ich eine Schwellung beziehungsweise Rötung an der Injektionsstelle", berichtet der Jugendliche von seinen Erfahrungen mit dem umstrittenen Impfstoff.

Petra Himmelreich war grundsätzlich für die Impfung, da aber kein Impfstoff vorhanden war, "belies ich es bei der, normalen' Grippeschutzimpfung" berichtet die Oscherslebérin und weiter: "Die Angst bleibt, da ein Familienmitglied sich bereits infiziert hat".

Marlies Behrens bemerkt, dass sie es unerhört findet, dass die Beamten sowie Politiker "reinere" Sera bekommen als andere Mitbürger.

Darüber hinaus spricht sich die Urgroßmutter gegen die Impfung ihrer Enkelin aus, "da die Kleine ohnehin schon viele Impfungen in den ersten Lebensmonaten über sich ergehen lassen muss".

Volksstimme wollte auch eine fachliche Meinung einholen und kontaktierte dazu Dr. Sabine Gummert. Die Kinderärztin ist der Meinung, dass die Angst vor der Schweinegrippeimpfung nicht gerechtfertigt ist. "Ich selbst habe mich gegen das neuartige Virus impfen lassen", so die Ärztin. Auf die Frage nach dem Warum antwortet sie: "Ich bin überzeugt von dem Schutz der Impfung, obwohl auch ich eine Impfreaktion verspürte." Lokale Reaktionen im Laufe dieser Impfung seien völlig normal und sollten die Menschen nicht davor ängstigen, sich selbst zu schützen. In ihrer Praxis werde bereits seit drei Wochen geimpft.

Wegen der Verknappung des Impfstoffes wurden anfangs insbesondere chronisch Kranke sowie medizinisches Personal geimpft. Die oft diskutierten beigefügten Wirkungsverstärker, die sogenannten "Adjuvanzien", heben bei manchen Patienten zum Beispiel eine Rötung hervor, wirken jedoch effizient gegen das Virus.

Ärztin Sabine Gummert räumt im Gespräch mit der Volksstimme auch mit dem Vorwurf auf, dass beispielsweise höhere Beamte einen besseren Impfstoff verabreicht bekommen. "Sie bekommen lediglich einen anderen Impfstoff, der nicht die Adjuvanzien enthält", so Gummert.

Übrigens: Während in Deutschland die Impfung in den Arztpraxen und Krankenhäusern erfolgt, haben sich findige US-Amerikaner ein ganz besonderes System ausgedacht, um dem großen Ansturm Impfwilliger entgegen kommen zu können : In Großstädten werden Supermarktparkplätze abgesperrt, auf denen die Patienten im Auto direkt geimpft werden können.

The New York Times

Swine Flu vaccinations rise while infections remain low

The New York Times, 23 November 2009, 12:04 pm
https://archive.nytimes.com/cityroom.blogs.nytimes.com/2009/11/23/swine-flu-vaccinations-rise-while-infections-remain-low/

More than 11,000 people received swine flu vaccines at free clinics this past weekend, city officials said, while overall infection rates remain relatively low.

The Department of Health and Mental Hygiene has ordered more than a million doses of the vaccine. Most of them are going to in-school vaccinations, weekend clinics, hospitals and private pediatricians; some have been sent to large companies.

Because demand for the vaccine was lower than anticipated, the weekend clinics, originally intended for middle- and high-school students, were opened to a larger group of people considered high risk. That group included anyone between ages 4 and 24, those between 25 and 64 who have health conditions that make them more vulnerable, pregnant women and anyone who lives with or cares for a newborn less than 6 months old. The clinics – which vaccinated only 3,450 people on their first weekend earlier this month – will be on hiatus over the Thanksgiving weekend and then will resume for the first two weekends in December.

Some community clinics also have the vaccine. At the CABS Health Center on Manhattan Avenue in Brooklyn on Monday morning, a woman answering the phone said the center was open to anyone who wanted a shot, until 11:30 a.m. About 10 people were waiting in line, she said. A list of weekend and local clinics is available at nyc.gov/flu.

But vaccination is far from complete in schools. Jessica Scaperotti, a spokeswoman for the health department, said the in-school vaccinations would probably continue until the end of December.

Some school administrators said that parents had become angry at the slow pace of vaccination. "It has been delayed and delayed and delayed," said Linda Kaufman, the associate head of school at St. Ann's School in Brooklyn Heights. "There have been many frustrated parents who probably could have gotten the vaccine sooner from their pediatricians."

In a letter to parents last week, Ms. Kaufman said that the health department promised that the vaccine would finally be available at the end of November.

She added: "Although I don't wish to make light of the delay, here are two quotations to contemplate: 'If we can ever make red tape nutritional, we can feed the world' and 'Any sufficiently advanced bureaucracy is indistinguishable from molasses.'"

Last week, the Centers for Disease Control and Prevention said that swine flu was subsiding in most of the country, and in New York, the numbers of people entering emergency rooms with flu-like symptoms have been far below those in the spring, when swine flu walloped the city. School attendance rates have been running about normal as well.

RHEINISCHE POST

Impfung: Nachfrage sinkt weiter

23 November 2009, 12:16
https://web.archive.org/web/20091126041428/www.rp-online.de/duesseldorf/duesseldorf-stadt/nachrichten/Impfung-Nachfrage-sinkt-weiter_aid_786377.html

Düsseldorf (RPO) Der Ansturm auf die Grippeschutzimpfung ist in Düsseldorf weiter rückläufig. "Am Samstag waren nur 128 Düsseldorfer in der zentralen Impfstelle. In der Vorwoche waren es noch mehr als 500", erklärte Sprecher Michael Bergmann am Montag.

Bis Freitag hatten sich mehr als 20.500 Düsseldorfer in der zentralen Impfstelle an der Erkrather Straße eine Schutzimpfung abgeholt. Trotz eines sprunghaften Anstiegs der positiven Schweinegrippe-Tests kämen täglich weniger Düsseldorfer in die Impfstelle, erklärte Bergmann.

Während vor einer Woche noch 770 Tests positiv gewesen wären, läge die Zahl nun bereits bei 1209. "Das ist ein Anstieg um rund 500 Patienten in nur einer Woche. Und das, obwohl immer weniger Tests durchgeführt werden. Dennoch lassen sich die Menschen nicht impfen. Das ist nicht nachvollziehbar", sagte Bergmann weiter.

Geschuldet sei die sinkende Zahl der Impfungen vermutlich auch den vielen Meldungen über einen harmlosen Verlauf der Schweinegrippe. "Viele Menschen kennen jemanden, der die Schweinegrippe ohne weitere Komplikationen überstanden hat. Sie unterschätzen das Virus", hieß es weiter. Denn: "Die Zahl der Patienten, die an eine Herz-Lungen-Maschine angeschlossen wurden, ist ebenfalls stark angestiegen."

"Wer sich schützen will, sollte sich möglichst schnell impfen lassen", mahnte Bergmann im Gespräch mit unserer Redaktion.

THE FLU CASE

Demand for Swine Flu jab in Germany declines even further

The Flu Case, 23 November 2009, 12:48
https://web.archive.org/web/20100102023937/http://theflucase.com/index.php?option=com_content&view=article&id=2027%3Ademand-for-swine-flu-jab-in-germany-declines-even-further&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Only 128 people went to get the swine flu jab in the central swine flu vaccination center in the city of Düsseldorf, in Germany, down from 500 the previous Saturday, according to RP Online.

Altogether 20,500 people in Dusseldorf had taken their jab in the swine flu center up to Friday last week, a tiny fraction of the total population of the city of about 584,000 people.

The largest numbers came at the start of the swine flu campaign with fewer coming every day subsequently, however, even the "rush" at the beginning consisted of relatively tiny numbers of people.

THE FLU CASE

Doctors in the Ukraine accuse President of Genocide

The Flu Case, 23 November 2009, 09:52
https://web.archive.org/web/20100102010207/http://theflucase.com/index.php?option=com_content&view=article&id=2021%3Adoctors-in-the-ukraine-accuse-president-of-genocide&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Doctors in the Ukraine have accused the President, Viktor Yushchenko, and his agents of committing genocide in a letter published on the Ukrainian website Rupor Info, sparking fears that the reports of the deaths of thousands of people from artificially created pandemics and vaccinations are true.

The doctors accused the Yuschchenko of deliberately creating "epidemics" in specific regions for political reasons.

By the ploy of pandemics, the doctors say Yushchenko was able to postpone elections he would have almost certainly lost, declare martial law and remain in power as president.

The doctors who signed the letter have been forced to withdraw it.

The letter has ignited fears that many more people have died inside the quarantine zones set up in the Ukraine than the government-controlled media is reporting.

Sources in Poland are reporting that many people who are sick in the Ukraine received vaccinations.

One source reported that 99% of the people who came down with an unusually severe sickness were vaccinated.

After a vaccination with what appears to be the seasonal flu with an HIN1 virus, they became sick in 2 to 3 weeks and infected their family.

According to sources, 200,000 people in the Ukraine got a flu shot, resulting in an epidemic of sickness.

An especially severe flu gripping Poland also appears to be associated with the seasonal flu jab, with an H1N1 virus, according to the package.

Last week a woman reported thousands of people had been killed by vaccines inside closed-off quarantine zones inside western Ukraine.

GOVERNMENT OF THE CZECH REPUBLIC

Government Holds Extraordinary Meeting on Swine Flu and the EU Summit

Vlada.Gov, 23 November 2009, 10:16
https://vlada.gov.cz/en/media-centrum/aktualne/government-holds-extraordinary-meeting-on-swine-flu-and-the-eu-summit-64591/

Government discussed its approach to vaccination against swine flu and the mandate of the Czech delegation at today's European Union summit a.

The government discussed its approach to vaccination against swine flu and the mandate of the Czech delegation's at today's European Union summit at its extraordinary meeting today

At today's extraordinary meeting, Health Minister Dana Jurásková made public how the Czech Republic will proceed with vaccination against the flu caused by the Pandemic (H1N1) virus.

Vaccines for 95,000 people arrived in the Czech Republic on Tuesday. In coming days they will be delivered to general practitioners and vaccination centers. There will be eventually be pandemic vaccine for up to a million inhabitants; instead of the originally-planned two doses; according to the European Agency for Medicines, one dose is sufficient for most people. The state security council and then the government approved the change in the pandemic plan today. Only certain chronically ill patients will receive two doses. Antivirals have been prepared for an additional 2.5 million people. Other flu complications, most commonly bacterial pneumonia, will be treated with antibiotics.

Around 5,500 general practitioners will receive 45,000 to 50,000 doses of pandemic vaccine by the end of this week. According to the health minister, the vaccines have already been distributed. Vaccination will begin next week on the basis of a list which general practitioners will receive from health insurers.

Chronically ill patients at increased risk of infection will be vaccinated first, followed by doctors, nurses and health care workers at infectious disease clinics, and then people necessary to ensure the operation of the state – firemen, police, members of crisis task forces, people providing transportation, energy, water management and employees of regional government management bodies. Their turn will come in December. “We have expanded the diagnostic groups and for certain diseases we have refined the criteria for vaccination; not only persons with heavy forms of illness, but also middle forms of illness,” Minister Jurásková said. The strategy may still develop, especially for children's illnesses. It is the age group from 16 to 24 that is most afflicted, according to Czech Republic Chief Hygienist Michael Vít.

“No drama, no crisis will take place in the Czech Republic. The virus is readable. It is behaving the same consistently. The clinical course is easy for the vast majority of patients,” Minister Dana Jurásková said at a press conference. According to Czech Republic Chief Hygienist Michael Vít, the illness level will reach 1,520 ill per 100,000 inhabitants. No region of the Czech Republic has thus far reached the epidemic threshold of 2,000 ill per 100,000 inhabitants. Vít further said that the Karlovy Vary, Hradec Králove and Moravia-Silesia regions have the greatest incidence of illness. The number of sick in the Czech Republic who have actually had the H1N1 virus confirmed is approximately 500.

A meeting will take place today between Health Minister Dana Jurásková, the flu team and regional government representatives. The meeting will relate to approaches to vaccination in individual regions.

The cabinet today also discussed the mandate of the Czech delegation at the European Union summit in Brussels. The summit, called by the Swedish presidency, takes place on the occasion of the ratification of the Lisbon Treaty, which will come into effect as of 1 December of this year. The summit should decide on the persons for the "European president" and "foreign minister," functions which are introduced by the Lisbon Treaty. At a meeting of EU foreign ministers which took place on Monday, the Swedish presidency stated that the EU had more and more candidates for these positions.

There has been speculation about Netherlands Prime Minister Jan Peter Balkenende, former British Prime Minister Tony Blair, current Luxembourg Prime Minister Jean-Claude Junker and Belgian Prime Minister Herman Van Rompuy, and the name of former Latvian President Vaira Vike-Freiberg has also come up in connection with the chair of the Council of the EU or the "president," who would lead top EU meetings. A Czech candidate for the position will be decided on the spot.

iDNES.cz / ZPRAVODAJSTVÍ

Očkování proti prasečí chřipce začíná, lékaři se bojí žalob

iDNES.cz, 23 listopadu 2009, 11:30
http://zpravy.idnes.cz/ockovani-proti-praseci-chripce-zacina-lekari-se-boji-zalob-pnj-/domaci.asp?c=A091123_113019_domaci_ban

První lékaři dnes začali očkovat proti prasečí chřipce. Obávají se ale toho, že by mohli mít problémy kvůli pacientům, u nichž by tato vakcína vyvolala nežádoucí účinky. Česká lékařská komora jim proto radí nechat pacienty před očkováním podepsat informovaný souhlas.

Česká lékařská komora (ČLK) považuje za nestandardní, že výrobce není odpovědný za případné nežádoucí účinky. Zodpovědnost na sebe převzal stát. "To je to samé, jako kdyby prodejce aut v momentě, kdy by jeho auto přestalo brzdit a někdo se v něm zabil, řekl, že za to nemůže," je přesvědčen prezident Milan Kubek.

Podobně to vnímají i lékaři. "Bojíme se žalob. Firma nenese zodpovědnost za nežádoucí účinky, kdo ji tedy má nést?" ptá se pražská lékařka Jana Bendová.

Komora kvůli takovým obavám doporučuje lékařům a zdravotnickým zařízením, aby si od pacientů, kterým bude aplikována očkovací látka, nechali podepsat informovaný souhlas. "To je naprosto standardní postup, zdravotnické zařízení má podle zákona právo rozhodnout, u jakých výkonů bude tento souhlas požadovat," konstatoval Kubek.

"Je to ochrana pro obě strany. Pacient má jistotu, že bude informován o rizicích dané léčby, zdravotnické zařízení má doklad, že pacient byl poučen o rizicích a souhlasí s nimi," popsal prezident komory s tím, že "vágně formulované záruky ministerstva zdravotnictví právníky ČLK nepřesvědčily".

Vzorové formuláře informovaného souhlasu jsou podle Kubka na internetových stránkách ČLK.

Jako první na řadu přijdou zdravotníci

Distribuční společnost Pharmos začala vakcíny rozvážet zkušebně ve čtvrtek odpoledne. "Distribuce se rozběhla v pátek. Lékaři ale ordinují zpravidla jen dopoledne, uspěli jsme tedy u méně než poloviny z 600 navštívených ordinací," popsal iDNES.cz Jiří Sova z distribuční společnosti Pharmos.

"Dneska jsou od rána zavážena všechna vakcinační centra, kterých je zhruba 130, zpravidla jsou umístěna u nemocnic. Průběžně jsou zaváženi také praktičtí lékaři pro dospělé, přednostně na poliklinikách nebo ve zdravotnických zařízení, kde je jich víc pohromadě," informoval Sova.

Podle něj je tak možné dnes zahájit očkování ve vakcinačních centrech, kde se budou očkovat zdravotníci a lidé důležití pro zajištění chodu státu. Očkovat zdravotníky už začali například v olomoucké fakultní nemocnici.

V Praze je vakcinačních center šest - v každé fakultní nemocnici, jedno je v Městské poliklinice ve Spálené ulici. Jedno z center je v motolské fakultní nemocnici, kde bude očkováno na tři tisíce zdravotníků. Třetina z nich dostane vakcínu už v první fázi, která odstartuje zítra. Nemocnice už vakcíny dostala, informovala mluvčí Eva Jurinová.

U praktických lékařů je situace o něco složitější kvůli tomu, že si musí vybrané pacienty pozvat. Musí jich mít navíc najednou deset, protože vakcína se dodává v balení po deseti a po rozbalení se musí spotřebovat. I tak se ale zřejmě bude muset část vakcíny vylít. - Některé z vakcín proti prasečí chřipce se možná budou muset "vylít"

THE FLU CASE

Czech doctors worry about legal action against them over Swine Flu jab

The Flu Case, 24 November 2009, 14:41
https://web.archive.org/web/20100102030818/http://theflucase.com/index.php?option=com_content&view=article&id=2045%3Aczech-doctors-worry-about-legal-action-against-them-over-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Doctors in the Czech Republic have expressed fears that they will be made legally responsible in the event that patients suffer serious side effects from the swine flu jab after pharmaceutical companies have been given immunity, according to a report in the Czech media.
http://zpravy.idnes.cz/ockovani-proti-praseci-chripce-zacina-lekari-se-boji-zalob-pnj-/domaci.asp?c=A091123_113019_domaci_ban

"It is the same as if a car producer would claim he is not responsible in case there has been a brake failure causing the death of somebody," Milan Kubek, head doctor is reported to have said.

"We are afraid of legal proceedings. The producer holds no responsibility in case of side effects, who is supposed to hold it then?" Jana Bendová, a doctor from Prague said.

A key doctor's association has said patients should be made to sign a content.
"It is a way to protect both sides. The patient is informed about the risks of the treatment and the medical office has a proof that patients have been instructed about the risks and the have agreed to them," the head of the Chamber described and added that: "those vague guarantees given by Ministry of Health have not satisfied our lawyers."

However, the consent form might also be open to a legal challenge in court for not giving adequate information, according to Swiss vaccine experts.

This is a translation of the report:
The swine flu vaccination starts, but doctors are afraid of possible legal proceedings.

The first doctors have started to implement vaccinations against the swine flu. However they are afraid that they could face problems because of patients who might be affected adversely. The Czech Chamber of Doctors advices them to ask the patients to sign a content before being vaccinated.

The Czech Chamber of Doctors (Česká lékařská komora - ČLK) has noted that it is a non-standard that a producer is not made responsible for the possible side effects of their products. The responsibility rests with the state instead in the case of the swine flu jab.

"It is the same as if a car producer would claim he is not responsible in case there has been a brake failure causing the death of somebody," said Milan Kubek, the assocation's head.

Doctors share much of this view.
"We are afraid of legal proceedings. The producer holds no responsibility in case of side effects, who is supposed to hold it then?" Jana Bendová, a doctor from Prague asks.

The chamber is trying to prevent from such fears and recommends the doctors and medical offices to make their patients sign a content.

"This is a standard procedure; the medical office can decide by law where such a content will be required," Kubek stated.

"It is a way to protect both sides. The patient is informed about the risks of the treatment and the medical office has a proof that patients have been instructed about the risks and the have agreed to them," the head of the Chamber described and added that: "those vague guarantees given by Ministry of Health have not satisfied our lawyers."

A sample document of such content can be found on the website of the Czech Chamber of Doctors.

The health workers are first to go

The first distribution of vaccines started on Thursday afternoon by a company Pharmos.

"The distribution has started on Friday. However the doctors usually operate only in the mornings and that is why we reached less than half of the total from 600 offices," Jiří Sova from Pharmos described.

"Today (Monday 23 Nov) we have started to provide the vaccines to the vaccination centres (130 in total) which are mostly located close to hospitals. At the same time we have been supplying the doctors for adults – preferable those locations with a higher number of them," Sova informed.

He thinks that vaccination can be started today (Monday 23 Nov) in the vaccination centres where health workers and people important to the function of the country will be vaccinated. The hospital in Olomouc have for example already started to vaccinate their health workers.

There are six vaccination centres in Prague (the capital) – one in every teaching hospital and one is in Spálená street in the city centre. One of them is located in the teaching hospital in Motol where approximately 3 000 health workers will be vaccinated. One third of them will be given the vaccine in the first period which is supposed to start tomorrow.

We have already been supplied with the vaccines, the hospital spokesman Eva Jurinová confirmed.

The situation with doctors is a little bit more complicated. They have to ask their patients to come for the jab first. In addtion, there has to be ten of them at the same time because the vaccine is supplied in a package of ten pieces and it has to be used after being unpacked. It seems that some of them cannot be used and will have to be dispensed with.

Delivery of vaccines

The first part of vaccines (95 000 doses) have reached the Czech Republic. More should be provided (minimum 90 000) after 4 December and the rest should be provided in the first months of the following year by GSK, as the Minister of Health confirmed.

Leading hygienist Michal Vít refuses reservations that the pandemic wave could be over at this time and therefore the vaccination will be useless.

"There are usually several waves of a pandemics, the last one had three which lasted approximately within one year. I do not think that we will be late," he stated.

NOVARTIS

Novartis inaugurates large-scale US based cell-culture influenza vaccine manufacturing facility

Novartis, Basel, 24 November 2009

https://www.sec.gov/Archives/edgar/data/1114448/000110465909066665/a09-34221_16k.htm

· *Total investment of nearly USD 1 billion through a partnership between Novartis and the US Department of Health and Human Services*

· *Inauguration marks important milestone in using modern biotechnologies for flu vaccine production to replace the 50 year-old egg-based process*

· *Facility designed to supply 150 million doses of pandemic vaccine within 6 months of influenza pandemic declaration; facility ready to respond to a pandemic as early as 2011 if licensed in an emergency*

Basel, November 24, 2009 - Today, Novartis officially inaugurated the US's first ever large-scale flu cell culture vaccine and adjuvant manufacturing facility in Holly Springs, North Carolina. The facility is a result of a partnership between Novartis and the US Department of Health and Human Services (HHS). It is the first of its kind in the United States and highlights an important milestone in efforts to improve influenza vaccine manufacturing technology in the US and enhance domestic pandemic preparedness.

"We are proud to be one of the first companies to bring influenza cell culture as well as adjuvant technology to the United States," said Daniel Vasella, CEO and Chairman of Novartis. "We have seen a great need to invest into new technologies for flu vaccines that will allow for quicker and more reliable production capacity. We are pleased to be working closely with the US government to build a world-class, state of the art manufacturing facility in the US that will change the way we manufacture influenza vaccines in the future."

The total investment in the facility is nearly USD 1 billion, through a partnership between Novartis and HHS to support the design, construction, validation and licensing of the manufacturing facility in Holly Springs.

The operations at this facility will use modern, cell culture-based manufacturing technology. Cell culture-based production operations are cleaner, can be scaled up more quickly to respond to a pandemic and do not rely on eggs for rapid response to a pandemic. Cell culture technology for influenza vaccines is not yet approved in the US, however part of the HHS contract support for Holly Springs includes funding for the development of a flu cell culture vaccine. If licensed in an emergency, the facility will be ready to respond to a pandemic as early as 2011. The plant is planned to be running at full scale commercial production in 2013.

Novartis already operates a cell culture-based manufacturing plant in Marburg, Germany. It is licensed to produce a seasonal cell culture-based influenza vaccine, Optaflu®, which is approved in all 27 member states of the European Union as well as in Iceland and Norway. It currently produces Celtura®, a H1N1 pandemic vaccine licensed in Germany and Switzerland.

The Novartis Holly Springs facility can also start producing MF59®, the Novartis proprietary adjuvant, as early as December 2009. Although not yet approved in the US, studies with adjuvants are currently underway in the US. Results of the most recent clinical trials conducted with the Novartis MF59 adjuvanted cell culture-based vaccine have shown that it is possible to induce protective antibody levels against A(H1N1) infection within two weeks of administration of a single low-dose adjuvanted vaccine. MF59 has also been shown to provide cross-protection across similar strains of a H5N1 virus, which is an additional important element for a pre-pandemic vaccine given that mutations are a common feature of emerging influenza strains.

As part of its partnership with HHS, Novartis is responsible for, among other things, pre-construction document development, land use and zoning, construction, commissioning, validation and licensing of the facilities with the goals of regulatory licensure, manufacture and release of seasonal and pre-pandemic vaccine, as well as provision for pandemic vaccine supply in the event of a pandemic or other vaccines or biologicals in the event of an emergency for an emerging infectious disease. The partnership also requires Novartis to provide two commercial-scale annual lots of pre-pandemic vaccine for a minimum of three years. In addition, HHS has the right to exercise options to purchase additional influenza vaccine over 17 years.

About MF59®

Novartis proprietary MF59 adjuvant has an established safety profile, supported by more than 12 years of clinical safety data and more than 45 million doses of commercial use in Europe. The adjuvant has been studied in clinical trials involving more than 33,000 people, including children, and has been licensed for use in people 65 years of age and over in the seasonal influenza vaccine Fluad® since 1997 in the European Union. Novartis also produces two A(H1N1) vaccines, Focetria® and Celtura, which contain MF59 and are available outside the US. Currently, there are no approved vaccines in the United States that contain MF59.

Disclaimer

The foregoing release contains forward-looking statements that can be identified by terminology such as "as early as," "will," "future," "planned," "can," or similar expressions, or by express or implied discussions regarding the potential completion of the production facility at Holly Springs, the timing of potential commencement of and continued successful production of vaccines and adjuvants at Holly Springs, regarding the potential marketing approval cell-culture influenza vaccines, regarding the amounts to be paid by the government under the agreement described in this release, or regarding potential future revenues from vaccines produced at Holly Springs. You should not place undue reliance on these statements.

Such forward-looking statements reflect the current views of the Company regarding future events, and involve known and unknown risks, uncertainties and other factors that may cause actual results at the Holly Springs facility to be materially different from any future results, performance or achievements expressed or implied by such statements. There can be no guarantee that we will complete the Holly Springs facility, commence production there, or successfully continue production of vaccines there. Nor can there be any guarantee that any of the products expected to be produced at the Holly Springs facility will be approved for sale in any market. Neither can there be any guarantee that we will be paid the full amount referred to in this release. Neither can there be any guarantee that vaccines and adjuvants to be produced at Holly Springs will achieve any particular levels of revenue in the future.

In particular, management's expectations regarding the Holly Springs production facility and vaccines produced there could be affected by, among other things, unexpected regulatory actions or delays or government regulation generally; unexpected construction difficulties or delays; unexpected production difficulties or delays, including difficulties or delays relating to the novel cell-culture production technique to be employed there; unexpected clinical trial results, including unexpected new clinical data and unexpected additional analysis of existing clinical data; the company's ability to

obtain or maintain patent or other proprietary intellectual property protection; competition in general; government, industry and general public pricing pressures; the impact that the foregoing factors could have on the values attributed to the Novartis Group's assets and liabilities as recorded in the Group's consolidated balance sheet, and other risks and factors referred to in Novartis AG's current Form 20-F on file with the US Securities and Exchange Commission. Should one or more of these risks or uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary materially from those anticipated, believed, estimated or expected. About Novartis

Novartis Vaccines and Diagnostics is a division of Novartis focused on the development of preventive treatments. The division has two businesses: Novartis Vaccines and Chiron. Novartis Vaccines is the world's fifth-largest vaccines manufacturer and second-largest supplier of flu vaccines in the US. The division's products also include meningococcal, pediatric and travel vaccines. Chiron, the blood testing and molecular diagnostics business, is dedicated to preventing the spread of infectious diseases through the development of novel blood-screening tools that protect the world's blood supply.

Novartis provides healthcare solutions that address the evolving needs of patients and societies. Focused solely on healthcare, Novartis offers a diversified portfolio to best meet these needs: innovative medicines, cost-saving generic pharmaceuticals, preventive vaccines, diagnostic tools and consumer health products. Novartis is the only company with leading positions in each of these areas. In 2008, the Group's continuing operations achieved net sales of USD 41.5 billion and net income of USD 8.2 billion. Approximately USD 7.2 billion was invested in R&D activities throughout the Group. Headquartered in Basel, Switzerland, Novartis Group companies employ approximately 99,000 full-time-equivalent associates and operate in more than 140 countries around the world. Les réquisitions en passe de se multiplier

Le Quotidien du Médecin, 24 Novembre 2009
https://gynecologie-obstetrique.lequotidiendumedecin.fr/liberal/exercice/les-requisitions-en-passe-de-se-multiplier

Les Grandes Manœuvres pour conjurer la réquisition («le Quotidien» du 5 octobre) n'ont pas abouti. La dynamique de la vaccination, saluée la semaine dernière par Roselyne Bachelot, a eu raison des promesses officielles. Bien que «dernière des dernières des solutions envisagées», selon la formule du Pr Didier Houssin, la réquisition des libéraux, limitée jusqu'à présent au seul département du Calvados, pourrait se propager dans les prochains jours à plusieurs DDASS. Selon l'enquête effectuée par «le Quotidien», c'est le département des Hauts-de-Seine qui va suivre. «Le compte est vite fait, explique un médecin de l'organisme, responsable du dispositif antipandémie 92, sur 4 500 libéraux, nous n'avons reçu que 170 candidatures de volontaires disposés à s'engager dans nos centres. Cet effectif est d'autant plus insuffisant que le nombre des candidats à la vaccination a doublé en quelques jours. Dans ces conditions, la mobilisation autoritaire des médecins constitue une nécessité de santé publique en contexte de crise sanitaire, et répond aux exigences déontologiques qui doivent être celles de tout praticien.»

Les circulaires ministérielles du 21 août et du 28 octobre avaient pourtant classé les libéraux en dernière position pour les ordres de réquisition, après les salariés, les étudiants et les internes. Mais les fichiers les concernant n'ont, semble-t-il, pas été transmis aux DDASS. La direction régionale du travail n'a pas communiqué les listes de médecins du travail et les doyens des facultés n'ont pas fourni les listes de leurs étudiants de 3e et 4e années. Les réquisitions vont donc être adressées dès cette semaine aux libéraux altéséquannais, sur la base, dans un premier temps, d'une vacation mensuelle. Les homéopathes, accupuncteurs et autres ostéopathes devraient être les premiers visés, 700 généralistes ayant été identifiés comme spécialement sollicités en période épidémique.

Selon le Dr Jean-Paul Hamon (FMF), «ça commence à réquisitionner un peu partout». Cependant, la démarche du 92 restait lundi soir exceptionnelle. La DDASS du 77, malgré le décuplement de la fréquentation enregistrée dans ses centres la semaine dernière, comptait encore faire face avec les médecins salariés et les internes. Celle du 95 considère qu' « on n'en est pas encore à réquisitionner les libéraux», tout en admettait qu'on n'en a jamais été aussi proche. Dans le 94, on se retranche derrière des décisions qui devront être prises collégialement, sous la responsabilité du préfet. Dans l'Orne, l'inspectrice principale de la DDASS avoue que la gestion des volontaires permettra encore de faire face cette semaine, mais qu'elle risque d'être insuffisante dès la semaine prochaine. Le plus souvent, comme à Paris, la consigne «silence radio» prévaut, pour ne pas faire mentir les protestations réitérées par les autorités de santé nationales, qui garantissent qu'il ne saurait être question de faire fermer un cabinet de généraliste, qui se trouve évidemment en première ligne dans le contexte épidémique.

«Déficit d'organisation»

Les réquisitions fermes semblent devoir se généraliser, malgré les dénégations officielles, pour ajuster le fonctionnement des centres à une demande croissante du public. Au Conseil national de l'Ordre des médecins, le Dr André Deseur, président de la section Exercice professionnel, estime que «les médecins n'ont d'autre choix que de s'y plier», mais il exprime son «immense regret qu'un

déficit d'organisation n'ait pas permis d'échapper à une telle mesure. Sortir de force des praticiens de leur activité de soins risque de susciter une bronca, avertit-il, en se faisant l'écho des réactions qui lui parviennent via les conseils départementaux. Une bronca que nous comprenons dans la mesure où il existait d'autres possibilités pour organiser la vaccination. L'Ordre aurait pu communiquer, si on lui en avait fait la demande, des fichiers de médecins du travail, si tant est que les directions régionales du travail n'ont pas pu procéder à leur extraction.»

Alors que le conflit semblait en voie d'apaisement par rapport à la vaccination en ville («le Quotidien» de lundi), il risque à présent d'être rallumé autour des réquisitions. «Il va y avoir du sport», promet le Dr Michel Chassang (CSMF), dénonçant «des mesures complètement incohérentes».

THE FLU CASE

French Government prepares to order GPs to work in Swine Flu jab centres

The Flu Case, 26 November 2009, 17:35

https://web.archive.org/web/20100102014903/http://theflucase.com/index.php?option=com_content&view=article&id=2082%3Afrench-government-prepares-to-order-gps-to-work-in-swine-flu-jab-centres&catid=1%3Alatest-news&Itemid=64&lang=en

The prefects of departments in France are preparing to order GPs and nurses to work in specially set up swine flu vaccine centers, according to a report Le Quotidien du Medecin.

Hauts-de-Seine is set to follow Calvados in ordering GPs to turn up for duty after only 170 doctors out of 4,500 in the department volunteered to work in the centers.

Doctors in Calvadao are currently challenging the order to work in the swine flu jab centers in court.

In Paris, 20 to 25% of the health care professionals summoned to come for their swine flu jabs by the Prefect Daniel Canepa didn't turn up.

Swine flu vaccine further delayed

Cayman News, 24 November 2009
http://archive.caymannewsservice.com/2009/11/24/swine-flu-vaccine-further-delayed/

(CNS): Cayman is unlikely to receive its first batch of Swine flu vaccine until the end of this year or possibly not until 2010. The UK has, according to government, agreed to send around 12,500 doses of the H1N1 shot, which should be enough to cover high risk local groups, but worldwide shortages are putting pressure on supplies and government is trying to secure other sources. The minister for health said he has also been talking with a manufacturer that could supply the vaccine directly to health officials in Cayman.

"My ministry will continue to support the Public Health Department in securing enough H1N1 vaccine for our population," Mark Scotland said. "To date, the H1N1 vaccine was not available on the open market and we focused our efforts on working with the UK and PAHO to secure the vaccine. However, we are also now working with a manufacturer that can supply vaccine directly to us. Even so, because demand is outstripping supply worldwide, here too supplies will only be available in the New Year."

The Public Health Department has requested an initial 12,500 H1N1 vaccine doses from the UK to cover most of the high-risk groups, Medical Officer of Health Dr Kiran Kumar said.

Meanwhile, Public Health has also been working closely with the **Pan American Health Organisation** (PAHO) to secure a second source of H1N1 vaccine. PAHO will be receiving its first supplies – a million doses – in the second week of December. The bulk of its supplies, some 33 million doses, will only arrive between February and April next year.

"These doses have to be divided amongst all Caribbean and Latin America countries and will be allocated according to population size. Therefore, we cannot be sure how many doses we will receive in each instalment," Dr Kumar explained.

To date, Cayman has registered a total of 109 confirmed H1N1 cases – four of these were confirmed during the past two weeks.

While the public awaits the H1N1 vaccine's arrival, Dr Kumar continues to urge proactive measures. "Staying home when you are sick, keeping sick children out of school and frequent hand washing remain the best defences," he said. The Health Services Authority has set-up a dedicated Flu Clinic where people with severe flu symptoms can be treated as a priority and segregated from other patients to prevent the spread.

Meanwhile, doctors in Canada are being advised not to use 170,000 doses of the vaccine manufactured by pharmaceutical company GlaxoSmithKline following a number of allergic reactions to the drug. Company spokeswoman Gwenan White said that GlaxoSmithKline has advised medical staff in Canada to refrain from using one batch of the vaccine while they look into reports that that it might have caused more allergic reactions than normal.

Six people in Canada had suffered an allergic reaction and GlaxoSmithKline is only investigating the one batch, as it said no other doses around the world are affected.

Yesterday, the **World Health Organisation** reported that 65 million people have been vaccinated to date worldwide and there have been 10 known cases of Guillain-Barre syndrome, an auto-immune based paralyzing condition often seen following viral infection.

The agency said the side-effects of the H1N1 shot have been typical of flu vaccines: "As anticipated, side effects commonly reported include swelling, redness, or pain at the injection site, which usually resolves spontaneously a short time after vaccination. Fever, headache, fatigue, and muscle aches, occurring shortly after vaccine administration,have also been reported, though with less frequency. These symptoms also resolve spontaneously, usually within 48 hours. In addition, a variety of allergic reactions has been observed. The frequency of these reactions is well within the expected range." WHO said.

Health officials in Norway have reported three cases of H1N1 swine flu that have a mutation which enables the virus to attack the deep lungs. Whether this means the virus is or could become more dangerous is unclear. "This mutation has been seen sporadically here and there around the world. Sometimes it's been seen in patients who had very mild disease and sometimes it's been seen in people who had more severe or fatal disease," said Dr Anne Schuchat, the director of the CDC's National Center for Immunization and Respiratory Diseases.

Le Monde

Grippe A: 305 000 personnes ont été vaccinées

Le Monder avec AFP, 24 Novembre 2009, 20h29
https://web.archive.org/web/20091126045801/http://www.lemonde.fr/planete/article/2009/11/24/grippe-a-305-000-personnes-ont-ete-vaccinees_1271592_3244.html#ens_id=1185166

Le ministère de l'intérieur a confirmé mardi 24 novembre une progression de la fréquentation des centres de vaccination contre la grippe H1N1, avec 305 000 personnes vaccinées au soir du 21 novembre, soit huit jours après le lancement de la campagne.

"Actuellement, 65 000 personnes fréquentent chaque jour un centre, contre 13 000 à son lancement", précise le ministère dans un communiqué. La ministre de la santé Roselyne Bachelot avait annoncé le 18 novembre que la campagne était *"en pleine accélération"*, avec *"plus de 200 000 personnes"* vaccinées. La campagne a débuté le 12 novembre dans 1 060 centres, sous la responsabilité des préfets.

A partir du 25 novembre, les centres de vaccination utiliseront *"leurs équipes mobiles au sein des collèges et des lycées pour commencer la campagne de vaccination dans ces établissements"*.

Grippe A: horaires adaptés dans les centres et bons de vaccination obligatoires

Le Monde, avec AFP, 24 Novembre 2009, 10h32
[https://eoigijon.com/wp-content/uploads/2016/12/Jun-NI-CL-1-y-2.pdf]

La campagne de vaccination contre la grippe H1N1, fondée sur le volontariat, débute en novembre dans les collèges et lycées pour les 5,3 millions d'élèves du secondaire. Les parents de collégiens et lycéens mineurs ont reçu un "questionnaire préalable à la vaccination" en trois parties: précisions sur la santé de l'adolescent et les éventuelles incompatibilités vis-à-vis du vaccin; accord parental donné ou non à la vaccination; observations faites par le médecin, notamment le nom du vaccin prescrit. Le carnet de santé n'est pas nécessaire. Si la responsabilité de la vaccination incombe aux parents, en revanche ils ne peuvent pas choisir le vaccin. Quant aux écoliers du primaire, ceux-ci pourront se rendre, avec leurs parents, dans les centres de vaccination de proximité. [https://eoigijon.com/wp-content/uploads/2016/12/Jun-NI-CL-1-y-2.pdf]

Désertés dans un premier temps mais connaissant une affluence croissante, les centres de vaccination vont voir, si besoin, leurs horaires "adaptés". Le ministre de l'éducation nationale, Luc Chatel, a annoncé mardi sur RTL que pour faire face à l'afflux actuel, "les préfets vont adapter les heures d'ouverture des centres". Ces centres sont prévus pour la vaccination du grand public, mais ils accueilleront aussi à partir de début décembre les enfants du primaire dont les parents souhaitent qu'ils soient vaccinés. Pour les élèves de collèges et lycées, la procédure est différente: si leurs parents ont donné leur accord, ces adolescents se feront vacciner au sein de leurs établissements scolaires, et ce à partir de mercredi.

En réponse aux auditeurs de RTL, M. Chatel a cependant bien précisé que, si la vaccination des collégiens et lycéens commençait mercredi, elle devait s'étendre au moins jusqu'au 18 décembre et donc qu'elle ne serait pas organisée dans tous les établissements dès cette fin de semaine. La vaccination n'est pas obligatoire, mais le ministre l'a "recommandée" à la population en général et aux enseignants en particulier. M. Chatel a affirmé que lui-même allait "le faire dans les prochains jours".

Ne pas se Présenter sans bon de la "sécu"

De son côté, la ministre de la santé, Roselyne Bachelot, a demandé mardi aux Français de ne pas se rendre dans les centres de vaccination contre la grippe H1N1 sans un bon de convocation, reconnaissant des problèmes de "réglages" ces derniers jours en raison d'une plus grande affluence. "Nous avons multiplié par sept la fréquentation des centres en moins d'une semaine", a souligné la ministre sur France Info, citant le chiffre de 70 000 personnes vaccinées pour la journée de samedi.

"Il y a besoin de réglages parce que nous n'attendions pas, c'est vrai, un tel engouement des Français pour la vaccination", a reconnu Mme Bachelot. "Bien entendu, on va augmenter les personnels, on va augmenter les horaires d'ouverture", a-t-elle ajouté. "Ne vous présentez pas dans les centres de vaccination si vous n'avez pas votre bon de Sécurité sociale", a demandé Mme Bachelot aux Français, ajoutant qu'elle allait "redonner les consignes".

La ministre a également conseillé de consulter les horaires de vaccination des centres "sur Internet, dans les mairies ou dans les pharmacies". Selon Mme Bachelot, les horaires sont disponibles sur Internet, en tapant le nom du département, suivi de "pref.gouv.fr". Elle a cité l'exemple de Paris: paris.pref.gouv.fr. Mais lorsqu'on essayait de consulter cette page mardi matin, la réponse obtenue était "site en construction". Interrogée sur un problème d'approvisionnement de Tamiflu pédiatrique en pharmacie, Mme Bachelot a répondu: "On a des stocks qui nous permettront de reconstituer cela." Elle a invité les médecins à se référer aux protocoles d'administration de cet antiviral.

French told not to bother showing up for Swine Flu jab without their special coupon

The Flu Case, 24 November 2009, 14:47

https://web.archive.org/web/20100102032444/http://theflucase.com/index.php?option=com_content&view=article&id=2047%3Afrench-told-not-to-bother-showing-up-for-swine-flu-jab-without-their-special-coupon&catid=1%3Alatest-news&Itemid=64&lang=en

The French are being told not to bother showing up at the swine flu vaccine centers unless they have coupon, sent to each person individually, according to Le Monde.

The individually-tailored vaccine coupon -- based on employment and social security data – will determine which swine flu jab what person in France gets...

In addition, the special code on each individual needle used for a swine flu jab will be attached to each patient's form.

Swiss soldier reports preparations for forced Swine Flu vaccination campaign underway

The Flu Case, 24 November 2009 20:39
https://web.archive.org/web/20100102054140/http://theflucase.com/index.php?option=com_content&view=article&id=2049%3Aswiss-soldier-reports-preaparations-for-forced-swine-flu-vaccination-campaign-underway&catid=41%3Ahighlighted-news&Itemid=105&lang=en

> Kaserne Bremgarten AG: Eidgenössischer Waffenplatz Bremgarten (Kaserne)
> Seit 1952 wurde in Bremgarten ein Detachement der
> Genie-Rekrutenschule Brugg untergebracht.
> ...
> Heute dient die Kaserne der Genieschule 74 und dem
> Einsatzkommando Katastrophenhilfe-Bereitschaftsverband,
> Ei Kdo Kata Hi Ber Vb als Standort.
> Die Ausbildung erfolgt auf den verschiedenen dezentralen Ausbildungsplätzen.
> https://web.archive.org/web/20091127155636/http://www.kaserne-bremgarten.ch/kaserne/ueberuns.html

Da ich momentan im Militär tätig bin, hab ich mich mal bei der Krankenabteilung auf dem Waffenplatz Bremgarten AG erkundigt, wo es zur Abwechslung gute Ärzte hat, welche nicht einfach mal in jedem Fall Schmerzmittel verschreiben. :)

Auch im Militär ist die Sau los wegen der Soiligripp. Diesen Freitag gehen alle mit Ihrem Impfausweis vorbei und können sich impfen lassen.

Nun hab ich den Chefarzt mal auf die Nadeln angesprochen. Es ist definitiv so, dass für jeden Impfling eine ganz neue, spezielle Nadel bereit steht, welche einen Strichcode enthält.

Dieser Strichcode wird für den jeweiligen Impfling registriert und schlussendlich ans BAG geschickt. Warum und wieso eine neue, spezielle Nadel benötigt wird, weiss er nicht. Ich werde sie mir diesen Freitag aber selbstverständlich genau unter die Lupe nehmen. :)

Weitere Angehörige der Armee müssen sich in Acht nehmen:

Bei den Sanitätstruppen rüstet man sich für den "Ernsteinsatz". Alle Soldaten der San Trp müssen/mussten sich vorbereiten um in einem Ernstfall auszurücken und alle Ada's zu impfen. Und dies selbstverständlich nicht auf freiweilliger Basis. Also ist diese Aktion mehr oder weniger absehbar. Soweit meine Information.

THE FLU CASE

Swiss soldier reports preparations for forced Swine Flu vaccination campaign underway

The Flu Case, 24 November 2009 20:39

https://web.archive.org/web/20100102054140/http://theflucase.com/index.php?option=com_content&view=article&id=2049%3Aswiss-soldier-reports-preaparations-for-forced-swine-flu-vaccination-campaign-underway&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A Swiss soldier serving in Bremgarten, Aargau, where military units for disaster management are stationed, has said that medical units are preparing to carry out an operation to give all Swiss soldiers the swine flu jab by force if necessary. http://www.kaserne-bremgarten.ch/kaserne/ueberuns.html

The soldier said that a doctor at the base also explained that every swine flu jab has a special needle with a bar code.

The bar code is registered for every person who takes the jab and then sent to the Federal Ministry for Health, the Bundesamt für Gesundheit.

The military doctor said he didn’t know why a special needle was needed but there are many reports of a nanochip in the needle.

The soldier said that the medical troops are preparing for a "serious scenario.”

Every soldier belonging to the medical unit has to prepare to vaccinate every other soldier whether they want to be vaccinated or not in a "worst case scenario".

He said he considered forced vaccination to be inevitable.

The soldier’s supports an earlier report that Swiss soldiers belonging to medical units are being called up and trained for a mass forced vaccination campaign.

Eric Favereau

H1N1: le cortège d'erreurs des bulletins secrets

Liberation, 25 novembre 2009
https://web.archive.org/web/20091219171937/http://www.liberation.fr/societe/0101608790-h1n1-le-cortege-d-erreurs-des-bulletins-secrets

«Libération» *s'est procuré les rapports confidentiels de la cellule interministérielle de crise.*

C'est le rendez-vous quotidien au sommet sur la grippe A: tous les jours, la cellule interministérielle de crise réunit les responsables des ministères concernés, sous la responsabilité du directeur de la Sécurité civile. On fait le tour des difficultés. On tente d'y remédier.

Bizarrement, alors que la ministre de la Santé, Roselyne Bachelot, se dit partisane de la transparence la plus complète dans la gestion de l'épidémie, les bulletins quotidiens, qui ponctuent cette réunion, sont marqués du sceau *«Ultraconfidentiel».* Rien ne filtre. Secret défense. *Libération* a pu se procurer le compte rendu des dernières réunions, en particulier celle du dimanche 13 décembre. Voilà une journée presque ordinaire, avec ces mille et un petits soucis que connaît le plan de vaccination.

«Malaise vagal». Le rapport est classé par zones de défense. Ainsi, la zone sud-ouest: «Dans le Gers, erreur de vaccin pour deux personnes. Malaise vagal d'un enfant de 6 ans après vaccination de Panenza. Erreur de numéro de lot sur 7 bons de vaccination.» Dans les Pyrénées-Atlantiques, à Orthez, «malaise vagal chez une adolescente, passage aux urgences de l'hôpital d'Orthez et retour chez elle». En Charente-Maritime, à Surgères, «un enfant vacciné avec du Panenza au lieu de Pandemrix, un autre vacciné avec du Pandemrix au lieu de Panenza. Les deux enfants sont de la même famille: ils ont été mis sous surveillance parentale». A Royan, «malaise vagal d'un enfant de 10 ans ayant entraîné une chute avec léger choc sur la tête. Son état a justifié un transport par les pompiers au CH de Royan». A La Rochelle, c'est différent: «Difficulté en approvisionnement en gants et pansements sur certains centres.» De même en Corrèze: «Difficultés de recrutement de personnels médicaux et paramédicaux pour assurer les vacations».

Dans les Deux-Sèvres, «la livraison des produits reste aléatoire: retards systématiques, livraisons incomplètes ou ne correspondant pas aux commandes, en dehors des horaires d'ouverture des centres de vaccination». Dans le Tarn-et-Garonne, «un médecin et une élève infirmière réquisitionnés ne se sont pas présentés. Ces absences n'ont pas perturbé le bon fonctionnement du centre de vaccination».

Et ainsi, dans chaque zone de la France. On passe dans le nord. Dans l'Oise, «difficulté d'approvisionnement, des erreurs constatées par plusieurs centres dans la livraison des vaccins avec des étiquettes qui ne correspondent pas aux lots de vaccins livrés. Difficultés répétées d'obtention de certains consommables médicaux malgré commandes réitérées: rouleaux de papier pour table de consultation, pansements pour enfants, couvertures de survie, notices de vaccins Pandemrix».

Doute. Dans l'ouest de la France, dans le Finistère exactement, «des internes ne se sont pas rendus sur les lieux de vaccination et n'ont pas prévenu. Le département a dû faire face à de grosses difficultés pour trouver des volontaires le samedi après-midi. Une erreur d'injection, sans incidence particulière selon le médecin. Trois malaises vagaux survenus chez des enfants entre 7 et 10 ans». Dans l'Eure, «doute sur la vaccination d'une femme enceinte de huit mois avec du Pandemrix». En

Eure-et-Loir, «malaise de deux enfants; un personnel médical s'est piqué avec une seringue usagée. Seconde injection de Pandemrix sur un enfant de 10 ans», etc..

La note de synthèse quotidienne se conclut par le point sur les fermetures de classes. «Plusieurs établissements scolaires ont fait l'objet de mesures de fermeture, totale ou partielle, depuis le jour de la rentrée scolaire: 663 établissements, de la maternelle au lycée, ont été fermés intégralement. 513 fermetures de classes individuelles. À la date du 12 décembre 2009: 64 classes demeurent fermées, et 94 établissements demeurent totalement fermés». Ainsi va la France, un dimanche sous la grippe A.

THE FLU CASE

Secret Memo reveals France divided into Martial Law defence zones for Swine Flu Jab

The Flu Case, 22 December 2009 10:45
https://web.archive.org/web/20100102043916/http://theflucase.com/index.php?option=com_content&view=article&id=2384%3Asecret-memo-reveals-france-divided-into-martial-law-defence-zones-for-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Unreported by the French mainstream media, a special interdepartmental crisis committee which receives instructions from WHO has been operating in France since April under the pretext of managing the swine flu pandemic emergency.

This committee summons French Ministers to give them instructions on a day to day basis, and so bypasses parliament and other democratic institutions, creating a state of virtual martial law.

The French Health Minister Roseylne Bachelot recently floated the idea of moving the internal pandemic level from 6 b to 6 a, which would initiate fully fledged martial law.

Now the newspaper La Liberation maintains it has obtained an "ultra confidential" memo from a Sunday meeting of this secretive committee.

The memos details the progress and "errors" of the swine flu vaccination programme across the country, using the classification of "defence zones", underlining the military character of the swine flu programme.

Grippe A (H1N1): allergique à la désorganisation … s'abstenir

Journal International de Médecine, 25 Novembre 2009
https://www.jim.fr/e-docs/grippe_a_h1n1_allergique_a_la_desorganisation_s_abstenir__112572/document_actu_pro.phtml
(deleted)

Ainsi, à Caen, par deux fois, des médecins généralistes ont attaqué en référé les ordres de réquisition du préfet du Calvados et ont été deux fois (dont une fois hier) débouté de leur demande. A Pechbonnieu (Haute Garonne, moins de 3 000 âmes), les médecins ont décidé aujourd'hui de se rendre en délégation au centre de vaccination pour exiger qu'on leur remette des doses de vaccins et des formulaires pour pouvoir procéder eux-mêmes aux injections dans leur cabinet.

A Paris, le préfet, Daniel Canepa estimait hier que 20 à 25 % du personnel médical et administratif convoqué ne se présentent pas aux vaccinations. «Si on n'y arrive pas ici, c'est dramatique. Car à Paris, on ne peut pas dire qu'il y ait une pénurie de médecins» déplore-t-il. Il est à espérer que la situation s'améliore d'ici lundi, date à laquelle doit commencer l'immunisation des enfants des classes primaires, invités à se rendre avec leurs parents dans les centres de vaccination.

Dans la capitale, comme dans d'autres régions (notamment dans le Nord Pas de Calais), il est prévu d'immuniser également les parents: l'affluence devrait être accrue. L'engouement soudain des Français pour la vaccination n'a cependant pas permis à l'hexagone de rattraper son retard sur d'autres pays: au 21 novembre, le ministère de l'Intérieur comptabilisait 305 000 personnes vaccinées!

D'une manière générale, la mobilisation des professionnels de santé laisserait à désirer dans de nombreuses régions de France.

WHO donates 9 million flu shots to Philippines

Reuters, 26 November 2009, 5:25 PM GMT+8
https://www.reuters.com/article/us-flu-philippines-vaccines-idUKTRE5AP14020091126/

Manila, Nov 26 (Reuters) – The World Health Organisation (WHO) promised on Thursday to donate 9 million H1N1 flu shots to the Philippines, and assured the country the vaccines were safe.

At least 1.2 million of the vaccine shots will be made available by the end of the year and be distributed to about 400,000 health workers in the Philippines, WHO director-general Margaret Chan told reporters in Manila.

"The vaccine is safe," Chan said, adding the rate of side effects was within the expected range.

But she urged the Philippines to conduct post-vaccination surveillance to determine any potential harmful side effects.

Chan said the WHO has prioritised donating flu vaccines to 10 percent of the population of poor and developing countries from stockpiles from more developed states. The Philippines has about 92 million people.

Last week, the WHO said the H1N1 vaccine had been cleared of blame for 41 deaths which health authorities worldwide had investigated after suspicions were raised they might have been caused by the inoculation.

Governments have so far reported that 65 million vaccine doses have been administered against H1N1, known as swine flu, in 16 countries, but the true figure is probably higher since immunisation campaigns are under way in 40 states, said a WHO vaccine expert.

At least 6,770 deaths have been recorded worldwide since the H1N1 virus emerged in April – but officials always stress the confirmed count represents only a fraction of the actual cases as most patients never get tested.

In the Philippines, 33 deaths were recorded in nearly 5,500 cases from May to October this year.

The New York Times

Experts say Swine Flu mutations do not warrant new alarm

The New York Times, 27 November 2009
https://web.archive.org/web/20121115211101/http://www.nytimes.com/2009/11/28/health/28flu.html

The World Health Organization tried this week to dampen fears about mutations seen in the swine flu virus in several countries, noting that both mutations had been found in very few people.

A change that created Tamiflu resistance has been found in about 75 people around the world, said Dr. Keiji Fukuda, chief flu adviser to the W.H.O.'s director general. Two clusters, in cancer units at Duke University Medical Center in North Carolina and a hospital in Wales, were both among patients whose immune systems had been severely suppressed by cancer treatment; some had had their bone marrow, which produces infection-fighting white blood cells, wiped out so that replacement blood stem cells could be injected.

Such patients are more likely to develop resistant viruses when on Tamiflu because they can not clear a virus on their own. But the mutant strain appears not to spread easily in people with normal immunity, like hospital workers.

"We don't know the full answer, but it is more likely that we are not seeing a major shift," Dr. Fukuda said.

Widespread Tamiflu resistance is a serious problem in the seasonal H1N1 virus, but it has not crossed over into the swine H1N1.

Dr. Fukuda also said W.H.O. scientists were "not sure" of the level of threat posed by a separate mutation that helps the virus reach the lungs. It has been found in Norway, Ukraine, Brazil, China, Japan, Mexico and the United States, in both serious and mild cases.

Experts still need to see whether the mutation – whose shorthand name in virology is D222G or D225G – is becoming more common, and how often it leads to severe disease, he said.

One isolate from Ukraine with the mutation had changed so *that swine flu vaccine probably would not protect against it well*, Britain's national medical laboratory reported Friday.

Flus mutate so fast, Dr. Fukuda cautioned, that announcing each change is "like reporting changes in the weather."

More than 100 million swine flu shots have been administered in 40 countries, and the side effects are similar to or lower than those from regular flu shots, he added.

Six cases of anaphylaxis were widely reported in Canada when it was found that all were from one batch of vaccine, which was recalled. Anaphylaxis is an allergic reaction, usually to egg protein, that can range from mild hives to fatal airway swelling. All six patients recovered, and Dr. Fukuda pointed out that there were 172,000 doses in the batch, most of which caused no problems, so it was unclear whether the cause was a bad batch or just a coincidence.

MEDICÍNA .CZ

V České republice se začalo očkovat proti pandemické chřipce

Medicina.CZ, 27 listopad 2009
https://medicina.cz/clanky/8235/34/V-ceske-republice-se-zacalo-ockovat-proti-pandemicke-chripce/

Na začátku tohoto měsíce - listopad - byly v České republice naočkovány první vybrané skupiny osob proti pandemickému viru chřipky H1N1. V rámci první dodávky bylo do země doručeno celkem 95 tisíc dávek vakcíny Pandemrix™ společnosti GSK, kterou budou očkováni chronicky nemocní pacienti, zdravotníci a osoby nezbytné pro chod státu. Dle dostupných údajů z provedených klinických hodnocení v současnosti vyplývá, že by mohlo být dostačující očkování pouze jednou dávkou vakcíny. V České republice by tak pandemickou vakcínou mohl být očkován až jeden milion lidí.

Do České republiky dorazilo minulý týden celkem 95 tisíc dávek vakcíny Pandemrix™, která je určena k ochraně rizikových skupin proti pandemickému viru chřipky H1N1 (tzv. prasečí chřipce). Očkovány budou vybrané skupiny osob, mezi které patří zejména chronicky nemocní pacienti, zdravotníci a osoby nezbytné pro zajištění chodu státu.

Vakcína se vyrábí od 21. září letošního roku, a to v týdenních cyklech. Celková týdenní produkce je následně rozdělována mezi jednotlivé země. Tento princip je uplatňován pro všechny státy, které mají s GSK uzavřenou smlouvu na dodání pandemické vakcíny. Vydávání vyrobených vakcín v týdenních intervalech je shodné pro všechny země a počet odpovídá výrobě jednotlivých šarží.

O aktuální situaci vyrobeného množství vakcíny pro Českou republiku je Ministerstvo zdravotnictví ČR průběžně informováno.

Evropská léková agentura v minulém týdnu oznámila, že u dospělých zdravých osob by mohlo být dostačující očkování pouze jednou dávkou pandemické vakcíny. Dvěma dávkami by měli být očkováni pacienti se závažným chronickým onemocněním, dialyzovaní a pacienti po transplantaci. Na základě těchto změn by tak mohl být v České republice očkován pandemickou vakcínou téměř jeden milion obyvatel.

Očkování pandemickou vakcínou je určeno pouze pro rizikové osoby uvedené ve „Vakcinační strategii" Ministerstva zdravotnictví ČR a probíhá ve zdravotnických zařízeních určených jednotlivými kraji. Seznamy očkovacích míst lze nalézt na Pandemickém webovém portálu MZ ČR. Chronicky nemocní pacienti budou očkováni v ordinacích svých praktických lékařů, kteří je budou v průběhu následujících týdnů postupně zvát na očkování.

Nově byla také pro očkující lékaře zřízena informační linka 844 606 607 určená pro dotazy týkající se vakcíny Pandemrix™, a to zejména bezpečnosti, profilu nežádoucích účinků a podmínek skladování. Telefonní linka je v provozu každý všední den od 8 do 18 hodin a na dotazy odborníků zde odpovídají speciálně vyškolení pracovníci.

THE FLU CASE

UK Parliamentary Briefing Note from November 10th says Compulsory Vaccinations Allowed

The Flu Case, 27 November 2009, 12:37
https://web.archive.org/web/20100102003952/http://theflucase.com/index.php?option=com_content&view=article&id=2095%3Auk-parliamentary-briefing-note-from-november-10th-says-compulsory-vaccinations-allowed&catid=41%3Ahighlighted-news&Itemid=105&lang=en

UK Parliament

UK Parliament

A UK Parliamentary briefing note published on November 2009 maintains that the government has the power to impose compulsory swine flu vaccinations under the Civil Contingencies Act 2004

UK Parliament, November 2009
https://web.archive.org/web/20100423153715/http://www.parliament.uk/commons/lib/research/briefings/snsc-05164.pdf

Dr Gavin Colthart authored the "information is provided to Members of Parliament in support of their parliamentary duties."

The note also says that local authorities can declare people who are suspected of having the swine flu to be guilty of a criminal offence.

The note also makes the claim for which there is as yet no evidence that the swine flu can cause Guillain-Barré syndrome in an apparent attempt to downplay the cases of Guillain-Barré syndrome reported in connection with the swine flu jab in the US and France.

Extracts:
"**Powers to impose compulsory vaccination**
Most legal powers needed to manage a pandemic are provided under the Public Health Acts covering England, Wales, Scotland and Northern Ireland, which empower local authorities to require examination, hospitalisation, or isolation of infected persons, create a criminal offence relating to exposing others to risk of infection, and allow some controls over school attendance and playgrounds.14

In other words, although local authorities cannot force people to be vaccinated under those powers, they can for example refuse to admit children to school unless they have been vaccinated.

However, the Government has extremely broad powers for tackling an emergency, in the Civil Contingencies Act 2004. This includes a special procedure for making regulations in an emergency, if existing legislation could not relied upon without the risk of serious delay, and various other conditions are met.

In particular:

22 Scope of emergency regulations

(1) Emergency regulations may make any provision which the person making the regulations is satisfied is appropriate for the purpose of preventing, controlling or mitigating an aspect or effect of the emergency in respect of which the regulations are made.

(2) In particular, emergency regulations may make any provision which the person making the regulations is satisfied is appropriate for the purpose of –

(a) protecting human life, health or safety,

(b) treating human illness or injury,

Thus, if the situation became serious enough for compulsory vaccination to be considered necessary, regulations could be introduced under the Civil Contingencies Act 2004 and these could include penalties for non-compliance."

"Vaccine safety concerns

Anti-vaccine activists and others have opposed widespread use of any new vaccine, arguing that the accelerated clinical testing of the new vaccines makes it difficult to ensure safety and that the generally mild course of novel H1N1 flu infection does not justify exposing the population to vaccine-related risks.7

Particular concern has been raised regarding Guillain-Barré syndrome, a nerve disease causing reversible paralysis, which has been associated with flu vaccinations. A rise in cases of Guillain-Barré syndrome resulted in the cessation of a 1976 national flu vaccination programme in the USA. Analysis of the data from that time, and several subsequent studies, suggest that there is a small rise in the incidence of the syndrome (between 1:100,000 and 1:1,000,000).8

However, there is also evidence that flu infection itself may be a trigger for Guillain-Barré syndrome and that this risk may be greater than the risk from vaccination.9

In the absence of clear evidence on the balance of risks and benefits relating to adverse events such as Guillain-Barré syndrome, WHO have advised intensive surveillance for any side effects during and after any vaccine programme. In the UK the HPA has announced an enhanced surveillance programme specifically for Guillain-Barré syndrome.10 11"

H1N1 flu shot clinics set to close in parts of Ontario

The Star (Toronto) // The Canadian Press, 27 November 2009
https://www.thestar.com/life/health-wellness/h1n1-flu-shot-clinics-set-to-close-in-parts-of-ontario/article_9be88d40-1f52-511d-8ccd-79828180fd6e.html

Toronto – The time to roll up a sleeve to get an H1N1 flu shot is coming to an end at some public clinics in Ontario.

Some health units are seeing a drop in both H1N1 activity and demand for the swine flu shot and plan to wind down their mass vaccination clinics, even as the death toll from H1N1 rises in the province.

Other areas are adding clinics due to increased demand, while still others are transitioning clinics to now provide the seasonal flu shot.

Hamilton's last date for its mass H1N1 vaccination clinics will be Dec. 4, although residents can still get the swine flu shot from their family doctor or through the city's regular immunization clinics.

"We've seen a drop in the number of people visiting our clinics so we will be looking at the more traditional routes available for vaccinations such as family doctors and walk-in clinics," Dr. Elizabeth Richardson, Hamilton's medical officer of health, said in a statement.

H1N1 activity is down in Hamilton, but officials still encourage people to get vaccinated, she said.

In Stratford, the Perth District Health Unit plans to close its public H1N1 clinics on Dec. 1.

Toronto Public Health is still seeing a steady stream of people wanting the flu shot. It will close two clinics on Sunday that have had a drop in attendance, but its eight other clinics will stay open until mid December.

"We are still vaccinating around 7,000 people a day at our clinics," said spokeswoman Susan Sperling.

Toronto Public Health said it will monitor attendance daily to determine the final day of the other eight clinics.

However it will also close two more of the five Flu Assessment Centres Friday. One closed earlier this week.

In Ottawa, there are no immediate plans to close mass vaccination clinics but the health unit continues to monitor demand closely and will adjust clinic hours accordingly, said Dr. Isra Levy, medical officer of health.

"Ottawa Public Health continues to see interest from the public for the vaccine and we continue to vaccinate several thousand people each day at our clinics," said Levy.

Ottawa will promote vaccination well into the new year. The vaccine will protect people when they gather for parties and other festivities as the holiday season approaches, he said.

H1N1 activity may be slowing down in the community, he suggested, as fewer schools are reporting higher absenteeism rates, and patient levels in Ottawa hospital emergency rooms are returning to normal.

Clinics will run through Dec. 8 in Windsor-Essex, which has been vaccinating more than 1,000 people a day, said that region's medical officer of health Dr. Allen Heimann.

However the clinics are transitioning to give the seasonal flu shot, he said, as the area experiences a decline in H1N1 activity.

"That's certainly the trend across the province," Heimann said.

Niagara Region will decide whether to extend its clinics past Dec. 4 after assessing this week's demand.

It's been vaccinating more than 1,400 individuals per day but has seen a drop in lab-confirmed cases of H1N1, and school absenteeism from the flu is also decreasing, said Niagara Region Public Health spokeswoman Carrie Beatty.

"The Niagara Health System continues to see patients with flu but the numbers have dropped significantly since the H1N1 outbreak began in late October," said Niagara Health System spokeswoman Caroline Bourque Wiley.

All of Niagara's hospital services and operations, including surgical schedules and emergency room volumes, are back to normal, she added.

The Simcoe Muskoka District Health Unit is extending its clinics into the first two weeks of December, saying illness remains high in the area. Chatham extended its clinics until Dec. 5, while Waterloo added clinics through Dec. 3 because of demand.

The Ministry of Health has never had an expectation about how long public vaccination clinics should run, said spokesman David Jensen.

"We have full confidence that local public health units, gauging the demand they're experiencing from their communities, will be able to determine the best and most effective way to operate the H1N1 clinics," he said.

Ontario has had 95 lab-confirmed H1N1 deaths since April.

Jensen said most people in Ontario have not been immunized.

The ministry is encouraging people to get their shots now, he said.

The vaccine is available at more than 4,400 physician offices across the province, he added.

Ontario has received almost 5.9 million doses of vaccine. Next week, it will get at least another 1.1 million doses, and could get an additional one million doses beyond that.

Grippe A: 22 décès en une semaine (Bachelot)

Challenges, 27 Novembre 2009 à 17h06
https://www.challenges.fr/monde/grippe-a-22-deces-en-une-semaine-bachelot_360699

La France métropolitaine comptabilise 68 cas mortels liés au virus et le Canada 24 cas d'anaphylaxie dont 1 mortel. L'anaphylaxie est une grave réaction allergique qui provoque l'obstruction des voies respiratoires.

La ministre de la Santé, Roselyne Bachelot, a indiqué, jeudi 26 novembre, que le pays comptait 22 nouveau cas mortels liés à la grippe A/H1N1 en une semaine. L'épidémie "s'accélère", a redit la ministre.

"Cette accélération concerne maintenant la quasi-totalité du territoire national" et 730.000 consultations pour des symptômes grippaux ont été recensées pour la semaine du 16 au 22 novembre, soit 72% de plus que la semaine précédente. Elle a en outre précisé que "121 personnes atteintes du virus sont actuellement hospitalisées en unité de réanimation ou en soins intensifs". "Nous nous attendons à observer les premières tensions sur le système hospitalier", a ajouté Roselyne Bachelot.

Le ministère de l'Intérieur avait lui confirmé mardi une progression de la fréquentation des centres de vaccination contre la grippe pandémique A/H1N1 avec 65.000 personnes par jour contre 13.000 au lancement, le 12 novembre, de la campagne de vaccination collective dans les 1.060 centres installés sur le territoire national.

Réquisition des étudiants

Sur ce point, la ministre de l'Enseignement supérieur Valérie Pécresse a annoncé sur LCI qu'elle souhaitait que des étudiants en médecine puissent participer aux vaccinations contre la grippe A/H1N1. "Je vais proposer aux présidents d'université et aux doyens des facultés de médecine d'aménager les horaires des étudiants en médecine de manière à ce qu'ils puissent être plus nombreux dans les centres de vaccination", a-t-elle dit.

Ces étudiants, "qui ont déjà 4 ou 5 ans de formation", ne seront pas rémunérés mais seront mobilisés sur le principe de la réquisition", a précisé Valérie Pécresse.

"Sur la base des recommandations émises par l'Agence européenne (du médicament), la vaccination sera réalisée avec une seule injection, à l'exception de certaines tranches d'âge", a fait savoir Roselyne Bachelot. Ainsi, "les jeunes de moins de neuf ans recevront toujours deux injections car la protection immunitaire est plus difficile à obtenir chez eux".

2.726.000 personnes ont été infectées par le virus grippal pandémique H1N1 en France depuis le mois d'août, selon les estimations du réseau des Groupes régionaux d'observation de la grippe (Grog) diffusées mercredi.

24 cas d'anaphylaxie chez les Canadiens vaccinés

De l'autre côté de ol'Atlantique, le directeur de l'Agence de santé publique du Canada a fait de son côté état de 24 cas d'anaphylaxie confirmés, dont un mortel, parmi les Canadiens vaccinés contre le virus A/H1N1. Le Dr David Butler-Jones a indiqué que la personne décédée après avoir reçu le vaccin, identifiée par les médias comme étant un octogénaire du Québec, présentait les symptômes

liés à l'anaphylaxie, une grave réaction allergique qui provoque l'obstruction des voies respiratoires. Il a toutefois précisé que la cause du décès n'avait toujours pas été déterminée et que d'autres problèmes de santé étaient peut-être à l'origine de la mort.

L'anaphylaxie a fait la "une" des journaux la semaine dernière lorsque le fabricant GlaxoSmith-Kline a ordonné aux provinces de ne plus administrer de vaccins provenant d'un lot de 172.000 doses envoyées le mois dernier. L'ordre a été donné après que six personnes ayant reçu un vaccin issu de ce lot ont subi un choc anaphylactique, soit un nombre de cas plus élevé que la normale. David Butler-Jones a cependant indiqué que le taux de réactions anaphylactiques était d'environ 0,32 cas pour 100.000 doses administrées, ce qui demeure dans les normes pour les campagnes de vaccination massives.

Par ailleurs, dans leur premier rapport sur la question publié mercredi, les autorités sanitaires américaines ont relevé qu'il n'existait aucune preuve que le vaccin contre le A/H1N1 comportait des effets secondaires importants.

French medical students
to be Requisitioned to work in Swine Flu jab Centres, no pay

The Flu Case, 28 November 2009, 17:06
https://web.archive.org/web/20100102043725/http://theflucase.com/index.php?option=com_content&view=article&id=2115%3Afrench-medical-students-to-be-requisitioned-to-work-in-swine-flu-jab-centres-no-pay&catid=1%3Alatest-news&Itemid=64&lang=en

French medical students are going to be requisitioned to work in the country's vaccine centers without pay under plans announced by Valerie Pecreese, the Minister of Higher Education, reports unisfaceauvaccin.org.

She said that the medical students would not be paid but would be mobilised using a law allowing them to be "requisitioned."

Burkhalter will Impfzwang für Gesundheitspersonal

News.Ch, 27 November 2009, 18:42 h
https://web.archive.org/web/20091130230353/http://www.news.ch/Burkhalter+will+Impfzwang+fuer+Gesundheitspersonal/416920/detail.htm

Bern - Gesundheitsminister Didier Burkhalter ist für einen Impfzwang für das Pflegepersonal. Wenn die Pandemie komme und die Situation schlimmer werde, müssten sich alle Pflegepersonen zwangsweise impfen, sagte der Bundesrat in der «Tagesschau» des Schweizer Fernsehens. (fkl/sda)

«Wenn man pflegen will, muss man sich impfen», sagte Burkhalter. Die Diskussion über den Impfzwang müsse deshalb jetzt schon geführt werden. Es sei wichtig, dass das Pflegepersonal ein Bewusstsein dafür entwickle.

Der Schweizer Berufsverband der Pflegefachfrauen und -männer (SBK) empfiehlt seinen Mitgliedern eine Impfung gegen die Schweinegrippe. Der SBK erwartet von Pflegefachpersonen, dass sie die Entscheidung nach einer Auseinandersetzung mit den Fakten und dem Gefährdungspotential in ihrem Arbeitsalltag fällen.

Der Entscheid für oder gegen eine Impfung sei aber letztendlich ein persönlicher Entscheid, den es zu respektieren gelte, teilte der Verband mit. Aus verschiedenen Gründen verhalte sich ein beträchtlicher Teil der Pflegefachleute zum gegenwärtigen Zeitpunkt skeptisch bis ablehnend gegenüber der Impfung gegen die Schweinegrippe.

Polemik der Medien

Diese Zurückhaltung werde in einem Teil der Medien polemisch und gehässig kommentiert, bis hin zu Angriffen auf die Professionalität und die moralische Integrität der Pflegenden. Auch schreckten etliche Arbeitgeber vor massivem Druck nicht zurück, um die Impfquote in ihren Institutionen zu erhöhen.

Der SBK zeigt sich in einer Mitteilung befremdet über diese «unqualifizierten, pauschal diffamierenden Angriffe auf Berufsleute, die tagtäglich, oft unter sehr schwierigen Arbeitsbedingungen, den Tatbeweis erbringen, dass ihre ganze Sorge dem Wohl ihrer Patienten gilt.»

Swiss Health Minister wants compulsory jab for Health care workers;
Swiss Media under fire for bullying doctors and nurses

The Flu Case, 28 November 2009, 16:50
https://web.archive.org/web/20100102043101/http://theflucase.com/index.php?option=com_content&view=article&id=2112%3Aswiss-health-minister-wants-compulsory-jab-for-health-care-workers-swiss-media-under-fire-for-bullying-doctors-and-nurses&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Swiss Health Minister Didier Burkhalter has called for the compulsory vaccination of health personnel. He told Swiss TV on Friday that all health care workers should be obliged to take the swine flu jab.

The Swiss Professional Association for Care Workers (Schweizer Berufsverband der Pflegefach-frauen und -manner, SBK) has said, however, it wants health care professionals to make their own choice after considering the facts for and against a jab, even though it recommends the jab.

Swiss health care professionals have so far shunned the untested swine flu vaccine.

The SBK health care workers association accused the Swiss media of whipping up hatred against health care professionals who refused the jab, for example, by suggesting people who refused lacked moral integrity.

In addition, some employers have shown they are willing to go to almost any lengths to increase the number of people given the jab in their institutions.

The SBK has expressed its concern over the "unqualified, undifferentiated defamatory attacks on an occupational group that proves it puts the well-being of patients first day in, day out often under very difficult conditions of work."

Schweinegrippe-Impfung heiß umstritten

ORF, 27 Novembre 2009
https://noev1.orf.at/stories/398963

Am Dienstag beginnt für das medizinische Personal die Impfaktion gegen die Schweinegrippe. Bei den Ärzten herrscht Uneinigkeit darüber, ob man sich gegen das H1N1 Virus tatsächlich impfen lassen soll.

H1N1 für Ärzte nicht erklärbares Phänomen

Viele Menschen sind verunsichert und wissen derzeit nicht, ob sie sich gegen die Schweinegrippe impfen lassen sollen. Auch bei den Ärzten gibt es stark divergierende Meinungen.

Rudolf Heschl, praktischer Arzt aus Öd bei Amstetten, rät dazu, sich vorerst einmal gegen die normale Grippe impfen zu lassen, denn bei dieser Grippe sei die Komplikationsrate wesentlich höher. Bei der normalen Grippe gibt es nämlich ca. 100.000 Krankheitsfälle. Bei der Schweinegrippe sind es hingegen derzeit bloß 400 Erkrankungen in Österreich.

Laut Heschl ist das neue Virus für die Mediziner nach wie vor ein nicht ganz erklärbares Phänomen. Außerdem sei das Risiko in Österreich an der Schweinegrippe zu erkranken sehr gering, sagt der Mediziner.

"Über Nebenwirkungen wenig bekannt"

Der Impfstoff gegen die Schweinegrippe ist durch die Zwänge rasch zu reagieren sehr schnell entwickelt und auf den Markt gebracht worden, so der Arzt aus Öd.

Über etwaige Nebenwirkungen gibt es derzeit zu wenige Informationen. Hier gibt es, so Heschl, einen hohen Unsicherheitsfaktor. Er selbst sagt, dass er sich zwar gegen die normale Grippe, aber nicht gegen die Schweinegrippe impfen lässt.

Auch das Zurückgreifen auf das Medikament Tamiflu, das im Jahr 2005 aufgrund der Vogelgrippe eingekauft und eingebunkert wurde, wäre bei einer Schweinegrippepandemie eine Möglichkeit, sagt Heschl, denn das Medikament würde 2010 sowieso ablaufen.

Wien ORF.at

Schweinegrippe: 45.000 Impfungen in Wien

Wien ORF, 27 Novembre 2009.
http://wien.orf.at/stories/406116/ (deleted)

Rund 45.000 Menschen haben sich bisher gegen die Schweinegrippe in Wien impfen lassen. Die Phase der ersten Teilimpfung hat vor drei Wochen begonnen. Am Montag läuft die zweite Phase an.

4.300 in der dritten Woche

Den stark rückläufigen Trend bei den Impfungen dokumentiert ein Vergleich der drei Wochen. In der ersten Woche ließen sich rund 28.900 Menschen impfen, in der zweiten Woche 11.508 und in der dritten Woche knapp 4.300.

Die Gesundheitsbehörden gehen davon aus, dass sich die Tendenz nun wieder verstärkt. Am Montag beginnt die zweite Phase der Immunisierung.

Zweite Teilimpfung empfohlen

"Besonders chronisch kranke und abwehrgeschwächte Personen, bei denen die Immunantwort eventuell bei der ersten Impfung schwächer ausgefallen ist und damit auch früher nachlässt, und alle, die auf Nummer sicher gehen wollen, können und sollen sich ein zweites Mal impfen lassen", so Ursula Karnthaler von der Landessanitätsdirektion.

Aufgrund der sinkenden Nachfrage werden auch die Zeiten der H1N1-Infohotline zurückgefahren. Die Information der Agentur für Gesundheit und Ernährungssicherheit zur Schweinegrippe ist dann von Montag bis Freitag von 8.00 bis 17.00 Uhr erreichbar.

THE FLU CASE

Dramatic Drop in Austrians Taking Swine Flu Jab Continues in Third Week

The Flu Case, 28 November 2009 11:41
https://web.archive.org/web/20100102032353/http://theflucase.com/index.php?option=com_content&view=article&id=2108%3Asteepening-decline-in-austrians-taking-swine-flu-jab-continues-in-third-week&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The dramatic decline in the numbers of people in Austria taking the swine flu jab has continued into the third week of the national mass swine flu vaccination campaign.

Only 4,300 people in the capital city of Vienna went to take the jab last week, down from 11, 508 in the second week and 28,900 in the first week, reports state-run ORF.

Vienna has a population of about 1.7 million people: so far 45,000 people have taken the jab.

The low numbers of people turning out to take the new and untested swine flu jab represents a triumph of common sense over an unprecedented barrage of misinformation pumped out by pharmaceutical companies, governments, WHO and the media, which have systematically concealed the serious side effects of the swine flu vaccine in their rush to make profits.

For Sale: 19 million doses of Pandemic vaccine, as good as new

Science, 28 Nov 2009; doi: 10.1126/article.41176
https://www.science.org/content/article/sale-19-million-doses-pandemic-vaccine-good-new

Amsterdam – The Netherlands is selling the bulk of its H1N1 pandemic vaccine supply. Some 19 million doses of the 34 million doses that the government has ordered from manufacturers Novartis and GlaxoSmithKline are now for sale, Health Minister Ab Klink wrote yesterday in a letter to Parliament. Some 2 million of them will be available in December, the remainder in the first months of 2010. Malta and Macedonia have been reported to be among the potential buyers.

The Netherlands is one of the few countries that decided early on in the pandemic to order two doses of vaccine for each of its citizens. But like most countries, it ended up only vaccinating certain groups, such as pregnant women, people with medical conditions that put them at greater risk, health care workers, the elderly, and children aged between 6 months and 4 years. Even if the sale goes through, the Netherlands will still keep a strategic stockpile of 2.2 million vaccines.

THE FLU CASE

German Vaccine Commission steps back from the Brink,
says one dose of toxic jab is now enough

The Flu Case, 28 November 2009, 11:53 ...
https://web.archive.org/web/20100102041933/http://theflucase.com/index.php?option=com_content&view=article&id=2110%3Agerman-vaccine-commission-steps-back-from-the-brink-says-one-dose-of-toxic-jab-is-now-enough&catid=1%3Alatest-news&Itemid=64&lang=en

The German vaccine commission STIKO is expected to announce at the beginning of December that doctors should not give the second injection of the swine flu vaccine Pandemrix.

The change in guidelines comes as reports of death and damage to people who took the first of the two injections recommended for Pandemrix by STIKO continue to flood in.

The members of STIKO have come under criticism for their links to the pharamceutical companies producing the swine flu vaccine.

The Health Authorities in Frankfurt am Main have already changed the rules to give healthy people between the ages of 10 and 80 years old only one jab.

Gesundheitsamt:
Keine zweite Schweinegrippe-Impfung für Gesunde zwischen 10 und 80 Jahren

Neu-Isenburg (gwa). Anfang Dezember werden die neuen Empfehlungen der Ständigen Impfkommission STIKO zu Impfungen gegen Schweinegrippe erwartet. Bereits jetzt impft zum Beispiel das Gesundheitsamt in Frankfurt am Main gesunde Menschen zwischen 10 und 80 Jahren kein zweites Mal, wie die "Ärzte Zeitung" erfuhr.

Immer wieder wird diskutiert, ob eine einmalige Impfung mit dem in Deutschland genutzten Impfstoff Pandemrix® reicht, oder ob zweimal geimpft werden muss, um eine ausreichende Immunisierung gegen das neue H1N1-Virus zu induzieren. Für Kinder zum Beispiel genügt eine Impfung, wie der Virologe Professor Peter Wutzler aus Jena bestätigt.

Die europäische Behörde ECDC rät zu nur einer Impfung bei Menschen über 60 Jahren. Die STIKO empfiehlt bislang zwei Impfungen.

Für Anfang Dezember werden die neuen STIKO-Empfehlungen zur Schweinegrippe-Impfung erwartet, etwa zur Impfung gesunder Menschen. Bereits jetzt aber impft das Gesundheitsamt Frankfurt am Main Gesunde zwischen 10 und 80 Jahren nur noch einmal, wie die "Ärzte Zeitung" erfuhr. So berichtete ein Arzt, dass das Gesundheitsamt den Termin zur zweiten Impfung gestrichen habe mit Hinweis auf neue Empfehlungen.

Grippe A: des médecins militaires en renfort pour vacciner

Le Parisien, 28 Novembre 2009 à 07h33
https://www.leparisien.fr/societe/sante/grippe-a-des-medecins-militaires-en-renfort-pour-vacciner-28-11-2009-727010.php

Des moyens complémentaires vont être mis oeuvre pour renforcer les centres de vaccination collective, répondant ainsi au souhait du président de la République. «650 internes sont mobilisés quotidiennement dans les centres, des médecins du travail viennent renforcer les centres de vaccination et enfin, le service de santé des armées va être appelé en renfort», annonce un communiqué du ministère de l'Intérieur.

«Les centres de vaccination collective sont ouverts depuis le jeudi 12 novembre dernier», rappelle le ministère, soulignant que «depuis une semaine, l'adhésion de la population à la vaccination contre le virus A(H1N1) est en forte augmentation, provoquant, souvent et essentiellement dans les centres urbains, des tensions sur le dispositif mis en place».

«Des instructions ont été données aux préfets pour, d'une part, ouvrir très rapidement les 1.080 centres installés sur l'ensemble du territoire métropolitain (2/3 à ce jour sont d'ores et déjà ouverts) et, d'autre part, en allonger les plages d'ouverture et accroître leur capacité, notamment les mercredis et les samedis», précise l'Intérieur.

Face aux couacs et aux files qui s'allongent dans les centres de vaccination contre la grippe H1N1, Nicolas Sarkozy avait appelé vendredi au calme et à la mobilisation, depuis Trinidad-et-Tobago, où il participait au sommet du Commonwealth. «Il faut garder notre sang-froid, faire en sorte de ne pas surréagir en permanence», avait rappelé le chef de l'Etat.

Vaccination contre la grippe A:
des moyens complémentaires et l'armée à la rescousse

Le Point, 28 Novembre 2009, à 12h42
https://web.archive.org/web/20091201021149/http://www.lepoint.fr/grippe-a-h1n1/2009-11-28/h1n1-vaccination-contre-la-grippe-a-des-moyens-complementaires-et-l/2024/0/399886

Des moyens complémentaires vont être mis oeuvre pour renforcer les centres de vaccination collective et notamment le renfort des services de santé des armées, a annoncé samedi le ministère de l'Intérieur. "650 internes sont mobilisés quotidiennement dans les centres, des médecins du travail viennent renforcer les centres de vaccination et enfin, le service de santé des armées va être appelé en renfort", selon un communiqué du ministère.

"Les centres de vaccination collective sont ouverts depuis le jeudi 12 novembre dernier", rappelle le ministère, soulignant que "depuis une semaine, l'adhésion de la population à la vaccination contre le virus A(H1N1) est en forte augmentation, provoquant, souvent et essentiellement dans les centres urbains, des tensions sur le dispositif mis en place".

"Des instructions ont été données aux préfets pour, d'une part, ouvrir très rapidement les 1.080 centres installés sur l'ensemble du territoire métropolitain (2/3 à ce jour sont d'ores et déjà ouverts) et, d'autre part, en allonger les plages d'ouverture et accroître leur capacité, notamment les mercredis et les samedis", précise l'Intérieur. => English version of the articles is on the next page

THE FLU CASE

French Army to be used in Swine Flu vaccine centres

The Flu Case, 28 November 2009, 16:33

https://web.archive.org/web/20100102054756/http://theflucase.com/index.php?option=com_content&view=article&id=2111%3Afrench-army-to-be-used-in-swine-flu-vaccine-centres&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French army's medical corps is to help carry out vaccinations in the country's 1080 vaccine centers, according to an announcement by the French Ministry of Interior today, Saturday.

The army is being called in along with doctors and other health care personnel to operate the controversial centers and administer the untested swine flu jab in spite of – or because of? – evidence of a low voluntary up take of the jab among the population.

According to French government figures only about 300,000 people have taken the jab so far in spite of extreme pressure from the health ministry and daily media hype about the alleged dangers of the swine flu.

A secret French government document leaked in August revealed plans by Health Minister Roselyn Bachelot to vaccinate the entire population between the end of September and January in the specially established centers, many of which have extra security features.

Also, secret documents from the Justice Ministry showed that plans were in place to allow the imprisonment of people for up to six months without being charged under the pretext of controlling a pandemic emergencies.

This week, French police intervened to shut down a school by force in spite of protests by the local Mayor and school director, who said there was no evidence of a swine flu pandemic in their school.

400 schools in France have been shut in the past couple of weeks as the government propagates the myth of a country under siege from the swine flu.

The decision to draft in the highly controversial French medical corps, which has played a key role in guarding and distributing the swine flu jabs, will raise fears in France that the government is using the pandemic as an excuse to hollow out civic rights and that the move to a compulsory vaccination of the population is on the cards.

EU approves single dose swine flu vaccine

The Hindu, 30 November 2009, 05:50 pm
https://www.thehindu.com/sci-tech/health/medicine-and-research/EU-approves-single-dose-swine-flu-vaccine/article16895057.ece

Brussels (AP) – The European Union's executive commission says it has approved single doses of two swine flu vaccines that could speed up winter vaccinations.

The European Commission's Monday authorization of single shots of Novartis AG' Focetria and GlaxoSmithKline's Pandemrix replaces the use of two doses of the vaccine against the H1N1 virus for adults and older children.

Older people over the age of 60 must be vaccinated with two doses of Focetria but can be treated with one dose of Pandemrix.

EU spokesman Tom van Lierop said regulators were still assessing the safety of a single shot of a third vaccine, Celvapan, made by Baxter.

Vaccination obligatoire: le tabou est brisé

Le Matin, 30 Novembre 2009

http://archives.lematin.ch/LM/LMD/-/article-2009-11-355/dans-les-hopitaux-universitaires-de-lausanne-et-de-geneve-25-a-30-du-personnel-se-sont-fait. (deleted)
https://web.archive.org/web/20100102041337/http://theflucase.com/index.php?option=com_content&view=article&id=2122%3Aswiss-media-and-health-officials-step-up-campaign-for-forced-vacccination-of-health-personnel&catid=1%3Alatest-news&Itemid=64&lang=en

Dans les hôpitaux universitaires de Lausanne et de Genève, 25 à 30% du personnel se sont fait vacciner contre la grippe A à ce jour. Un succès considérable, disent les directions des deux établissements. En coulisses pourtant, ils ont moins fière allure. Car ils sont conscients que leurs employés ne montrent pas vraiment l'exemple. «Se vacciner pour se protéger et protéger les autres», dit depuis des semaines l'Office fédéral de la santé publique…

Pour protéger les patients les plus faibles, les Hôpitaux universitaires de Genève (HUG), ont instauré un système de badges indiquant que tel médecin ou telle infirmière a été immunisé («Le Matin Dimanche» du 8 novembre). Les autres sont obligés de porter le masque dès qu'ils sont en contact avec les patients.

Protéger les patients en oncologie et les grands prématurés

Bernard Gruson, directeur des HUG, aurait préféré une solution plus simple: «Cela ne m'aurait pas choqué que l'on impose la vaccination aux professionnels», dit-il. En particulier dans des services avec des patients très vulnérables, comme en oncologie ou chez les grands prématurés. «Mais une telle mesure n'est pas légale et ne peut pas être imposée», ajoute le patron des HUG.

Parmi les professionnels de la santé, Bernard Gruson n'est pas le seul à poser la question d'une vaccination obligatoire. Jacques de Haller, président de la fédération des médecins suisses (FMH), est lui aussi prêt à franchir le pas. Tant que la dangerosité du virus reste limitée, il préfère privilégier les libertés individuelles, mais «en cas de virus dangereux, comme l'a été le SRAS par exemple, c'est une question qui se pose.»

Se préparer à la pandémie suivante

Et d'ajouter que si l'on est «vraiment professionnel», on sait que ce vaccin contre le virus H1N1 ne pose «aucun problème». Le port du masque par le personnel soignant protège moins bien les patients, selon Jacques de Haller. «Mieux vaut que les soignants soient vaccinés.»

Toutes ces questions ne se posent pas avec une très grande acuité dans le cas de la grippe A, car le virus est finalement moins virulent que l'on craignait. Mais tout le monde sait qu'une pandémie beaucoup plus grave finira par arriver.

«Le débat sur l'obligation pour le personnel soignant de se faire vacciner doit avoir lieu. Sans tabou», espère Eric Masserey, médecin cantonal adjoint vaudois. Non seulement avec à l'esprit la prévention d'une contamination de patients, mais aussi en regard de la disponibilité des soignants. Si beaucoup d'entre eux sont malades, cela peut conduire à des situations très problématiques, surtout en situation de crise, explique-t-il.

Directeur adjoint de l'Institut du droit de la santé de l'Université de Neuchâtel, Dominique Sprumont estime lui aussi que la Suisse n'échappera pas à une discussion.

Dans un avis de droit qu'il vient de rendre ce vendredi au Département de la santé du canton de Vaud, le professeur conclut qu'il serait légal d'obliger tous les soignants et tout le personnel en contact avec la petite enfance (garderies, crèches, mamans de jour, etc.) à se faire vacciner contre la rougeole. Si le chef du département Pierre-Yves Maillard le confirme, ce serait une première nationale.

Et cela montrerait qu'un canton peut très bien imposer la vaccination à certaines catégories de la population, comme le prévoient les articles 19 et 23 de la loi fédérale sur les épidémies.

Dans la pesée d'intérêts pour savoir s'il faut franchir ce pas, quatre facteurs sont déterminants selon le professeur Sprumont: le degré de contagiosité de la maladie, la gravité de la maladie, la sûreté du vaccin et l'efficacité du vaccin.

Vacances forcées pour récalcitrants

Dans le cas de la grippe A, ces facteurs ne sont pas tous réunis, estime-t-il. «Mais pour protéger les patients particulièrement vulnérables, dit Dominique Sprumont, on peut déjà justifier la mise à l'écart du personnel non vacciné des services concernés. » Y compris en les mettant en vacances forcées.

L'Etat de New York, lui, va plus loin. Depuis quelques semaines, il oblige les soignants à se faire vacciner contre la grippe saisonnière et le virus H1N1. Sans surprise, des employés ont fait recours, mais selon le New England Journal of Medicine, paru ce jeudi, ils ont peu de chance de l'emporter.

Aux Etats-Unis, la responsabilité portée par l'institution a davantage de poids que la responsabilité individuelle. Du reste, l'Arkansas exige que les enfants qui entrent à l'école soient vaccinés contre l'hépatite B.

Cette doctrine s'imposera-t-elle un jour en Suisse? «En Suisse alémanique, où le taux de vaccination contre la rougeole est trop faible pour présenter une protection efficace (70% contre 95% en Suisse romande), dit Dominique Sprumont, je peux m'imaginer qu'on oblige la population à se faire vacciner. Et cela serait légalement justifiable.» Et de rappeler qu'en janvier dernier, une fille de 13 ans est morte à Genève à cause de la rougeole. Y

THE FLU CASE

Swiss Media and Health Officials step up Campaign for Forced Vaccination of Health Personnel

The Flu Case, 30 November 2009, 12:01
https://web.archive.org/web/20100102041337/http://theflucase.com/index.php?option=com_content&view=article&id=2122%3Aswiss-media-and-health-officials-step-up-campaign-for-forced-vacccination-of-health-personnel&catid=1%3Alatest-news&Itemid=64&lang=en

The Swiss media and health authorities are pushing the idea that the emergence of a virulent swine flu virus is inevitable and that health care professionals need to be required to take the swine flu jab by law.

However, many experts have argued *a virulent virus has only started to emerge now after many millions of swine flu vaccines were given to people*, underlining fears that there will be a repeat of the vaccine-generated pandemic as was the case with the Spanish Flu in 1918-1919.

Greece which did not mass vaccinate people in 1918-1919 had no deaths from the Spanish Flu.

We do not know how many of the people who have come down with the symptoms of the virulent swine flu recently, for example, in Polka County, Iowa, got the swine flu jab beforehand.

The forced vaccination of the Swiss health professionals based on series of fraudulent claims concerning the virus, its origin and the safety and efficacy of vaccine (which has not been proven according to the EMEA's own documents), will lead to an increase in sicknesses and death among the personnel (which will be attributed to the virus) and to the breakdown of the health services and could give the government an excuse to implement martial law.

This is a report in the Swiss news paper Le Matin advocating the false idea that a virulent virus is natural and inevitable and supporting the forced vaccination of health personnel with an untested and dangerous jab:

Obligatory vaccination: the taboo is broken
Titus Plattnertitus. plattner@edipress. CH

In the university hospitals of Lausanne and Geneva, 25 to 30% of the personnel have been vaccinated against the swine flu to date. A considerable success, say the directors of two establishments.Behind the curtains, though, they have are less than pleased. Because they are aware their employees do not show the kind of example they want. "To vaccinate onself is to protect and protect the others", the Federal Office of public health has been saying for weeks…

To protect the weakest patients, the University hospitals of Geneva (HUG), founded a system of badges indicating that such doctor or such nurse was immunized ("the Morning Sunday" of November 8). Others are obliged to war a mask as soon as they are in contact with patients.

To protect the patients in oncology and premature cares

Bernard Gruson, director of the HUG, would have preferred a simpler solution: "It has not have shocked me that they are trying to impose the vaccination on professionals", he says. In particular in

services with very vulnerable patients, as in oncology or at the large premature ones. "But such a measurement is not legal and cannot be imposed", adds the boss of HUG.

Among health professionals, Bernard Gruson is not the only one to raise the question of an obligatory vaccination. Jacques de Haller, president of the federation of the Swiss doctors (FMH), has also taken the step. As long as the danger of the virus remains limited, he prefers to allow individual freedoms, but "in the event of dangerous virus, like was to it the SARS for example, it is a question which arises. "

To prepare for the coming pandemic

He adds if one is "really professional", one knows that this vaccine against virus H1N1 does not pose "any problem". Wearing a mask by medical staff offers far less protection to patients, according to Jacques de Haller. "More v alue for looking after patients are the vaccinated."

All these questions do not arise with a very great acuity in the case of the siwn flu, because the virus is has proved less virulent than one feared. But everyone knows that a more serious pandemic will end up arriving.

"The debate on the obligation for medical staff to be made vaccinate must take place. Without tabu", says Eric Masserey, associated cantonal doctor of Vaud. Not only with the spirit prevention of a contamination of patients, but also in respect to the question of the availability of staff. If many health care personnel are sick, that can lead to very problematic situations, especially in crisis situation, he explains.

Director of the Institute of the right of the health of the University of Neuchâtel, Dominique Sprumont also believes Switzerland will not escape a discussion on obligatory vaccination.

In an opinion on the law, which it has just returned this Friday to the Department of the Health of the canton of Vaud, the professor concludes that it would be legal to oblige all health care professionals and all personnel in contact with early childhood (nurseries, cribs, moms of day, etc) to be forced to be vaccinated against measles. If the chief of the department Pierre-Yves Maillard confirms it, it would be a first in the country.

And that would show that a canton can indeed impose vaccination on certain categories of the population, as articles 19 and 23 of the federal law state in the case of epidemics.

In the weighing of interests to know if this step should be crossed, four factors are determining according to Professor Sprumont: the degree of contagiousness of the disease, the gravity of the disease, the safety of the vaccine and effectiveness of the vaccine.

Forced holidays for recalcitrant

In the case of the swine flu, these factors are not joined together, estimates it. "But to protect the particularly vulnerable patients, known as Dominique Sprumont, one can already justify the setting with the variation of the personnel not vaccinated of the services concerned. " Including by putting them on a forced holiday.

The State of New York, so he says, goes further. A few weeks ago, it obliged health care personnel to take the vaccine against the seasonal flu and virus H1N1. No surprise, employees took legal action, but according to New England Journal of Medicine, published this Thursday, they have little chance to win.

In the United States, the responsibility carried by the institution has more weight that the individual responsibility. Reminder, Arkansas requires that the children who enter to the school be vaccinated against hepatitis B.

Will these doctrines be essential one day in Switzerland? "In German-speaking Switzerland, where the rate of vaccination against measles is too weak to present an effective protection (70% compared with 95% in French-speaking Switzerland), known as Dominique Sprumont, I can think that one obliges the population to be made vaccinate. And that would be legally justifiable. " And to recall that last January, a 13 year old girl died in Geneva because of measles.

http://archives.lematin.ch/LM/LMD/-/article-2009-11-355/dans-les-hopitaux-universitaires-de-lausanne-et-de-geneve-25-a-30-du-personnel-se-sont-fait

Vaccination obligatoire: le tabou est brisé

Plagued with controversy

Deutsche Welle, 30 November 2009
https://www.dw.com/en/confusion-and-controversy-plague-swine-flu-vaccine/a-4939907

While roughly 65 million people worldwide have been vaccinated against swine flu, controversy over the vaccine is also spreading like a disease, with confused citizens and a medical community at odds with itself.

Even as European health officials notice a decline in the rate of people infected by the H1N1 swine flu virus,

But when the vaccination process for swine flu got underway at the end of October, clinics and doctor's offices were met with a surge of people anxious to get the H1N1 shot. While many people had to stand outside in chilly weather to wait their turn, they weren't the only ones who felt left out in the cold.

Dr. Collin Blume, an internal medicine specialist and one of about 35 doctors administering the vaccine in Duesseldorf, said the process was also unclear from the beginning for health professionals, and led to the rash implementation of a program that could have been spread over a longer timeframe.

"If you consider that we knew those things were coming maybe half a year ahead of time, I don't understand why it had to be done in such a rush," he said.

One large aspect of confusion surrounding the vaccine Pandemrix, which is produced by GlaxoSmithKline, is who should get it. With the medical community presenting contradicting opinions, Blume said he feels the information that accompanies the Pandemrix vaccination itself is the best guide.

Medical community lacks a united stance

"There were different organizations and they all had different advice and that advice even changed," he said. "Even pediatricians changed their minds to vaccinate children below three. Before that they said they couldn't be vaccinated, even though the Pandemrix allows it. And then some children died and then they said, 'Maybe it's a good idea.'"

But only certain groups of the population really need the shot right away, according to Dr. Tomas Jelinek, a specialist for tropical medicine and infectious diseases and the scientific director of the Center for Travel Medicine in Duesseldorf. He said vaccinations should be limited to people in high-risk groups.

"Chronic diseases and very young children and pregnant women as well, all these risk groups we know that suffer from complications of swine flu," he said, referring to certain risk groups. "Elderly people who are healthy are not necessarily in that group. We have a group of people traveling and obviously traveling exposes you much more than staying at home and it's a good idea to vaccinate them."

Further compounding the swine flu vaccine uncertainty is the question of how many times people should get it. While some doctors have been recommending two shots for everyone, other physicians say this is only necessary for young children and the elderly.

Fear of side effects keeps many from jab

Fears about serious side effects from the vaccine are another factor preventing several people from getting the shot. But having vaccinated roughly 400 people with only a few minor side effects, Blume said concerns about serious reactions to the vaccine need to be put into a wider context.

"You have to consider that the vaccination is 0.5 milliliters," he said. "The possibility that anything can cause a cancer, and cancer's one of the major concerns, or chronic fatigue syndrome within 0.5 milliliters is very, very rare."

A broader question that's been raised against the backdrop of the swine flu vaccination is whether vaccines even work. Even in years when viruses have mutated to the point they make vaccines ineffective, mortality rates did not increase, according to some studies.

Vaccines still best shot

While Jelinek from the Center for Travel Medicine admitted this can happen, he said vaccines are still our best shot when it comes to protecting ourselves against influenza, despite that they are produced months before the actual strains of seasonal flu can be determined.

"You have to take the best guess and then you have to start to produce the vaccine," he said. "You can't wait until you see which strain is going to make the next influenza wave because then it's too late. But we have long experience with vaccination now. We simply know that they work."

Le Monde

H1N1: le ministère de la défense prêt à participer à la campagne de vaccination

Le Monde avec AFP, 30 novembre 2009, à 11h22

https://www.lemonde.fr/epidemie-grippe-a/article/2009/11/30/h1n1-nicolas-sarkozy-demande-l-ouverture-des-centre-de-vaccination-le-dimanche_1273914_1225408.html

Ce week-end, les autorités ont annoncé l'augmentation des capacité de centres et l'allongement de leurs horaires d'ouverture.

Les centres de vaccination contre la grippe H1N1 ont connu une soudaine affluence ces jours derniers, ce qui a conduit les autorités à annoncer, pendant le week-end, l'augmentation de leur capacité et l'allongement de leurs horaires d'ouverture dès la semaine prochaine.

Lundi 30 novembre, les choses s'accélèrent. Nicolas Sarkozy demande l'ouverture des centres le dimanche. Plus tôt dans la matinée, le ministre de la défense Hervé Morin a dévoilé les mesures que pourrait prendre le ministère de la défense, dans le cadre de la campagne de vaccination contre la grippe A (H1N1). "On est tout à fait capable, au titre des armées, de mettre entre 100 et 150 équipes vaccinales (un médecin et une infirmière)", a expliqué M. Morin sur France-Inter, en précisant que cette mise à disposition était "dans les plans".

"Il y a quinze jours, personne ne voulait se vacciner, aujourd'hui le mouvement est exactement inverse", a ajouté le ministre de la défense, en soulignant qu'il existait "des moyens complémentaires" (...), une capacité de monter en puissance, si la demande devenait plus forte". "Les réservistes peuvent faire partie des recrues complémentaires pour faire la vaccination. On est en train d'aborder ces sujets-là", a-t-il précisé.

"On est capables aujourd'hui d'envoyer au moins une centaine d'équipes médicales sous quelques jours pour compléter la vaccination, et nous pourrons faire appel ensuite aux réservistes", a encore dit Hervé Morin. Le ministre de la défense a également indiqué que l'armée assurait la vaccination de 40 000 soldats et militaires, jugée nécessaire au maintien du système de défense français.

Grippe A (H1N1): l'ouverture des centres de vaccination le dimanche, c'est pas gagné

20 Minutes, 30 novembre 2009, à 00h00
https://www.20minutes.fr/france/367370-20091130-grippe-h1n1-ouverture-centres-vaccination-dimanche-gagne

SANTE Le chef de l'Etat a réuni les ministres concernés, l'occasion de faire le point sur le dispositif en place et les améliorations à y apporter…

Travail du dimanche, le retour. Puisque la grippe A (H1N1) ne prend pas de congés, Nicolas Sarkozy a demandé au gouvernement ce lundi d'ouvrir les centres de vaccination le dimanche pour faire face à l'afflux de candidats à l'injection.

Reste que ce sera «à chaque préfet de prendre sa décision. Les centres sont sous leur responsabilité, c'est à eux d'appliquer les directives en fonction de leurs besoins», expliquait-on ce lundi soir au ministère de l'Intérieur, qui n'était pas à même d'indiquer si des centres seraient ouverts dimanche prochain. En tout cas, la mesure «n'est pas envisagée pour le moment» en Essonne, où on se concentre sur une extension des horaires d'ouvertures en semaine, comme en Gironde ou dans les Pays-de-la-Loire. A la préfecture du Rhône, la question est par contre «sérieusement envisagée», mais l'ouverture dominicale ne se fera probablement que dans les grands centres de vaccination situés en zones urbaines, où l'affluence est importante.

Améliorer l'accueil et l'information au public

L'Elysée a par ailleurs indiqué qu'à partir de mercredi, «plusieurs centaines d'internes en médecine, de médecins du travail et de médecins du service de santé des armées seront affectées» dans les centres de vaccination. «On est tout à fait capable, au titre des armées de mettre entre 100 et 150 équipes vaccinales (un médecin et une infirmière)», avait annoncé plus tôt le ministre de la Défense Hervé Morin sur France Inter.

Et en attendant l'ouverture le dimanche, les plages d'ouverture des centres «sont élargies dès cette semaine, en particulier le mercredi, le samedi et en début de soirée», a par ailleurs affirmé un communiqué de l'Elysée. D'autres efforts ont été réclamés aux ministres présents concernant «la qualité de l'accueil dans les centres de vaccination» et l'information au public «sur le fonctionnement des centres et sur les vaccins».

Pas question, cependant, de distribuer les vaccins monodoses aux généralistes, qui souhaitent participer à la campagne. «Nous n'avons pas trois millions de doses» de vaccins à dose unique, a affirmé Roseline Bachelot sur RMC/BFM-TV. La ministre de la Santé assure ne disposer que de 250.000 vaccins à monodose sans adjuvant et 500.000 avec adjuvant.

Pas de vaccins pour les généralistes

«Ces vaccins j'en ai besoin parce qu'en France, il y des gens qui ne vont ni dans les centres de vaccination, ni dans les cabinets médicaux. Ce sont les personnes fragiles, les personnes précaires», s'est justifiée Roselyne Bachelot. «Avec ça, je vaccine les sans-domicile-fixe, je donne les doses unitaires aux équipes de maraude qui vont vacciner les plus fragiles d'entre nous», a-t-elle détaillé.

La ministre de la Santé reste ainsi opposée à la vaccination dans les cabinets généralistes. Raison invoquée: «Préserver la capacité des généralistes à traiter les malades grippés.» Selon Roselyne Bachelot, le nombre de consultations pour syndrome grippal augmente de façon significative et les généralistes, très sollicités par les malades, ne sont donc pas en mesure de pratiquer les 200.000 vaccinations quotidiennes nécessaires. Ces derniers affirment le contraire.

THE FLU CASE

Grippe A/H1N1: les armées peuvent déployer entre 100 et 150 équipes vaccinales, selon Hervé Morin

The Flu Case, 30 Novembre 2009, 12h38
https://web.archive.org/web/20100102012949/http://theflucase.com/index.php?option=com_content&view=article&id=2126%3Afrance-to-mobilise-100-150-military-vaccine-teams&catid=41%3Ahighlighted-news&Itemid=105&lang=en

"Entre 100 et 150 équipes vaccinales" pourraient être mobilisées au titre des armées dans le cadre de la campagne de vaccination contre la grippe A/H1N1, a fait savoir lundi le ministre de la Santé Hervé Morin.

"On est tout à fait capable au titre des armées de mettre entre 100 et 150 équipes vaccinales", soit un médecin et une infirmière, au service de la campagne de vaccination, a-t-il déclaré sur France-Inter. "On a arrêté des plans depuis longtemps avec une capacité de monter en puissance, si la demande devenait plus forte".

"Les réservistes peuvent faire partie des recrues complémentaires pour faire la vaccination. On est en train d'aborder ces sujet-là", a ajouté Hervé Morin. "On est capable d'envoyer au moins une centaine d'équipes médicales sous quelques jours pour compléter la vaccination, et nous pouvons faire appel ensuite aux réservistes", a-t-il expliqué.

"Il y a quinze jours, personne ne voulait se faire vacciner. On nous expliquait que le gouvernement en faisait trop, que les gymnases étaient vides" et "aujourd'hui, le mouvement est exactement inverse", a observé le ministre de la Défense.

"En même temps, nous assurons la vaccination des 40.000 soldats et militaires qui ont été répertoriés comme nécessaire au maintien du système de défense français", a-t-il ajouté. AP

Vaccination: Nicolas Sarkozy souhaite que les centres ouvrent le Dimanche.
30 novembre,

Nicolas Sarkozy, qui a présidé lundi une réunion à l'Elysée sur la grippe A/H1N1, a demandé au gouvernement de prendre des "dispositions complémentaires" pour améliorer le service de vaccination contre la grippe A/H1N1, souhaitant notamment que les centres soient ouverts le dimanche.

D'ores et déjà, "plusieurs centaines d'internes en médecine, de médecins du travail et de médecins du service de santé des armées" vont renforcer les effectifs des centres à compter de mercredi prochain, a confirmé la présidence de la République à l'issue de cette réunion. De plus, les plages d'ouverture des centres sont élargies "dès cette semaine, en particulier le mercredi, le samedi et en début de soirée", précisent les services de Nicolas Sarkozy dans un communiqué.

Le chef de l'Etat a présidé lundi à l'Elysée une réunion sur la grippe A/H1N1, avec le Premier ministre François Fillon, et les ministres Brice Hortefeux (Intérieur), Luc Chatel (Education nationale), Hervé Morin (Défense) et Roselyne Bachelot (Santé).

Les ministres ont présenté au président de la République les "premières mesures" prises pour augmenter les capacités des centres de vaccination, comme Nicolas Sarkozy l'avait souhaité vendredi

dernier, selon le communiqué de l'Elysée. Le chef de l'Etat "a donné instruction au gouvernement de prendre des dispositions complémentaires pour assurer un meilleur service à la population", ajoute la présidence.

"Il a en particulier demandé que les centres de vaccination soient ouverts le dimanche", selon le communiqué. Et "la qualité de l'accueil dans les centres de vaccination devra être améliorée et une meilleure information sera faite au public sur le fonctionnement des centres et sur les vaccins". AP

Frankreich mobilisiert jetzt auch das Militär, um die Impfung seiner Bevölkerung gegen die Schweinegrippe zu gewährleisten. Ab Mittwoch würden die landesweit gut 1100 Impfzentren durch "mehrere hundert" Militärärzte, Arbeitsmediziner und Medizinstudenten verstärkt, teilte das Präsidialamt am Montag in Paris mit. Laut Verteidigungsminister Hervé Morin kann die Armee binnen weniger Tage "zwischen 100 und 150 Impfteams" abstellen. Noch vor zwei Wochen habe sich niemand impfen lassen wollen, sagte der Minister im Sender France Inter. "Heute ist es genau umgekehrt."

THE FLU CASE

France to Mobilise 100-150 Military Vaccine Teams

The Flu Case, 30 November 2009 13:11
https://web.archive.org/web/20100102012949/http://theflucase.com/index.php?option=com_content&view=article&id=2126%3Afrance-to-mobilise-100-150-military-vaccine-teams&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French army is mobilising 100 to 150 "vaccination teams" to help vaccinate the population with the untested swine flu jab, the French Minister of Defence Herve Morin said on Monday.

From Wednesday, the 1,100 special "vaccine centers" in France will be operated by "several hundred" doctors belonging to the army medical corps as well as medical students.

Morin said more "vaccination teams" could be assembled from the military reserves.

President Nicolas Sarkozy, who called on his ministerial team to do more to get French vaccinated on Friday, called for the vaccine centers to be opened on Sunday.

Morin and Sarkozy claim that the unusual step of drafting in the army to administer the untested swine flu jab is needed because demand for the vaccine is rising, but the low turn out in France suggests demand is actually very low and possibly even falling in spite of intense pressure from the media and the government to get the jab.

Gendarmes were sent to close a school in Charente Maritime last week after the Mayor refused to obey an order from the Prefect on the grounds there was no evidence of a swine flu infections in the local school.

Many experts say that there will only be a more virulent virus if enough people are vaccinated.

THE FLU CASE

French Agency Prepared for Pandemic in January 2009

The Flu Case, 30 November 2009, 12:16

https://web.archive.org/web/20100102011926/http://theflucase.com/index.php?option=com_content&view=article&id=2123%3Afrench-agency-prepared-for-pandemic-in-january-2009&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French government agency responsible for dealing with pandemic emergencies began preparing for a pandemic in January – that is, three months before the allegedly new swine flu appeared in Mexico in April and one month before Baxter was found to have contaminated 72 kilos of vaccine material with the live bird flu virus, nearly sparking a global bird flu pandemic in February, according to a repot in Le Parisien. =>

http://www.leparisien.fr/saint-denis-93200/un-qg-pour-faire-face-aux-crises-sanitaires-16-01-2009-375348.php

The report dated January 16th, 2009 says that L'Eprus (Etablissement de préparation et de réponse aux urgences sanitaires) will need lots of motivation because the year 2009 "will be busy."

Founded in 2007, the agency for medical crisis moved "discretely" at the end of December to a larger 700m2 office in the Saint-Denis quarter of Paris.

French Health Minister Roselyne Bachelot visited the 30 or so staff belonging to the agency in the middle of January, around the same time as she requested an opinion from "legal experts" as to whether forced vaccination was possible in France and received the answer it was.

L'Eprus director Thierry Coudert told Le Parisien in January that the "song of 2009" is checking the quality and quantities of medicines, vaccines and masks in stock.

Furthermore, L'Eprus was looking for 1500 volunteers, ready to go into action immediately.

The preparedness of L'Eprus for a pandemic can be most simply explained by assuming they knew that Baxter, WHO, Bachelot and other entities planned to unleash one.

Another explanation might be they are able to see into the future thanks to miraculous powers of clairvoyance. However, while this explanation might be favoured by so-called conspiracy theorists, people who are concerned with building their opinions on the facts must conclude that L'Eprus had some type of inside knowlege of plans to trigger a pandemic in advance.

Le Parisien

Un QG pour faire face aux crises sanitaires

Le Parisien, 16 janvier 2009, à 07h00
https://www.leparisien.fr/seine-saint-denis-93/saint-denis-93200/un-qg-pour-faire-face-aux-crises-sanitaires-16-01-2009-375348.php

C'est un lieu hautement stratégique qui s'est discrètement installé fin décembre à Saint-Denis, à deux pas du Stade de France. Son nom: l'Eprus pour Etablissement de préparation et de réponse aux urgences sanitaires. Créée en 2007 et auparavant implantée à Paris (VI e), cette agence de 700 m 2 regroupe 31 salariés qui ont reçu hier matin la visite de la ministre de la Santé, Roselyne Bachelot. (photo). «Je suis ravie de voir enfin l'Eprus installée dans des locaux adaptés, avec une équipe motivée», s'est réjouie la ministre au terme d'un bref échange avec le personnel.

Pandémie, tsunami, attentats…

De la motivation, l'Eprus en aura besoin en cette année 2009 qui s'annonce chargée. «Notre rôle est de devenir une plaque tournante qui permettra de fournir les pouvoirs publics en moyens humains et matériels en cas de crise sanitaire grave ou de problèmes plus ponctuels», résume Thierry Coudert, directeur général de l'Eprus depuis octobre. Pandémie grippale, tsunami, attentats terroristes, dengue: le «pool de professionnels de la santé» de l'Eprus interviendra en cas de situations exceptionnelles impliquant un risque de désorganisation du système de soins en France et à l'étranger .

Selon Thierry Coudert, le «chantier de 2009» est de recenser et de vérifier la qualité des médicaments, vaccins et masques actuellement en stock (voir notre édition nationale d'hier). Mais aussi de recruter une «réserve sanitaire», un vivier de 1 500 volontaires mobilisables immédiatement (voir encadré), de couvrir juridiquement et servir d'agence de voyages. «L'idée est de réagir le plus vite possible aux sollicitations », insiste Thierry Coudert.

Par ailleurs, l'Eprus devrait acquérir cette année le statut d'établissement pharmaceutique qui lui permettra de stocker les médicaments sur différents sites tenus secrets en France, mais aussi de sous-traiter leur fabrication en cas de besoin. Lors des attaques terroristes de Bombay en décembre, l'Eprus a déjà envoyé une mission composée de cinq médecins, deux psychologues et deux convoyeurs. Elle pourrait intervenir très rapidement à Gaza, dans les territoires palestiniens, où un manque de chirurgiens a récemment été signalé.

https://web.archive.org/web/20100507155300/http://www.theatlantic.com/magazine/archive/2009/11/does-the-vaccine-matter/7723/3/

Whether this season's swine flu turns out to be deadly or mild, most experts agree that it's only a matter of time before we're hit by a truly devastating flu pandemic – one that might kill more people worldwide than have died of the plague and aids combined. In the U.S., the main lines of defense are pharmaceutical – vaccines and antiviral drugs to limit the spread of flu and prevent people from dying from it. Yet now some flu experts are challenging the medical orthodoxy and arguing that for those most in need of protection, flu shots and antiviral drugs may provide little to none. So where does that leave us if a bad pandemic strikes?

Drive too fast along Red Lion Road, beside Philadelphia's Northeast Airport, and you will miss the low-rise cement building where the biotech company MedImmune has been quietly pumping out swine flu vaccine at about a million doses a week. Through the summer and fall, workers wearing protective gear that covered them from head to toe brewed up batches of live, genetically modified flu virus. Robots then injected tiny doses of virus-laden fluid into glass vials, which were mounted into nasal spritzers, labeled, and readied for shipment at the direction of the Centers for Disease Control and Prevention, in Atlanta, which is helping to coordinate the nation's pandemic-preparedness plan. In the most ambitious vaccination program the nation has mounted since the anti-polio campaign in the 1950s, the federal government has commissioned MedImmune and four other companies to produce enough vaccine to cover the entire U.S. population.

Vaccination is central to the government's plan for preventing deaths from swine flu. The CDC has recommended that some 159 million adults and children receive either a swine flu shot or a dose of MedImmune's nasal vaccine this year. Shots are offered in doctors' offices, hospitals, airports, pharmacies, schools, polling places, shopping malls, and big-box stores like Wal-Mart. In August, New York state required all health-care workers to get both seasonal and swine flu shots. To further protect the populace, the federal government has spent upwards of $3billion stockpiling millions of doses of antiviral drugs like Tamiflu – which are being used both to prevent swine flu and to treat those who fall ill.

But what if everything we think we know about fighting influenza is wrong? What if flu vaccines do not protect people from dying – particularly the elderly, who account for 90 percent of deaths from seasonal flu? And what if the expensive antiviral drugs that the government has stockpiled over the past few years also have little, if any, power to reduce the number of people who die or are hospitalized? The U.S. government – with the support of leaders in the public-health and medical communities – has put its faith in the power of vaccines and antiviral drugs to limit the spread and lethality of swine flu. Other plans to contain the pandemic seem anemic by comparison. Yet some top flu researchers are deeply skeptical of both flu vaccines and antivirals. Like the engineers who

warned for years about the levees of New Orleans, these experts caution that our defenses may be flawed, and quite possibly useless against a truly lethal flu. And that unless we are willing to ask fundamental questions about the science behind flu vaccines and antiviral drugs, we could find ourselves, in a bad epidemic, as helpless as the citizens of New Orleans during Hurricane Katrina.

The term influenza, which dates back to the Middle Ages, is taken from the Italian word for occult or astral influence. Then as now, flu seemed to appear out of nowhere each winter, debilitating or killing large numbers of people, only to vanish in the spring. Today, seasonal flu is estimated to kill about 36,000 people in the United States each year, and half a million worldwide.

Yet the flu, in many important respects, remains mysterious. Determining how many deaths it really causes, or even who has it, is no simple matter. We think we have the flu anytime we fall ill with an ailment that brings on headache, malaise, fever, coughing, sneezing, and that achy feeling as if we've been sleeping on a bed of rocks, but researchers have found that at most half, and perhaps as few as 7 or 8 percent, of such cases are actually caused by an influenza virus in any given year. More than 200 known viruses and other pathogens can cause the suite of symptoms known as "influenza-like illness"; respiratory syncytial virus, bocavirus, coronavirus, and rhinovirus are just a few of the bugs that can make a person feel rotten. And depending on the season, in up to two-thirds of the cases of flu-like illness, no cause at all can be found.

Nobody knows precisely why we are much more likely to catch the flu in the winter months than at other times of the year. Perhaps it's because flu viruses flourish in cool temperatures and are killed by exposure to sunlight. Or maybe it's because in winter, people spend more time indoors, where a sneeze or a cough can more easily spread a virus to others. What is certain is that influenza viruses mutate with amazing speed, so each flu season sees slightly different genetic versions of the viruses that infected people the year before. Every year, the World Health Organization and the Centers for Disease Control and Prevention collect data from 94 nations on the flu viruses that circulated the previous year, and then make an educated guess about which viruses are likely to circulate in the coming fall. Based on that information, the U.S. Food and Drug Administration issues orders to manufacturers in February for a vaccine that includes the three most likely strains.

Every once in a while, however, a very different bug pops up and infects far more people than the normal seasonal flu variants do. It is these novel viruses that are responsible for pandemics, defined by the World Health Organization as events that occur when "a new influenza virus appears against which the human population has no immunity" and which can sweep around the world in a very short time. The worst flu pandemic in recorded history was the "Spanish flu" of 1918–19, at the end of World WarI. A third of the world's population was infected, with at least 40million and perhaps as many as 100million people dying – more than were killed in World Wars I and II combined. (Some scholars suggest that one reason World WarI ended was that so many soldiers were sick or dying from flu.) Since then, two other flu pandemics have occurred, in 1957 and 1968, neither of which was particularly lethal.

In August, the President's Council of Advisors on Science and Technology projected that this fall and winter, the swine flu, H1N1, could infect anywhere between one-third and one-half of the U.S. population and could kill as many as 90,000 Americans, two and a half times the number killed in a typical flu season. But precisely how deadly, or even how infectious, this year's H1N1 pandemic will turn out to be won't be known until it's over. Most reports coming from the Southern Hemisphere in late August (the end of winter there) suggested that the swine flu is highly infectious, but not particularly lethal. For example, Australian officials estimated they would finish winter with under 1,000 swine flu deaths – fewer than the usual 1,500 to 3,000 from seasonal flu. Among those who have died in the U.S., about 70 percent were already suffering from congenital conditions like cerebral palsy or underlying illnesses such as cancer, asthma, or AIDS, which make people more vulnerable.

Public-health officials consider vaccine their most formidable defense against the pandemic – indeed, against any flu – and on the surface, their faith seems justified. Vaccines developed over the course of the 20th century slashed the death rates of nearly a dozen infectious diseases, such as smallpox and polio, and vaccination became one of medicine’s most potent weapons. Influenza virus was first identified in the 1930s, and by the mid-1940s, researchers had produced a vaccine that was given to soldiers in World WarII. The U.S. government got serious about promoting flu vaccine after the 1957 flu pandemic brought home influenza’s continuing potential to cause widespread illness and death. Today, flu vaccine is a staple of public-health policy; in a normal year, some 100 million Americans get vaccinated.

But while vaccines for, say, whooping cough and polio clearly and dramatically reduced death rates from those diseases, the impact of flu vaccine has been harder to determine. Flu comes and goes with the seasons, and often it does not kill people directly, but rather contributes to death by making the body more susceptible to secondary infections like pneumonia or bronchitis. For this reason, researchers studying the impact of flu vaccination typically look at deaths from all causes during flu season, and compare the vaccinated and unvaccinated populations.

Such comparisons have shown a dramatic difference in mortality between these two groups: study after study has found that people who get a flu shot in the fall are about half as likely to die that winter – from any cause – as people who do not. Get your flu shot each year, the literature suggests, and you will dramatically reduce your chance of dying during flu season.

Yet in the view of several vaccine skeptics, this claim is suspicious on its face. Influenza causes only a small minority of all deaths in the U.S., even among senior citizens, and even after adding in the deaths to which flu might have contributed indirectly. When researchers from the National Institute of Allergy and Infectious Diseases included all deaths from illnesses that flu aggravates, like lung disease or chronic heart failure, they found that flu accounts for, at most, 10 percent of winter deaths among the elderly. So how could flu vaccine possibly reduce total deaths by half? Tom Jefferson, a physician based in Rome and the head of the Vaccines Field at the Cochrane Collaboration, a highly respected international network of researchers who appraise medical evidence, says: "For a vaccine to reduce mortality by 50 percent and up to 90 percent in some studies means it has to prevent deaths not just from influenza, but also from falls, fires, heart disease, strokes, and car accidents. That’s not a vaccine, that’s a miracle.”

The estimate of 50 percent mortality reduction is based on "cohort studies,” which compare death rates in large groups, or cohorts, of people who choose to be vaccinated, against death rates in groups who don’t. But people who choose to be vaccinated may differ in many important respects from people who go unvaccinated – and those differences can influence the chance of death during flu season. Education, lifestyle, income, and many other "confounding” factors can come into play, and as a result, cohort studies are notoriously prone to bias. When researchers crunch the numbers, they typically try to factor out variables that could bias the results, but, as Jefferson remarks, "you can adjust for the confounders you know about, not for the ones you don’t,” and researchers can’t always anticipate what factors are likely to be important to whether a patient dies from flu. There is always the chance that they might miss some critical confounder that renders their results entirely wrong.

When **Lisa Jackson**, a physician and senior investigator with the Group Health Research Center, in Seattle, began wondering aloud to colleagues if maybe something was amiss with the estimate of 50 percent mortality reduction for people who get flu vaccine, the response she got sounded more like doctrine than science. "People told me, ‘No good can come of [asking] this’,” she says. "‘Potentially a lot of bad could happen’ for me professionally by raising any criticism that might dissuade people from getting vaccinated, because of course, ‘We know that vaccine works.’ This was the prevailing wisdom.”

Nonetheless, in 2004, Jackson and three colleagues set out to determine whether the mortality difference between the vaccinated and the unvaccinated might be caused by a phenomenon known as the "healthy user effect." They hypothesized that on average, people who get vaccinated are simply healthier than those who don't, and thus less liable to die over the short term. People who don't get vaccinated may be bedridden or otherwise too sick to go get a shot. They may also be more likely to succumb to flu or any other illness, because they are generally older and sicker. To test their thesis, Jackson and her colleagues combed through eight years of medical data on more than 72,000 people 65 and older. They looked at who got flu shots and who didn't. Then they examined which group's members were more likely to die of any cause when it was *not* flu season.

Jackson's findings showed that *outside of flu season*, the baseline risk of death among people who did not get vaccinated was approximately 60 percent higher than among those who did, lending support to the hypothesis that on average, healthy people chose to get the vaccine, while the "frail elderly" didn't or couldn't. In fact, the healthy-user effect explained the entire benefit that other researchers were attributing to flu vaccine, suggesting that the vaccine itself might not reduce mortality at all. Jackson's papers "are beautiful," says Lone Simonsen, who is a professor of global health at George Washington University, in Washington, D.C., and an internationally recognized expert in influenza and vaccine epidemiology. "They are classic studies in epidemiology, they are so carefully done."

The results were also so unexpected that many experts simply refused to believe them. Jackson's papers were turned down for publication in the top-ranked medical journals. One flu expert who reviewed her studies for the *Journal of the American Medical Association* wrote, "To accept these results would be to say that the earth is flat!" When the papers were finally published in 2006, in the less prominent *International Journal of Epidemiology*, they were largely ignored by doctors and public-health officials. "The answer I got," says Jackson, "was not the right answer."

=> Jackson LA, et al. Functional status is a confounder of the association of influenza vaccine and risk of all cause mortality in seniors. Int J Epidemiol. 2006 Apr; 35(2): 345-52. Epub 2005 Dec 20. Doi: 10.1093/ije/dyi275.

=> Jackson LA, et al. Evidence of bias in estimates of influenza vaccine effectiveness in seniors. Int J Epidemiol. 2006 Apr;35(2):337-44. Epub 2005 Dec 20. PMID: 16368725; doi: 10.1093/ije/dyi274.

The history of flu vaccination suggests other reasons to doubt claims that it dramatically reduces mortality. In 2004, for example, vaccine production fell behind, causing a 40 percent drop in immunization rates. Yet mortality did not rise. In addition, vaccine "mismatches" occurred in 1968 and 1997: in both years, the vaccine that had been produced in the summer protected against one set of viruses, but come winter, a different set was circulating. In effect, nobody was vaccinated. Yet death rates from all causes, including flu and the various illnesses it can exacerbate, did not budge.

Sumit Majumdar, a physician and researcher at the University of Alberta, in Canada, offers another historical observation: rising rates of vaccination of the elderly over the past two decades have not coincided with a lower overall mortality rate. In *1989, only 15 percent of people* over age 65 in the U.S. and Canada were vaccinated against flu. *Today, more than 65 percent* are immunized. Yet death rates among the elderly during flu season *have increased* rather than decreased.

Vaccine proponents call Majumdar's last observation an "ecological fallacy," because he fails, in their view, to consider changes in the larger environment that could have boosted death rates over the years – even as rising vaccination rates were doing their part to keep mortality in check. The proponents suggest, for instance, that influenza viruses may have become more contagious over time, and thus are infecting greater numbers of elderly people, including some who have been vaccinated. Or maybe the viruses are becoming more lethal. Or maybe the elderly have less immunity to flu than they once did because, say, their diets have changed.

=> Eurich DT, ... Majumdar SR. Mortality reduction with influenza vaccine in patients with pneumonia outside "flu" season: pleiotropic benefits or residual confounding? doi: 10.1164/rccm.200802-282OC

Or maybe vaccine just doesn't prevent deaths in the elderly. Of course, that's the one possibility that vaccine adherents won't consider. **Nancy Cox**, the CDC's influenza division chief, says flatly, "*The flu vaccine is the best way to protect against flu*."

Anthony Fauci, a physician and the director of the National Institute of Allergy and Infectious Diseases at the NIH, where much of the basic science of flu vaccine has been worked out, says, "*I have no doubt that it is effective in conferring some degree of protection. To say otherwise is a minority view*."

Majumdar says, "We keep coming up against the belief that we've reduced mortality by 50 percent," and when researchers poke holes in the evidence, "people pound the pulpit."

The most vocal – and undoubtedly most vexing – critic of the gospel of flu vaccine is the Cochrane Collaboration's Jefferson, who's also an epidemiologist trained at the famed London School of Tropical Hygiene, and who, in Lisa Jackson's view, makes other skeptics seem "moderate by comparison." Among his fellow flu researchers, Jefferson's outspokenness has made him something of a pariah. At a 2007 meeting on pandemic preparedness at a hotel in Bethesda, Maryland, Jefferson, who'd been invited to speak at the conference, was not greeted by any of the colleagues milling about the lobby. He ate his meals in the hotel restaurant alone, surrounded by scientists chatting amiably at other tables. He shrugs off such treatment. As a medical officer working for the United Nations in 1992, during the siege of Sarajevo, he and other peacekeepers were captured and held for more than a month by militiamen brandishing AK-47s and reeking of alcohol. Professional shunning seems trivial by comparison, he says.

"**Tom Jefferson** has taken a lot of heat just for saying, '*Here's the evidence: it's not very good*,'" says Majumdar. "The reaction has been so dogmatic and even hysterical that you'd think he was advocating stealing babies." Yet while other flu researchers may not like what Jefferson has to say, they cannot ignore the fact that he knows the flu-vaccine literature better than anyone else on the planet. He leads an international team of researchers who have combed through hundreds of flu-vaccine studies. The vast majority of the studies were deeply flawed, says Jefferson. "*Rubbish is not a scientific term, but I think it's the term that applies*." Only four studies were properly designed to pin down the effectiveness of flu vaccine, he says, and two of those showed that it might be effective in certain groups of patients, such as school-age children with no underlying health issues like asthma. The other two showed equivocal results or no benefit.

Flu researchers have been fooled into thinking vaccine is more effective than the data suggest, in part, says Jefferson, by the imprecision of the statistics. The only way to know if someone has the flu – as opposed to influenza-like illness – is by putting a Q-tip into the patient's throat or nose and running a test, which simply isn't done that often. Likewise, nobody really has a handle on how many of the deaths that are blamed on flu were actually caused by a flu virus, because few are confirmed by a laboratory. "I used to be a family physician," says Jefferson. "I've never seen a patient come to my office with *H1N1* written on his forehead. When an old person dies of respiratory failure after an influenza-like illness, they nearly always get coded as influenza."

There's one other way flu researchers may be fooled into thinking flu vaccine is effective, Jefferson says. All vaccines work by delivering a dose of killed or weakened virus or bacteria, which provokes the immune system into producing antibodies. When the person is subsequently exposed to the real thing, the body is already prepared to repel the bug completely or to get rid of it after a mild illness. Flu researchers often use antibody response as a way of gauging the effectiveness of vaccine, on the assumption that levels of antibodies in the blood of people who have been vaccinated are a good predictor – although an imperfect one – of how well they can ward off the infection.

There's some merit to this reasoning. Unfortunately, the very people who most need protection from the flu also have immune systems that are least likely to respond to vaccine. Studies show that young, healthy people mount a glorious immune response to seasonal flu vaccine, and their response reduces their chances of getting the flu and may lessen the severity of symptoms if they do get it. But they aren't the people who die from seasonal flu. By contrast, *the elderly, particularly those over age70, don't have a good immune response to vaccine* – and they're the ones who account for most flu deaths. (Infants with severe disabilities, such as leukemia and congenital lung disease, and

people who are immune-compromised – from AIDS, or diabetes, or cancer treatment – make up the rest. As of August 8, only 36 deaths from swine flu had been confirmed among children in the U.S., and the overwhelming majority of those children had multiple, severe health disorders.)

In Jefferson's view, this raises a troubling conundrum: *Is vaccine necessary for those in whom it is effective, namely the young and healthy? Conversely, is it effective in those for whom it seems to be necessary, namely the old, the very young, and the infirm*? These questions have led to the most controversial aspect of Jefferson's work: his call for placebo-controlled trials, studies that would randomly give half the test subjects vaccine and the other half a dummy shot, or placebo. Only such large, well-constructed, randomized trials can show with any precision how effective vaccine really is, and for whom.

In the flu-vaccine world, Jefferson's call for placebo-controlled studies is considered so radical that even some of his fellow skeptics oppose it. Majumdar, the Ottawa researcher, says he believes that evidence of a benefit among children is established and that public-health officials should try to protect seniors by immunizing children, health-care workers, and other people around them, and thus reduce the spread of the flu. Lone Simonsen explains the prevailing view: "It is considered unethical to do trials in populations that are recommended to have vaccine," a stance that is shared by everybody from the CDC's Nancy Cox to Anthony Fauci at the NIH. They feel strongly that vaccine has been shown to be effective and that a sham vaccine would put test subjects at unnecessary risk of getting a serious case of the flu. In a phone interview, Fauci at first voiced the opinion that a placebo trial in the elderly might be acceptable, but he called back later to retract his comment, saying that such a trial "would be unethical." Jefferson finds this view almost exactly backward: "What do you do when you have uncertainty? You test," he says. "We have built huge, population-based policies on the flimsiest of scientific evidence. The most unethical thing to do is to carry on business as usual."

Just after 6 p.m. on a warm Friday evening in July, Dr. David Newman is only minutes into a 10-hour shift in the emergency room of New York City's St. Luke's Hospital, and already he has assumed responsibility for 11 patients. The young Italian tourist sitting on the bed in front of the doctor has meningitis, and through an interpreter, Newman tells him he almost certainly has the viral form of the disease, which will do nothing more than make him feel ill for a few days. There is a tiny chance, says Newman, that the illness is caused by a bacterium, which can be deadly, but he is almost positive that's not what the tourist has. He says to his patient, "I can't tell you with 100 percent certainty that you don't have it, but if you do, you'll begin to feel worse and you'll need to come back." The tourist, on learning that he might be infected with a potentially lethal disease, looks down at his feet and confesses that he is much more worried about another illness: swine flu. Newman smiles patiently. "It would be nice if you had swine flu," he says. "Compared to bacterial meningitis, swine flu is safe."

Late last spring, as headlines and airwaves warned of a possible pandemic, patients like Newman's began clogging emergency rooms across the country, a sneezing, coughing, infectious tide of humanity more worried than truly sick, but whose mere presence in the emergency room has endangered the lives of others. "*Studies show that when there is ER crowding, mortality goes up, because patients who need immediate attention don't get it*," says Newman, the director of clinical research in the Department of Emergency Medicine at the hospital, which is affiliated with Columbia University. In an average year the ER at St. Luke's, a sprawling 1,076-bed hospital on 113th Street, takes in 110,000 patients, some 300 a day. At the height of the summer swine flu outbreak, that number doubled. The vast majority of panicky patients who came in the door at St. Luke's and other emergency departments didn't actually have the virus, and of those who did, most were not sick enough to need hospitalization. Even so, says Newman, when patients with even mild flu symptoms show up in the hospital, they vastly increase the spread of the virus, simply because they inevitably sneeze and cough in rooms that are jammed with other people.

Many of the worried sick come to St. Luke's and other hospitals in search of antiviral drugs. The CDC recommends the use of two drugs against H1N1: oseltamivir and zanamivir, better known by

their brand names, Tamiflu and Relenza, which together form the second pillar of the government's anti-pandemic-flu strategy. Public-health officials at the state and local levels are also recommending the drugs. Guidelines issued by the New York City Department of Health, says Newman, "encourage us to give a prescription to just about every patient with the sniffles," a practice that some experts worry will quickly lead to resistant strains of the virus.

Indeed, that's already happening. Daniel Janies, an associate professor of biomedical informatics at Ohio State University, tracks the genetic mutations that allow flu virus to develop resistance to drugs. Flu can become resistant to Tamiflu in a matter of days, he says. Handing out the drug early in the pandemic, when H1N1 poses only a minimal threat to the vast majority of patients, strikes him as "shortsighted." Indeed, samples of resistant H1N1 were cropping up by midsummer, increasing the likelihood that come late fall, many people will be infected with a resistant strain of swine flu. Alarmed at that prospect, the World Health Organization issued an alert on August 21, recommending that *Tamiflu and Relenza be used only in severe cases and in patients* who are at high risk of serious complications. By mid-August, two U.S. swine flu patients had developed Tamiflu-resistant strains.

The U.S. first began stockpiling Tamiflu and Relenza back in 2005, in the wake of concern that an outbreak in Southeast Asia of bird flu, a far more deadly form of the disease, might go global. On November 1, 2005, President George W.Bush pronounced pandemic flu a "danger to our homeland," and he asked Congress to approve legislation that included $1 billion for the production and stockpiling of antivirals. This was after Congress had already approved $1.8 billion to stockpile Tamiflu for the military, a decision that was made during the tenure of Defense Secretary Donald Rumsfeld. (Before joining the Bush Cabinet, Rumsfeld was chairman for four years of Gilead Sciences, the company that holds the patent on Tamiflu, and he held millions of dollars' worth of stock in the company. According to *Roll Call*, an online newspaper covering events on Capitol Hill, Rumsfeld says he recused himself from all government decisions involving Tamiflu. Gilead's stock price rose more than 50 percent in 2005, when the government's plan was announced.)

As with vaccines, the scientific evidence for Tamiflu and Relenza is thin at best. In its general-information section, the CDC's Web site tells readers that antiviral drugs can "make you feel better faster." True, but not by much. On average, Tamiflu (which accounts for 85 to 90 percent of the flu antiviral-drug market) cuts the duration of flu symptoms by 24 hours in otherwise healthy people. In exchange for a slightly shorter bout of illness, as many as one in five people taking Tamiflu will experience nausea and vomiting. About one in five children will have neuropsychiatric side effects, possibly including anxiety and suicidal behavior. In Japan, where Tamiflu is liberally prescribed, the drug may have been responsible for 50 deaths from cardiopulmonary arrest, from 2001 to 2007, according to Rokuro Hama, the chair of the Japan Institute of Pharmacovigilance.

Such side effects might be worth risking if the antivirals prevented serious complications of flu, such as pneumonia, hospitalization, and death. Roche Laboratories, the company licensed to manufacture and market Tamiflu, says its drug does just that. In two September 2006 press releases, the company announced, "Tamiflu significantly reduces the risk of death from influenza: New data shows treatment was associated with more than a two third reduction in deaths," and "Children with influenza [are] 53 percent less likely to contract pneumonia when treated with Tamiflu." Once again cohort studies (the same kind of potentially biased research that led to the conclusion that flu vaccine cuts mortality by 50 percent) are behind these claims. Tamiflu costs $10 a pill. It is possible that people who take it are more likely to be insured and affluent, or at least middle-class, than those who do not, and a large body of evidence shows that the well-off nearly always fare better than the poor when stricken with an infectious disease, including flu. In both 2003 and 2009, reviews of randomized placebo-controlled studies found that *the study populations simply weren't large enough to answer the question*: Does Tamiflu prevent pneumonia?

As late as this August, the company's own Web site contained the following statement, which was written under the direction of the FDA: "*Tamiflu has not been proven to have a positive impact*

on the potential consequences (such as hospitalizations, mortality, or economic impact) of seasonal, avian, or pandemic influenza." An FDA spokesperson said recently that the agency is unaware of any data submitted by Roche that would support the claims in the company's September 2006 news release about the drug's reducing flu deaths.

Why, then, has the federal government stockpiled millions of doses of antivirals, at a cost of several billion dollars? And why are physicians being encouraged to hand out prescriptions to large numbers of people, without sound evidence that the drugs will help? The short answer may be that public-health officials feel they must offer something, and these drugs are the only possible remedies at hand. "I have to agree with the critics the antiviral question is not cut-and-dried," says Fauci. "But [these drugs are] the best we have." The CDC's Nancy Cox also acknowledges that the *science is not as sound as she might like, but the government still recommends their use*. And as with vaccines, she considers additional randomized placebo-controlled trials of the antiviral drugs to be "unethical" and thus out of the question.

This is the curious state of debate about the government's two main weapons in the fight against pandemic flu. At first, government officials declare that both vaccines and drugs are effective. When faced with contrary evidence, the adherents *acknowledge that the science is not as crisp as they might wish*. Then, in response to calls for placebo-controlled trials, which would provide clear results one way or the other, the proponents say such studies would deprive patients of vaccines and drugs that have already been deemed effective. "We can't just let people die," says Cox.

Students of U.S. medical history will find this circular logic familiar: it is a long-recurring theme in American medicine, and one that has, on occasion, had deadly consequences. In 1925, Sinclair Lewis caricatured a medical culture that allowed belief – and profits – to distort science in his Pulitzer Prize–winning book, *Arrowsmith*. Based on the lives of the real-life microbiologists Paul de Kruif and Jacques Loeb, Lewis tells the story of Martin Arrowsmith, a physician who invents a new vaccine during a deadly outbreak of bubonic plague. But his efforts to test the vaccine's efficacy are frustrated by an angry community that desperately wants to believe the vaccine works, and a profit-hungry institute that rushes the vaccine into use prematurely – forever preempting the proper studies that are needed.

The annals of medicine are littered with treatments and tests that became medical doctrine on the slimmest of evidence, and were then declared sacrosanct and beyond scientific investigation. In the 1980s and '90s, for example, cancer specialists were convinced that high-dose chemotherapy followed by a bone-marrow transplant was the best hope for women with advanced breast cancer, and many refused to enroll their patients in randomized clinical trials that were designed to test transplants against the standard – and far less toxic – therapy. The trials, they said, were unethical, because they *knew* transplants worked. When the studies were concluded, in 1999 and 2000, *it turned out that bone-marrow transplants were killing patients*. Another recent example involves drugs related to the analgesic lidocaine. In the 1970s, doctors noticed that the drugs seemed to make the heart beat rhythmically, and they began prescribing them to patients suffering from irregular heartbeats, assuming that restoring a proper rhythm would reduce the patient's risk of dying. Prominent cardiologists for years opposed clinical trials of the drugs, saying it would be medical malpractice to withhold them from patients in a control group. The drugs were widely used for two decades, until a government-sponsored study showed in 1989 that *patients who were prescribed the medicine were three and a half times as likely to die as those given a placebo*.

Demonstrating the efficacy (or lack thereof) of vaccine and antivirals during flu season would not be hard to do, given the proper resources. Take a group of people who are at risk of getting the flu, and randomly assign half to get vaccine and the other half a dummy shot. Then count the people in each group who come down with flu, suffer serious illness, or die. (A similarly designed trial would suffice for the antivirals.) It might sound coldhearted, but it is the only way to know for certain whether, and for whom, current remedies actually work. It would also be useful to know whether vaccinating healthy people – who can mount an immune response on their own – protects

the more vulnerable people around them. For example, immunizing nursing-home staff and healthy children is thought to reduce the spread of flu to the elderly and the immune-compromised. Pinning down the effectiveness of this strategy would be a bit more complex, but not impossible.

In the absence of such evidence, we are left with two possibilities. One is that flu vaccine is in fact highly beneficial, or at least helpful. Solid evidence to that effect would encourage more citizens – and particularly more health professionals – to get their shots and prevent the flu's spread. As it stands, more than 50 percent of health-care workers say they do not intend to get vaccinated for swine flu and don't routinely get their shots for seasonal flu, in part because many of them doubt the vaccines' efficacy. The other possibility, of course, is that we're relying heavily on vaccines and antivirals that simply don't work, or don't work as well as we believe. And as a result, we may be neglecting other, proven measures that could minimize the death rate during pandemics.

"***Vaccines give us a false sense of security***," says Sumit Majumdar. "When you have a strategy that [everybody thinks] reduces death by 50 percent, it's pretty hard to invest resources to come up with better remedies." For instance, health departments in every state are responsible for submitting plans to the CDC for educating the public, in the event of a serious pandemic, about hand-washing and "social distancing" (voluntary quarantines, school closings, and even enforcement of mandatory quarantines to keep infected people in their homes). Putting these plans into action will require considerable coordination among government officials, the media, and health-care workers – and widespread buy-in from the public. Yet little discussion has appeared in the press to help people understand the measures they can take to best protect themselves during a flu outbreak – other than vaccination and antivirals.

"Launched early enough and continued long enough, social distancing can blunt the impact of a pandemic," says Howard Markel, a pediatrician and historian of medicine at the University of Michigan. Washing hands diligently, avoiding public places during an outbreak, and having a supply of canned goods and water on hand are sound defenses, he says. Such steps could be highly effective in helping to slow the spread of the virus. In Mexico, for instance, where the first swine flu cases were identified in March, the government launched an aggressive program to get people to wash their hands and exhorted those who were sick to stay home and effectively quarantine themselves. In the United Kingdom, the national health department is promoting a "buddy" program, encouraging citizens to find a friend or neighbor willing to deliver food and medicine so people who fall ill can stay home.

In the U.S., by contrast, our reliance on vaccination may have the opposite effect: breeding feelings of invulnerability, and leading some people to ignore simple measures like better-than-normal hygiene, staying away from those who are sick, and staying home when they feel ill. Likewise, our encouragement of early treatment with antiviral drugs will likely lead many people to show up at the hospital at first sniffle. "***There's no worse place to go than the hospital during flu season***," says Majumdar. Those who don't have the flu are more likely to catch it there, and those who do will spread it around, he says. "But we don't tell people this."

All of which leaves open the question of what people should do when faced with a decision about whether to get themselves and their families vaccinated. There is little immediate danger from getting a seasonal flu shot, aside from a sore arm and mild flu-like symptoms. The safety of the swine flu vaccine remains to be seen. In the absence of better evidence, vaccines and antivirals must be viewed as only partial and uncertain defenses against the flu. And they may be mere talismans. By being afraid to do the proper studies now, we may be condemning ourselves to using treatments based on illusion and faith rather than sound science.

Access to H1N1 Vaccine Easing as Interest in Shot Wanes

Fox News, 1 December 2009
https://web.archive.org/web/20091204002311/http://www.foxnews.com/story/0,2933,578369,00.html

With 66 million doses of H1N1 vaccine now available in the U.S., municipalities have begun easing restrictions to access, and federal officials believe the vaccine may soon be available to all.

Starting Tuesday, the Tennessee counties of Memphis and Shelby will begin administering H1N1 vaccine to everyone who wants it, joining several other municipalities across the country that have already opened access or are considering doing so.

"I get the sense that more areas are starting to vaccinate outside the priority groups," said Tom Skinner, a spokesman for the U.S. Centers for Disease Control and Prevention.

Skinner said federal officials have been clear in their desire to have priority groups, such as pregnant women and children, vaccinated first.

"But federal guidelines also give states the flexibility to vaccinate outside the priority groups if the states feel that's the best thing to do given the issues surrounding supply and demand at the local level," Skinner said.

States are in the best position to make the call to open the vaccine to everyone, Skinner said, adding that more states will be vaccinating outside the priority groups in the coming weeks and months as more of it becomes available.

"There will come a time when everyone will have access to it," he said.

The H1N1 vaccine became available in the U.S. in early October, about a month after schools and colleges opened. By mid-month, 14 million doses of the vaccine were available, about half of what the U.S. expected to have received from manufacturers.

A top Dallas County (Texas) health official on Saturday called for distribution of the H1N1 vaccine to everyone, as more vaccine appears to be headed toward North Texas pharmacies.

The move comes as interest in obtaining the shot by high-risk groups appears to be waning.

Zachary Thompson, director of Dallas County Health and Human Services, told the Dallas Morning News he was concerned that the vaccine supply already shared with local pharmacies had not found enough takers among the targeted high-risk groups.

A spot check of local pharmacies by The Dallas Morning News last week found that some stores still had hundreds of shots available for people in high-risk groups.

In addition to local pharmacies, chain drugstores including Walgreens and CVS are offering the vaccines in Dallas County.

Walgreens, which is distributing vaccine in 25-30 states, is complying with federal guidelines and immunizing only high-risk groups against the virus, said spokesman Jim Cohn. He said the company would be willing to offer the vaccinations to everyone if that were the directive of the municipal health department.

"We work on a state-by-state and county-by-county basis," he said. "In some cases, we're sitting and waiting for the vaccine. In other cases, the (municipal) government came to us early on and asked us to be part of the supply chain so that the vaccine could be distributed as efficiently as possible. We would like to be able to receive and offer vaccine in all 50 states and it is becoming more widely available as time goes on."

Despite reports of an H1N1 virus mutation in Norway, a federal health official said Tuesday that the H1N1 vaccine is well-matched and still a person's best defense against the virus.

"We have not seen clusters of resistance," said Dr. Thomas Frieden, director of the U.S. Centers for Disease Control and Prevention. "The cases reported are interesting, but they are not of concern."

Frieden said the H1N1 virus is gradually decreasing in the United States, but is still widespread in 32 states and people should remain vigilant.

"Although the flu is going down," Frieden said, "it's far from gone. … And flu season lasts until May so there's still a lot of time to see what will happen."

The CDC polled 12 health experts who were split as to whether the country will see another surge of H1N1 this flu season.

"One (expert) said flip a coin," Frieden said. "We don't know what the future will hold. ... What we do know is that the vaccine is the very best way to protect yourself."

Frankfurter Allgemeine

"Ängste normalisiert":
Sinkende Nachfrage nach Schweinegrippe-Impfstoff

Frant'furter Algemeine, 1 Dezembre 2009, 15:10
https://www.faz.net/aktuell/rhein-main/hessen/aengste-normalisiert-sinkende-nachfrage-nach-schweinegrippe-impfstoff-1900854.html

Die Zahl der an Schweinegrippe Infizierten in Hessen ist auf mehr als 7500 Fälle "stark angestiegen". Gleichwohl lässt der Ansturm auf die Impfungen nach. "Die Ängste haben sich normalisiert", heißt es bei der Kassenärztlichen Vereinigung Hessen.

Der Ansturm auf Impfungen gegen Schweinegrippe ebbt ab. 781.000 Impfstoffdosen hat das hessische Gesundheitsministerium bislang erhalten und an Ärzte verteilt. Im Moment gebe es keine Engpässe bei den Bestellungen, sagte eine Sprecherin in Wiesbaden. Grund sei die sinkende Nachfrage. Dies bestätigte auch die Kassenärztliche Vereinigung (KV) Hessen: "Die Ängste haben sich normalisiert", sagte eine Sprecherin. So langsam, wie die Impfaktion angelaufen sei, gehe es aktuell weiter.

Nach KV-Angaben ist die Zahl der an Schweinegrippe Infizierten in Hessen auf mehr als 7500 Fälle "stark angestiegen". Trotz steigender Infektionszahlen erschreckt die Schweinegrippe in Hessen niemanden mehr so richtig. "Die Ängste haben sich normalisiert", sagte eine Sprecherin der Kassenärztlichen Vereinigung (KV) Hessen in Frankfurt der Deutschen Presse-Agentur. Ebenso langsam, wie die Impfaktion angelaufen sei, gehe es derzeit weiter: "Von Impfmüdigkeit kann gar keine Rede sein - es gab ja nicht mal eine Impfbegeisterung."

Wieder mit steigender Nachfrage zu rechnen

"Die Nachfrage ist abgeflaut", bestätigt auch die Sprecherin des Gesundheitsministeriums. Derzeit gebe es keine Engpässe bei den Impfstoffbestellungen. "Aber noch letzte Woche konnten nicht alle Bestellungen erfüllt werden." Es sei auch wieder mit steigender Nachfrage zu rechnen, da die Ständige Impfkommission in den kommenden Tagen bundesweit eine Empfehlung veröffentlichen werde, vor allem Kinder impfen zu lassen. Dies gelte auch für nicht chronisch vorerkrankte Kinder.

Gut 1,5 Millionen Impfstoff-Dosen sollen bis Ende Dezember geliefert werden, insgesamt 3,7 Millionen bis zum nächsten Frühjahr. Seit Anfang der Woche kann nach Beschluss des Ministeriums der Schweinegrippe-Impfstoff nur noch per Rezept bei den Lieferapotheken bestellt werden. "Das ist aber ein rein formaler Akt und ändert nichts an den Beschaffungsmöglichkeiten oder der -geschwindigkeit", erklärte die Sprecherin der Kassenärztlichen Vereinigung Hessen.

THE FLU CASE

Germans taking Swine Flu jab drops to new Lows

The Flu Case, 2 December 2009 13:03
https://web.archive.org/web/20100102022440/http://theflucase.com/index.php?option=com_content&view=article&id=2158%3Agermans-taking-swine-flu-jab-drops-to-new-lows&catid=1%3Alatest-news&Itemid=64&lang=en

The number of Germans going to take their swine flu jabs has dropped dramatically again in spite of intense scare mongering about the pandemic in the media, according to reports in the dpp.

Heinz Fracke, the head of Thuringia's Health Ministry, said on Tuesday that there had been a "considerable ebbing away" in the "vaccination joy", but refused to give any figures.

A spokesperson from the Frankfurt am Main health authorities was more frank when she told the FAZ: "There can be no talk about vaccine tiredness - there was never any vaccine enthusiasm in the first place."

Berliner Morgenpost

Christine Richter

Schweinegrippe-Impfung nun auch für Gesunde

Berliner Morgenpost, 1 Dezember 2009, 14:20 Uhr
https://www.morgenpost.de/berlin/article104924688/Schweinegrippe-Impfung-nun-auch-fuer-Gesunde.html

Zuerst waren die Risikogruppen an der Reihe, nun kann sich jeder Berliner gegen Schweinegrippe impfen lassen. Die Gesundheitssenatorin wird am Donnerstag zu den Ersten gehören, die in eine der 716 Berliner Arztpraxen, die impfen, zur Immunisierung geht.

Rund vier Wochen nach dem Start der Impfaktion gegen Schweingrippe können sich nun auch Gesunde gegen das Virus immunisieren lassen. Voraussichtlich an diesem Mittwoch werde die Ständige Impfkommission (STIKO) die Schutzimpfung auch Menschen ohne Gesundheitsprobleme empfehlen, teilte die Senatsgesundheitsverwaltung mit. Senatorin Katrin Lompscher (Linke) geht mit gutem Beispiel voran und will sich am Donnerstagmorgen immunisieren lassen. Sie rät auch gesunden Berlinern zur Impfung. "Wer sich impfen lässt, schützt sich und andere", sagte sie.

Bisher wurde die Impfung nur medizinischem Personal, Polizei, Feuerwehr und chronisch Kranken empfohlen, darunter auch chronisch kranken Kindern. In Berlin haben inzwischen 716 Arztpraxen den Impfstoff vorrätig. Die Adressen stehen im Internet unter www.berlin.de/impfen. In der vergangenen Woche waren die Ansteckungszahlen um mehr als 1500 nach oben geschnellt. Inzwischen sind seit Mitte Juni mehr als 5000 Schweinegrippe-Fälle in der Hauptstadt bestätigt.

Das Robert Koch-Institut (RKI) gibt bei der Schweinegrippe noch keine Entwarnung. Die Zahl der Atemwegserkrankungen als Signal für die Neue Grippe steige bundesweit weiter an. Nur in Bayern seien die Atemwegserkrankungen in den vergangenen zwei Wochen leicht zurückgegangen. Sie könnten in den kommenden Wochen aber auch wieder steigen: Es wird kälter – und der Winter als traditionelle Grippezeit steht erst noch bevor.

GENTSIDE

Grippe A: pas de vaccination pour les médecins généralistes

Maxisciences, 1 décembre 2009, à 11:37
https://www.maxisciences.com/sante/grippe-a-pas-de-vaccination-pour-les-medecins-generalistes_art4692.html

France – La ministre de la Santé a annoncé que les médecins généralistes ne seront pas habilités à vacciner contre la grippe A jusqu'à nouvel ordre. Roselyne Bachelot préfère les voir soigner que vacciner.

Il y a environ dix jours, Roselyne Bachelot avait annoncé que certains cabinets médicaux seraient habilités de façon ciblée à vacciner au mois de décembre.

Aujourd'hui, la ministre a annoncé vouloir "*préserver la capacité des médecins généralistes à prendre en charge les malades grippés*". Les généralistes traiteront mais ne vaccineront donc pas.

Michel Chassang, président de la Confédération des syndicats médicaux français (CSMF), estime qu'en un jour, les médecins généralistes peuvent vacciner autant que les centres ne l'ont fait en trois semaines. Il réfute les difficultés logistiques évoquées par le fait qu'en Angleterre, en Allemagne et en Belgique, les médecins généralistes utilisent les vaccins multi-doses dans de parfaites conditions de conservation.

Les principaux syndicats de médecins libéraux et généralistes avaient renouvelé leur souhait de participer à la campagne de vaccination. "*Les patients fragiles et handicapés éviteront de longues attentes dans des conditions peu satisfaisantes*", estime MG France. Pourtant, un autre syndicat, le SML, ne juge pas la vaccination en cabinet "*raisonnable*" car les patients sains et malades seraient ainsi mis en contact.

THE FLU CASE

French Health Minister continues to exclude GPs from Swine Flu jab programme

The Flu Case, 1 December 2009.
https://web.archive.org/web/20100102035331/http://theflucase.com/index.php?option=com_content&view=article&id=2140%3Afrench-health-minister-continues-to-exclude-gps-from-swine-flu-jab-programme&catid=1%3Alatest-news&Itemid=64&lang=en

The French Minister of Health Roselyne Bachelot has rejected the request of family doctors to participate in the swine flu vaccination programme, currently being conducted in especially set up vaccine centers.

Bachelot said that she wished to "preserve the capacity of the GPs to care for those who are ill from the flu."

The exclusion of GPs from the country's biggest ever mass vaccination campaign will heighten fears over the safety of the untested swine flu jab and fuel concerns over who will be accountable for any damage or deaths caused.

LE FIGARO

Grippe A: l'alerte maximale envisagée en France

Le Figaro, 1 Decembre 2009, 10:09
https://sante.lefigaro.fr/actualite/2009/12/01/9924-grippe-lalerte-maximale-envisagee-france

La décision de passer au niveau 6 pourrait être prise prochainement. Le Figaro fait le tour des mesures qui pourraient être appliquées.

Lundi, la ministre de la Santé, Roselyne Bachelot, a évoqué la possibilité que la France passe bientôt au niveau 6 du plan de pandémie grippale. Dix nouveaux décès ont été enregistrés depuis vendredi, «avec des personnes qui pour la plupart n'avaient ni facteur de risque, ni problème particulier». Mme Bachelot s'est empressée toutefois de rappeler que ce plan a été imaginé au moment de la grippe aviaire et qu'il constitue avant tout une «boîte à outils». «Il y a des outils dans e niveau 6 qui peuvent d'ores et déjà être utilisés, par exemple l'interdiction des rassemblements. Mais ça ne veut pas dire qu'on (les) utilisera forcément tous», a-t-elle expliqué sur RMC. « La décision de passer au niveau 6 est envisagée mais pas pour demain», expliquait de son côté Didier Houssin, directeur général de la santé.

En France métropolitaine, 2 762 000 personnes ont été touchées par la grippe A. On dénombre 86 décès (plus 28 dans les collectivités d'outre-mer), 305 cas graves dont 101 sont encore en réanimation parmi lesquels 20 % d'enfants de moins de 15 ans.

Ce que prévoit le niveau 6?

• Le ministère de l'Intérieur à la tête des opérations
Le passage au niveau 6 pourrait amener des changements dans l'organigramme de la gestion de la pandémie. Le ministère de l'Intérieur pourrait prendre la main et être appelé à piloter les nouvelles mesures, ces dernières étant toujours décidées dans le cadre de la cellule interministérielle de crise. La Place Bauveau serait également chargée de coordonner les actions conduites au niveau départemental et municipal.

• Rassemblements, réunions publiques et déplacements limités
Le plan prévoit toute une série de mesures barrières visant à freiner et à limiter l'extension de la pandémie. Est citée en priorité la fermeture des crèches, des établissements d'enseignement et de formation, des internats et des centres d'accueil de mineurs. Des mesures indispensables dont l'efficacité est démontrée pour limiter la contagion lors d'épidémies grippales, selon les rédacteurs du plan. L'interruption ou la réduction de certains transports locaux, lieux potentiels de transmission du virus, est également indiquée. Les spectacles, les rencontres sportives, les foires et salons ainsi que les rassemblements festifs pourraient eux aussi être suspendus. Ce type de décision s'inscrirait dans une vraie perspective de santé publique à la différence des récents reports de match de foot motivés avant tout par le fait que plusieurs footballeurs étaient infectés par le virus H1N1. Le plan envisage la suspension de la distribution de documents publicitaires par porteurs.

• Visites et accès limités à certains lieux publics
Le plan évoque la possibilité de restreindre les visites et les accès aux établissements hospitaliers, aux maisons de retraite, aux prisons et aux établissements sociaux et médico-sociaux.

• Mesures d'isolement et port de masques

Les opérations de vaccination des dernières semaines ont éclipsé plusieurs mesures d'hygiène qui avaient été abondamment évoquées au début de l'épidémie. Le passage au niveau 6 pourrait remettre à l'ordre du jour le port de protections respiratoires par les personnels de santé ou le port du masque chirurgical par les personnes indemnes dans les espaces publics qui pourrait être rendu obligatoire dans certains lieux.

• Distribution de sacs plastiques à lien pour les déchets des malades

Le plan tient par certains côtés du catalogue à la Prévert. «Les Français ont l'habitude de construire des cathédrales technocratiques et d'essayer de faire rentrer la réalité des choses dans des mesures administratives», ironisait Roselyne Bachelot lundi sur RMC. Exemple, quelques lignes après avoir évoqué la mise en place du contrôle des prix qui pourrait être décidée sur proposition du ministre des Finances, le plan envisage de déroger aux prescriptions techniques applicables aux véhicules funéraires et, en cas de pénurie, de distribuer des sacs plastiques à lien pour les déchets des malades à domicile.

THE FLU CASE

French Government about to implement full scale Martial Law in pandemic crackdown

The Flu Case, 2 December 2009, 13:52

https://web.archive.org/web/20100102051237/http://theflucase.com/index.php?option=com_content&view=article&id=2165%3Afrench-government-about-to-implement-full-scale-martial-law-in-pandemic-crackdown&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The French government is about to move the country to the highest pandemic alert level allowing the implementation of full-scale martial law, according to a report in Le Figaro.

Measures allowed under the country's highest pandemic level, 6, include

- forced vaccination
- forced quarantine/isolation
- compulsory wearing of face masks/respirators for health personnel
- the distribution of plastic body bags for the "deceased"
- a ban on public gatherings
- a ban on transporting documents by courrier
- closure of all schools and education establishments
- restricted movement
- restricted access to hospitals, old people's homes, prisons and other social institutions
- restrictions in transport, also of food and other supplies

The move to pandemic level 6 under WHO's instructions will strip French people of their basic civic rights at a time when the government has set up the infrastructure for the mass vaccination of the entire population by force mobilising military units to work in the special vaccine centers.

Only about 85 people in France have died from the swine flu according to the authorities, far fewer than for the regular flu.

There are no reliable figures for how many of these deaths were really due to the swine flu and how many were seasonal flu deaths reclassified as swine flu deaths by the government as has been proven to have occured in Scotland.

According to the French government, two to three million people have visited their doctor and are suspected of having the swine flu - and this is enough to enact the draconian legislation and move to compulsory vaccination with an untested and toxic jab for which the pharma companies have no liability.

However, this is clearly a fraudulent manipulation of scientific data to justify an illegal and criminal power grab.

People vaccinated in the special vaccine centers in Laxou en Lorraine have left comments on Le Figaro, saying they had to sit for 2 hours on the floor of a gymnasium before being given the swine flu jab in a box measuring one meter by one meter without any curtains and in full of view of everyone else.

"It is shameful!" says the person.

Are the people of France to be subjected to a degrading vaccination with toxic substances causing long term damage and death -- in many cases, indeed, immediate death -- by force in the full sight of the entire world?

And does the government of France, specifically President Nicolas Sarkozy, Health Minister Roselyne Bachelot and Defence Minister Herve Morin, really think they can get away with this mass murder by closing borders and shutting down the internet?

They can not.

We, the People, of The World refuse to allow this crime to occur, and the people responsible to go unpunished.

We refuse to let it occur in France or any country of the globe.

It is time to End the WHO, End the EU, and bring these criminals in the French and other governments to trial.

THE FLU CASE

Ansturm der Impfwilligen gegen Schweinegrippe auf Arztpraxen abgeebbt

The Flu Case, 2 Dezember 2009
https://web.archive.org/web/20100102022440/http://theflucase.com/index.php?option=com_content&view=article&id=2158%3Agermans-taking-swine-flu-jab-drops-to-new-lows&catid=1%3Alatest-news&Itemid=64&lang=en

Bisher 61 Tote durch Schweinegrippe in Deutschland

Erfurt/Berlin. Der große Ansturm auf die Arztpraxen ist rund fünf Wochen nach Beginn der Impfungen gegen die sogenannte Schweinegrippe offensichtlich vorbei. Die Impffreudigkeit habe in einigen Bundesländern bereits erheblich nachgelassen, berichtete der Leiter der Abteilung Gesundheit im thüringischen Gesundheitsministerium, Heinz Fracke, am Dienstag nach einer Telefonkonferenz mit seinen Amtskollegen. Weitere Einzelheiten wollte er allerdings nicht nennen. Er betonte lediglich, dass infolge der abnehmenden Nachfrage auch die Versorgung mit den Impfstoffen in den meisten Ländern kein Problem mehr sei. Bis zum Jahresende hat Thüringen den Vorsitz in der Gesundheitsministerkonferenz.

Hinsichtlich des speziellen Impfstoffes für Schwangere teilte ein Sprecher des Bundesgesundheitsministeriums in Berlin mit, man gehe davon aus, dass dieser «in Kürze» zur Verfügung stehen werde. Rund 150.000 Dosen eines Präparats der australischen Firma CSL sollen dann bereitgestellt werden. Ursprünglich sollte dieses bereits bis Ende November geschehen.

Schon am vergangenen Wochenende war berichtet worden, dass die Schweinegrippe-Welle langsam abebbt. Indikator dafür ist die Zahl der akuten Atemwegserkrankungen, die insbesondere in Bayern rückläufig ist.

Nach Angaben des Robert-Koch-Instituts sind mit Stand von Freitagnachmittag 61 Menschen an der sogenannten Schweinegrippe gestorben. (ij/ddp)

We, the People's, Struggle for Vaccination Choice

The Flu Case, 2 December 2009, 13:30
https://web.archive.org/web/20100102030745/http://theflucase.com/index.php?option=com_content&view=article&id=2163%3Awe-the-peoples-struggle-for-vaccination-choice-by-paul-g-king&catid=1%3Alatest-news&Itemid=64&lang=en

"*Never, never, never give up*"; "*Success is not final; failure is not fatal: it is the courage to continue that counts*" – Sir Winston Churchill

Introduction

In 2005, an article in the American Journal of Public Health

Today's Realities

Today we, the People, face clearly unconstitutional federal and state laws crafted after "9/11" using "bioterrorism" as their pretext and enacted:

Under the color of law,

At the behest of the pharmaceutical industry and the other facets of the healthcare establishment, without truly open public debate and/or public acceptance, and in the case of the federal "PREP Act", attached to an unrelated defense appropriation bill, finally titled, " Department of Defense, Emergency Supplemental Appropriations to Address Hurricanes in the Gulf of Mexico, and Pandemic Influenza Act, 2006", by conference committee members who, as with the previous "Lily" riders that were inserted in a previous defense appropriation in the dark of night and subsequently repealed, were obviously serving interests other than those of the people.

The federal laws enacted in 2004 ("Biodefense I") and late 2005 ("PREP Act") not only unconstitutionally strip the people of the right to sue for redress if injured but also delegate to a non-elected, political appointee (the Secretary of Health and Human Services [the Secretary of HHS or, simply, the Secretary]) the unilateral right, stated to be not subject to judicial review, to suspend the normal federal safeguards for drug approvals and to protect all those involved in any aspect of any item he or she declares is related to a possible pandemic from being held accountable for their actions unless:

a) the Secretary grants the persons alleging harm the right to seek redress and
b) the persons alleging harm have proof that the person or persons being sued acted with the explicit intent to harm said person or persons or were grossly negligent in their actions.

In the area of vaccination, the state laws generally void all but "recognized medical exemptions" for any mandated vaccination program and allow public health officials to mandate vaccination programs and/or quarantine at sites designated by the public health officials whenever the state's governor declares a "health emergency" – whether or not there really is a health emergency.

NL NOVI LIST

Croatian Health Minister has lied about Swine Flu consent forms, says Lawyer

Novi List // The Flu Case, 2 December 2009, 10:04
http://www.novilist.hr/Vijesti/milinovic-lagao-gradani-potpisom.aspx (deleted).
https://web.archive.org/web/20100102015557/http://theflucase.com/index.php?option=com_content&view=article&id=2151%3Acroatian-health-minister-has-failed-to-explain-implications-of-signing-swine-flu-consent-forms-says-lawyer&catid=1%3Alatest-news&Itemid=64&lang=en

The Croatian Minister of Health has failed to give accurate information about the implications of signing consent forms for the swine flu jab and to make it clear to people that by signing this consent they are taking full responsibility for any harmful effects that could appear, according to a report in Novilist.

Thanks for the translation of the following by Luka:

"Milinovic (Croatian Minister of Health) lied, citizens relieve the state of any responsibility for the side effects by signing the consent form

Chronic patients, pregnant women and the rest of priority groups the doctors have encouraged to get vaccinated have extended their boycott yesterday fearing the possible side effects.

The Minister of Health, Darko Milinović, invited all high-risk groups to get vaccinated for both season and pandemic flu, saying it was the best form of protection.

But the consent form the citizens must sign prior to vaccination dissuaded them from doing so. While the Minister claims the consent forms do not reveal uncertainty and lack of testing of the vaccines, and that the government does not relieve itself from any liability for severe side effects, lawyers claim otherwise: signing the form means the patient claims all responsibility for the consequences of vaccination.

By signing the form, the patient takes full responsibility for any harmful consequences because by the act of signing, he or she gives the consent for them to appear, explains jurist Rajko Mlinarić. Therefore, the state has no legal responsibility towards the patients in case side effects occur, and the patient cannot take any legal action.

The Ministry of Health claims the consents are signed for better tracking of vaccinated citizens, limited vaccination supplies and efficient recording of possible sideaffects. Such consent will be introduced next season for regular flu vaccinations, under proposals by the EU. Drug and medicine agency published a set of forms for quick side effect registration, and a long list of possible, mostly rare side effects that can be very severe.

Additional 195.000 doses of vaccines were distributed yesterday and should be in dispensaries today. Patients showed interested in season flu vaccination while the pandemic vaccine will mainly end up being thrown away if the boycott continues. A total of a million and a half vaccination doses total worth of 70 million HRK (a little less than 10 millions euros) is what the Ministry of Health has acquired for a third of the population.

Quelque 1,3 million de Français vaccinés contre la grippe A

Reuters // Boursier, 3 Décembre 2009, 13h38
https://www.boursier.com/actualites/reuters/quelque-1-3-million-de-francais-vaccines-contre-la-grippe-a-58136.html

Paris (Reuters) La vaccination contre la grippe A(H1N1) monte en puissance avec environ 1,3 million de personnes vaccinées en 18 jours en France métropolitaine, où le virus a fait 92 morts depuis le début de l'épidémie.

Près d'un million de personnes (993.000) ont consulté pour des infections liées au virus la semaine dernière, soit une progression hebdomadaire de 40%, a souligné jeudi la ministre de la Santé, Roselyne Bachelot.

En une semaine, 24 nouveaux décès ont été enregistrés et l'augmentation du nombre de cas graves semble se poursuivre, avec un total de 481 personnes hospitalisées.

"Cette hausse semble ralentir un peu", a toutefois déclaré Roselyne Bachelot lors d'un point sur l'épidémie avec son homologue de l'Intérieur, Brice Hortefeux.

Après une période d'attentisme de la part des Français, des centres de vaccination ont été pris d'assaut ces derniers jours, ce qui a poussé le gouvernement à renforcer le dispositif et faire appel aux bénévoles de la Croix-Rouge et de la Protection Civile, notamment.

Selon Brice Hortefeux, 1,33 million de Français ont été vaccinés en 18 jours, ce qui semble montrer une amélioration du dispositif gouvernemental. "Au rythme actuel, le nombre des vaccinations aura doublé en une semaine", a-t-il assuré.

Objectif: 12 Millions de Français

Le gouvernement, qui a acheté 94 millions de doses de vaccins, entend proposer la vaccination à tous les Français qui le souhaitent sur une durée de quatre mois. Mais un ordre de priorité a été défini.

Le Premier ministre, François Fillon, a indiqué que l'objectif était de vacciner 12 millions de Français dans les semaines qui viennent.

Il avait annoncé mardi un renforcement du dispositif de vaccination, s'excusant des tensions créées par la mise en place de "la plus grosse entreprise de santé publique" jamais organisée en France.

Tous les centres de vaccination seront désormais ouverts de 08h00 à 22h00 du lundi au samedi "notamment en zone urbaine", a précisé le Premier ministre. Dans les grandes agglomérations, sur décision des préfets, les centres seront ouverts sept jours sur sept à partir de dimanche prochain.

Malgré les appels répétés des syndicats de médecins, qui souhaitent participer à la campagne, le Premier ministre a réitéré le refus du gouvernement de faire pratiquer des vaccinations dans les cabinets libéraux.

Cinq mille personnes seront recrutées d'ici dix jours pour pallier l'engorgement des centres de vaccination contre la grippe A(H1N1) en France, a affirmé de son côté le secrétaire d'Etat à l'Emploi, Laurent Wauquiez.

Le gouvernement va permettre aux associations de recruter "5.000 contrats aidés supplémentaires qui seront financés à 100% et seront là pendant six mois", a-t-il dit sur RMC et BFM TV.

Les embauches seront faites par la Croix-Rouge, a-t-il précisé, et devront être achevées "au maximum dans les dix jours".

From: XX
Date: 2009/12/2
Subject: RE:
To:

XX,
thanks so much. We're working under high presure right now.
Our [DUTCH] gouverment has declared they will shut down web-sites about the true information about the vaccine and the flu.

Today our minister of health told about theire interactions on blog's and forum's; so they'll know how the opnions are.
We are aware of that, so we have to be carefull.

I can confirm that Pandemrix is a nano-vaccine.

We are still in court with our minister of health, to give the information about the ingredients in the vaccine. Further more, our advisor of our health minister is Ab Osterhaus who has 13 side-jobs in the farmaceutical industry. Read this:

WHO announced the swine flu pandemic under pressure from a panel of advisers, headed by a Dutch doctor, Albert Osterhaus, nicknamed 'Dr. Flu' (from the name 'Tamiflu') because he was active in promoting mass vaccination of the population through WHO and the Western media.

Ever since I've been investigating the HPV-vaccine's I'm no longer on the gouverment mail-list. They've blocked me.

I have daily information about so many terrible affects of this vaccine. Woman who miscarriage, GBS.

We know now, since the vaccinations took place a week ago at least 7 people died. We only know that by internet -sources. Our media is absolutely quiet about that.

I have proof that our so-called Health Commite, lies about the people who'll have this flu-shot. People were stuck in lines for TV as if they were all there for a Mex. flu-shot. In fact, it was a shot of people in line for a sale and had nothing to do with the Mex. flu shot. They've announced special openings in the weekend, because of the overwhelming amount of people standing in line for the Mex. flu shot.

This is one cruwel joke. I'm sure, not even 40% turned up for this dangerous vaccination.

Our minister of health orderd, 34 miljion dosis and is selling 19 miljion dosis to Macedonia and some African country's.

Riika, you are free to give any information I give you.

We'll keep in touch!
Annelies

Subject:
From:
To:

Hello Annelies,
I saw your message in Mirjaleena Isoaho´s blog.
This what I answered there:
Annelies,

#228, thank you for coming here! We are ve-ry interested about everything you can tell us.

I do not know, if we have a WAC-group here in Finland but I am sure we will find out. And when we do, we´ll let you know.

Our government keeps silent. Yesterday there was "news" in the paper that STM (finnish Social- and Health Ministry) is monitoring chats, blogs and netforums to keep a track of discussions concerning Swineflu.

Some of us have contacted parliament-members, media, Chancellor of justice and Protector General but we get no answers. Media keeps silent.

Hospital personnel has told us -anonymously- that THL (finnish Health- and Wellbeing-department) has forbidden to keep a register of the symptoms people get after vaccination and the dead are neither to be registered.

Private clinics are forbidden by THL to take Swineflutests.

We suspect that Pandemrix is a nanovaccine. They are not patented, licensed, tested yet. If this is so, it is extremely dangerous for pregnant women as it causes irreversible changes in the mitochondryo of the phoetus.

But we do not know for sure it is a nanovaccine. We just strongly suspect this to be so.

There is a person who is demanding in the court that THL submit the papers revealing the real substance of Pandemrix. So far they have refused to do so.

I ´ll enclose a link to next comment, it´s a graphic so that even if you do not understand the language you´ll understand the names (some familiar among them…) and euro-marks

here´s the link http://www.svd.se/nyheter/utrikes/artikel_3866223.svd?service=graphic (deleted)

I´ll send this comment to your e-mail also, in case this blog is shut down.

We are communicating with a swedish MEP and he tells that the media in Sweden ignores his information as if they were told to do so.

Can I give him the message you posted in this blog?

You CAN make a complaint to your Chancellor of Justice, complaint being a breach of rights of a citizen and jeopardizing citizen health, and request him/her to investigate the matter.

Keep in touch!
XX

REUTERS

Cinq mille embauches pour la campagne de vaccination antigrippe

Reuters, 3 Décembre 2009, 4:43 pm
https://www.reuters.com/article/idUSPAE5B204I/

Cinq mille personnes seront recrutées d'ici dix jours pour pallier l'engorgement des centres de vaccination contre la grippe A(H1N1) en France, a affirmé le secrétaire d'Etat à l'Emploi.

Les centres de vaccination sont pris d'assaut depuis leur ouverture à la mi-novembre, ce qui a poussé Nicolas Sarkozy et François Fillon à renforcer le dispositif et faire appel aux bénévoles de la Croix-Rouge et de la Protection Civile.

Le gouvernement va permettre aux associations de recruter "5.000 contrats aidés supplémentaires qui seront financés à 100% et seront là pendant six mois", a dit Laurent Wauquiez sur RMC et BFM TV.

Les embauches seront faites par la Croix-Rouge, a-t-il précisé, et devront être achevées "au maximum dans les dix jours".

Selon la ministre de la Santé Roselyne Bachelot, la France a franchi la semaine dernière la barre du million de personnes vaccinées.

Le directeur général de la Santé, Didier Houssin, a estimé de son côté que deux à trois millions de personnes pourraient être touchées par la grippe A(H1N1).

Five thousand people are to be hired in the next ten days by the French government in order to operate the mass vaccination centers, Laurent Wauquiez, employment secretary has announced.

THANHNIEN NEWS.com

Vietnam requests WHO clarification on H1N1 vaccine safety

Thanh Nien News // Tuoi Tre, 3 December 2009, 22:08:24 Vietnam (GMT+07)
https://web.archive.org/web/20091207094559/http://www.thanhniennews.com/healthy/?catid=8&newsid=54027

Vietnam has asked the World Health Organization to clarify the safety of H1N1 vaccines to be provided to the country after higher

In an urgent communication to WHO, Vietnam has demanded that all information about the Arepanrix H1N1 vaccines produced by the British-owned GlaxoSmithKline, including its dosage and the number of allergic reactions to it in other countries, be clearly stated, the health ministry's Drug Administration said on Wednesday.

The country is expected to receive 1.2 million does of vaccines produced by GlaxoSmithKline from the WHO this month.

Nguyen Huy Nga, head of the health ministry's Preventive Health and Environmental Department, said they planned to vaccinate 800,000-900,000 women who are more than three months pregnant and 280,000 health workers between this month and next February.

According to the Drug Administration, Canada last month withdrew 170,000 doses of the Arepanrix vaccines after six negative reactions were reported. One or two allergic reactions are expected in a batch of that size.

Also on Wednesday the Ministry of Health reported that two more people – a 17-year-old girl and a 33-year-old man in the Mekong Delta of An Giang – have died of swine flu.

Swine flu has so far killed 46 people nationwide.

EU: no safety concerns as 10 mln get H1N1 shots

Reuters, 3 December 2009, 03:38:13 PST
https://www.reuters.com/article/us-flu-europe-idUSTRE5B224520091203/

London, Dec 3 – Some 10 million people across the European Union have now been vaccinated against H1N1 swine flu and so far no unexpected serious safety issues have been identified, the region's drugs watchdog said on Thursday.

The most frequent adverse reactions have been fever, nausea, headache, allergic reactions and injection site pain, but these were mostly non-serious and had been expected, the European Medicines Agency said.

The safety update is the first analysis of adverse reactions following the roll-out of three vaccines across Europe – GlaxoSmithKline's Pandemrix, Novartis's Focetria and Baxter's Celvapan.

New clinical trial data did show a greater incidence of fever following the second dose of Pandemrix in babies from 6 to 35 months and an assessment of that data was ongoing, the agency added.

The Geneva-based World Health Organisation (WHO) said that around 150 million doses of pandemic H1N1 vaccine had now been distributed in more than 40 countries but did not say how many had actually been given to people. [https://jp.reuters.com/article/idUSGEE5B212H/]

THE FLU CASE

"Vaccination Expert" leaves Newspaper to work for WHO

The Flu Case, 3 December 2009 14:02
https://web.archive.org/web/20100102030802/http://theflucase.com/index.php?option=com_content&view=article&id=2176%3Aqvaccination-expertq-leaves-newspaper-to-work-for-who&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The close links between WHO and the media were underlined by the news that the "vaccination expert" of Germany's "Ärzte Zeitung", Tomas Jelinek, has been hired by WHO as a "Consulting Expert to WHO in Travel Medicine."

"Die Ärzte Zeitung" is a newspaper reporting medical news that prints about 65,000 copies for doctors and other health professionals in Germany.

Jelinek has been advising people to take the swine flu jab in his reports, as might be expected if he has just moved to WHO on an unnamed salary.

The "Ärzte Zeitung" presents itself as independent source of information to its readers.

But how credible are these claims when its so-called "vaccination expert" leaves to take up a job in WHO after promoting the WHO flu jab in its pages?

The media has played a key role in the swine flu scam – as it has in the global warming swindle -- by misrepresenting and suppressing facts to shape public attitudes to encourage people to take the swine flu shot, so furthering the agenda of the international corporate crime syndicate that owns media enterprises.

WELT

Pia Heinemann

Schweinegrippe-Impfung jetzt für alle empfohlen

WELT, 3 Dezember 2009
https://www.welt.de/gesundheit/article5416717/Schweinegrippe-Impfung-jetzt-fuer-alle-empfohlen.html

Die Ständige Impfkommission empfiehlt jetzt allen Menschen in Deutschland die Impfung gegen die Schweinegrippe – obwohl die Grippewelle einen Scheitelpunkt erreicht hat. Die Impfungen seien wichtig, weil noch immer nicht vorauszusehen sei, wie sich die Grippe entwickele.

Die Ständige Impfkommission (Stiko) hat eine neue Empfehlung zur Impfung gegen die Schweinegrippe herausgegeben: Alle Menschen in Deutschland sollen nun gegen das Grippe-Virus geimpft werden. Obwohl die Grippewelle einen Scheitelpunkt erreicht hat, hat sich die Impfkommission nun dazu entschieden, dass nun nicht mehr nur medizinisches Personal, chronische Kranke und Schwangere geimpft werden – sondern jeder.

Das Robert-Koch-Institut (RKI), das diese neuen Impfempfehlungen der Stiko gestern herausgegeben hat, betont, dass Impfungen aus dem Grunde wichtig seien, da noch immer nicht vorauszusehen sei, wie sich die Grippe im Laufe des Winters entwickele. Noch ist die normale saisonale Grippe in Deutschland nicht großflächig angekommen – noch müssen die Menschen also nicht mit zwei Influenzaviren zurechtkommen. Das Robert-Koch-Institut in Berlin erklärt weiter, mittlerweile habe sich gezeigt, dass nicht – wie ursprünglich gedacht – zwei Spritzen notwendig sind, um einen ausreichenden Immunschutz aufzubauen. Vielmehr reiche eine Spritze. Ende November hatte die Weltgesundheitsorganisation WHO davor gewarnt, die Schweinegrippe zu unterschätzen. Der WHO-Grippeexperte Keiji Fukuda betonte damals, der einzige Schutz gegen eine Grippe sei die Impfung.

Angela Spelsberg, Epidemiologin und Vorstandsmiglied der Anti-Korruptions-Organisation "Transparency International" sei das Them Grippeimpfung aber auch von Geschäftsinteressen geprägt. Dem Sender "Deutschlandradio Kultur" sagte sie: "Wir beobachten da massive Interessenkonflikte". Das Robert-Koch-Institut weist derartige Vorwürfe aber zurück. Die Grippewelle dauere noch an, erklärte das RKI. Auch nach dem Erreichen des Scheitelpunkts einer Welle träten in der Regel mindestens noch einmal so viele Fälle auf wie davor. Von früheren Grippe-Pandemien wisse man, dass sie oft in mehreren Wellen auftreten.

Nachdem Anfang Oktober zunächst die Impfung für Medizinpersonal, chronisch Kranke und Schwangere empfohlen wurde, erklärte die Stiko nun, "in Abhängigkeit von der Verfügbarkeit der Impfstoffe stufenweise die Impfung aller Indikationsgruppen durchzuführen". Bisher galt, dass vor allem Risikogruppen wie Mediziner und chronisch Kranke sich impfen lassen sollten. Nun wird die Impfung zudem den Menschen empfohlen, in deren Umgebung sich nicht geimpfte, zur Risikogruppe gehörende Personen befinden, zum Beispiel Angehörigen von chronisch Kranken. Auch Kinder und junge Erwachsene bis 24 Jahre immunisiert werden, in einer nächsten Stufe über 60-Jährige. Im weiteren Verlauf sollen dann Personen im Alter von 25 bis 59 Jahren und schließlich Personen ab 60 Jahre geimpft werden.

In Deutschland sind bis zum 1. Dezember 66 Menschen im Zusammenhang mit der Schweinegrippe gestorben. Bei rund drei Vierteln von ihnen gibt es laut RKI Hinweise darauf, dass sie an einer anderen Krankheit litten. "Die Daten unterstreichen jedoch auch ein erhöhtes Risiko von jungen Kindern und von Jugendlichen, sowohl an der Neuen Influenza zu erkranken als auch schwere Krankheitsverläufe zu entwickeln."

In die Diskussion um die Sicherheit des Impfstoffes bringt das PEI nun auch erste Zahlen ein: Ihm wurden bislang 658 Verdachtsfälle von Reaktionen nach einer Schweinegrippe-Impfung gemeldet. 15 Menschen starben nach einer Impfung. Doch bei keinem Patienten habe es einen Zusammenhang zwischen der Impfung und dem späteren Tod gegeben, sagte eine Sprecherin des PEI. Die meisten später gestorbenen Patienten seien vorerkrankt gewesen. Nach PEI-Angaben wurden bundesweit 4 bis 5,8 Millionen Dosen Pandemrix verimpft.

Beim PEI liegen, wie in anderen Staaten auch, "keine Hinweise für vermehrte schwere unerwünschte Wirkungen nach einer Impfung vor", meldet das PEI. "Aber wie vor anderen Impfungen sollte auch bei der neuen Impfung grundsätzlich eine individuelle Nutzen-Risiko-Abwägung vorgenommen werden. Die Organisation der Impfung ist Aufgabe der Länder."

Erstmals gab es auch ein Fall nach der Impfung mit Celvapan, dem Impfstoff ohne Wirkverstärker (Adjuvans). Dieser Impfstoff wurde als "Bundeswehrimpfstoff" bekannt. Bei dieser Nebenwirkung nach einer Celvapan-Impfung habe es sich aber um "eine anaphylaktische Reaktion" gehandelt, betonte die PEI-Sprecherin. Solche überschießenden Immunantworten treten laut PEI nach Impfungen mit einer geschätzten Häufigkeit zwischen ein und zehn Fällen pro einer Million Dosen auf.

Das PEI verwies auf eine Studie aus Schweden, die ebenfalls unerwartete Reaktionen nach der Schweinegrippe-Impfung auflistet. Dort wurden bis Mitte November unter anderem 26.000 Kinder bis drei Jahre geimpft. In zwei Fällen mussten die Kinder mehrmals erbrechen. Außerdem seien 31.000 Schwangere mit Pandemrix geimpft worden. Vier Fehlgeburten und ein im Mutterleib gestorbener Fötus standen dabei im zeitlichen Zusammenhang mit der Impfung –allerdings sei die Impfung nicht die Ursache gewesen.

Die Ständige Impfkommission erinnerte darüber hinaus an die Impfung gegen die saisonale Grippe, "die den bekannten Risikogruppen weiterhin empfohlen wird: chronisch Kranke und Personen über 60 sowie medizinisches Personal und Menschen mit viel Kontakt zu anderen". Zur Verringerung des Infektionsrisikos sollten nach wie vor die persönlichen Hygienemaßnahmen wie häufiges Händewaschen beitragen.

All Germans should now get Swine Flu shot, say government "Experts"

The Flu Case, 4 December 2009, 16:31

https://web.archive.org/web/20100102050608/http://theflucase.com/index.php?option=com_content&view=article&id=2184%3Aall-germans-should-now-get-swine-flu-shot-say-government-qexpertsq&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A key German government vaccine body, STIKO, has changed its guidenlines to expand the scope of the mass swine flu vaccination campaign, saying that the entire population should now be given the swine flu shot, according to the newspaper, Augsburger Allegemeine.

Augsburger Allgemeine

Schweinegrippe: Impfung jetzt für alle empfohlen

Augsburger-Allgemeine, 4 Dezemver 2009, 09:12 Uhr
https://www.augsburger-allgemeine.de/politik/Staendige-Impfkommission-Schweinegrippe-Impfung-jetzt-fuer-alle-empfohlen-id6962016.html

Schweinegrippe-Impfung für alle: Die Ständige Impfkommission (STIKO) rät, dass sich jeder Deutsche gegen das H1N1-Virus impfen lassen sollte.

Die Ständige Impfkommission (STIKO) ist die zentrale, wissenschaftliche Einrichtung der Bundesrepublik Deutschland zur Krankheitsüberwachung und -Vorsorge.

Im Kampf gegen die Schweinegrippe überprüft die STIKO regelmäßig die Situation in Deutschland und gibt dann entsprechende Impfempfehlungen heraus. Anfang Oktober etwa rieten die Experten, dass sich vor allem medizinisches Personal wie Ärzte oder Krankenschwestern, chronisch Kranke und Schwangere gegen die Schweinegrippe impfen lassen sollten.

In ihrem aktuellen epidemiologischen Bulletin geht die Impfkommission nun einen Schritt weiter. Die Experten empfehlen jetzt eine Schweinegrippe-Impfung für alle Menschen. Zunächst sollten sich Menschen, die mit besonders gefährdeten Personengruppen Kontakt haben, impfen lassen, etwa Eltern von Kindern unter sechs Monaten. Dann sollten Kinder und Erwachsene bis 24 Jahre zur Schutzimpfung. Danach sollten - sofern Impfstoff vorhanden ist - Menschen im Alter von 25 bis 59 Jahren, und schließlich die über 60-Jährigen geimpft werden.

"Die STIKO weist darauf hin, dass die Impfung gegen die Neue Influenza A (H1N1) wie alle Impfungen nach individueller Nutzen-Risiko-Abwägung vorgenommen werden soll. Das gilt insbesondere für chronisch Kranke, Kinder und Schwangere", ergänzten die Experten wörtlich.

Zugleich gingen die Experten auf die Sorge vor unerwünschten Nebenwirkungen der Schweinegrippe-Impfung ein: "Die bisher verfügbaren Daten zur Sicherheit der adjuvantierten Impfstoffe gegen die Neue Influenza A (H1N1) enthalten keine Hinweise für ein vermehrtes Auftreten schwerer unerwünschter Wirkungen. Der überwiegende Teil der Meldungen an das Paul-Ehrlich-Institut (PEI) beschreibt Impfreaktionen an der Injektionsstelle und milde Allgemeinreaktionen."

Das Robert-Koch-Institut registrierte bis zum 27. November 2009 insgesamt 172.627 Infektionen mit Schweinegrippe in Deutschland. "Im Gegensatz zur Situation in den Sommermonaten, als die gemeldeten Neue Influenza A (H1N1)-Infektionen mehrheitlich aus dem Ausland importiert waren, wurden 95 % der seit dem 28.09.2009 gemeldeten Fälle in Deutschland erworben", so das RKI. Da nicht alle Erkrankten zum Arzt gingen und nicht bei allen Verdachtsfällen Test gemacht würden, sei von einer "erheblichen Untererfassung der Fälle" auszugehen.

H1N1 pandemic ending with a whimper, not a bang

The Gazette, 4 December 2009
https://web.archive.org/web/20091208101956/http://www.montrealgazette.com/health/H1N1+pandemic+ending+with+whimper+bang/2304630/story.html

With H1N1 poised to enter history as the least deadly of four global flu pandemics, some experts are calling for an end to Canada's mass vaccination program.

Nature is already achieving what we would hope to achieve by vaccinating, they say.

H1N1's "reproductive number" – the number of people each infected person passes the virus to – was above one when the epidemic began, which led to the explosive initial increase in cases.

Now it is less than one, because many people have become immune, and each old case is making less than one new case. When the reproductive number falls below one, the epidemic can't sustain itself, and fades away.

The drop in cases suggests Canada has hit the critical fraction of the population that needs to be vaccinated to control the pandemic, says Dr. David Fisman, a University of Toronto expert in infectious disease dynamics.

Fisman can't understand the rational for continuing mass vaccinations. He said that for a virus as contagious as H1N1, fewer than 30 per cent of the population needed vaccination to reach a critical level of immunity.

"I'm sure that the vaccine has prevented some deaths. I'm sure that there are people who are alive right now who would not have been alive if we hadn't vaccinated," he says. But the pandemic was already peaking, and then subsiding before the vaccination was rolling out in force.

"That's nobody's fault, that's just how long it took to make a vaccine against a brand new virus. Those were the cards we were dealt," says Fisman, an associate professor of infectious diseases epidemiology at the University of Toronto's Dalla Lana School of Public Health.

Despite that view, Canada's top doctor this week pleaded with Canadians to get vaccinated if they have not already done so. Chief public health officer David Butler-Jones said that, while 30 per cent of the population is now immune to H1N1, either because they have been vaccinated or because they have already been infected, "millions" of people are still at risk of infection.

Someone vaccinated today may be protected against infection two weeks from now, "if there is still enough of (H1N1) kicking around," Fisman says. But the benefit diminishes the further into the future we go, and he says other public health programs have suffered as staff and resources were redeployed to the H1N1 campaign. In some jurisdictions, breastfeeding support programs, sexually transmitted diseases clinics and other usual activities were cancelled or postponed as public health was forced to bear the brunt of delivering the largest immunization program in Canada's history.

"At this point, in terms of saying everybody must get vaccinated because there is a pandemic abroad, it's kind of done," Fisman says.

H1N1 will likely die out with a death rate lower than that for regular seasonal flu.

Harvard University infectious disease expert Marc Lipsitch is pegging H1N1's case fatality rate – the proportion of people infected with a disease who die of it – at less than 0.1 per cent, placing human swine flu in a category 1 pandemic, the lowest level of severity for a worldwide disease outbreak. Swine flu's case fatality rate is less than what was seen for the three worldwide flu outbreaks in the 20th century: 1918, 1957 and 1968.

Unless the virus mutates, and there is no strong sign H1N1 is becoming noticeably different, "it's almost certainly going to be the mildest of the four (pandemics) that we have good data on," says Lipsitch, a professor of epidemiology at the Harvard School of Public Health.

When the World Health Organization declared the pandemic in June, officials warned the rogue virus threatened all of humanity. The reality is so far proving strikingly different from what was expected.

The world agency, and Canada, had done their pandemic planning with a different flu virus in mind. They spent five years watching H5N1, or "bird flu," which kills up to 60 per cent of those it infects.

We got off lucky when the real pandemic hit, WHO says, but the public doesn't always understand that.

"Adjusting public perceptions to suit a far less lethal virus has been problematic," WHO said in a statement Thursday, issued in response to media reports that ties with the drug industry among expert advisers may have influenced WHO's policy decisions related to H1N1.

"Given the discrepancy between what was expected and what has happened, a search for ulterior motives on the part of WHO and its scientific advisers is understandable, though without justification.

"WHO has consistently assessed the impact of the current influenza pandemic as moderate. WHO has consistently reminded the medical community, public and the media that the overwhelming majority of patients experience mild influenza-like illness and recover fully within a week, even without any form of medical treatment."

But some critics say WHO set itself up for blame.

"They had been talking for years about the possibility of some kind of reprise of the 1918 pandemic," says Philip Alcabes, author of Dread: How Fear and Fantasy Have Fueled Epidemics from the Black Death to the Avian Flu. "A huge amount of money and person power was devoted to preparing" for the next outbreak, he says.

But, "there was never any evidence, not from Day 1, and not anytime since, that this strain of flu was going to be a particularly dangerous strain, either in terms of its capacity to make people sick or its capacity to kill people," says Alcabes, associate professor in urban public health at Hunter College's School of Health Sciences in the City University of New York.

"Yet that's the story that's always been told, almost every single day since it appeared in April. 'We don't know what's going to happen.' Essentially, 'the sky might fall.'"

Lipsitch, of Harvard, says that when the first reports were coming out of Mexico, the case fatality rate estimates were as high as four per cent, which is twice the rate for the 1918 Spanish flu.

"If you don't know how bad your enemy is, you plan as if it's bad, and you hope that you're over-planning. In this case, that's exactly what was done," he says.

"I think the response has been appropriate for what we knew at each stage, but what we know has changed, because the data gets better."

Le Journal du Dimanche

Grippe A-Paris: La vaccination renforcée

Le Journal du Dimanche, 5 December 2009.
http://www.lejdd.fr/Societe/Sante/Depeches/Grippe-A-Paris-La-vaccination-renforcee-155583/

La mairie de Paris a annoncé vendredi l'ouverture de "10 gymnases supplémentaires d'ici la fin de la semaine" dans le cadre du plan de vaccination contre la grippe A-H1N1. Pour faire face à "l'affluence accrue" et les "files d'attente considérables", la ville de Paris mobilisera "200 agents administratifs municipaux afin de faciliter l'accueil des personnes". Quatre centres de vaccination destinés aux enfants de moins de 3 ans seront transférés "vers des gymnases qui garantissent des conditions d'attente plus confortables" et les horaires d'ouverture seront doublés dès samedi.

"Nous demandons à l'Etat qu'il continue d'adapter son plan, de façon pragmatique, à la réalité des besoins, en diversifiant davantage les lieux et les modalités de vaccination, et en mobilisant des moyens accrus pour l'appliquer", poursuit le texte en rappelant enfin que de nombreuses "personnes isolées et en perte d'autonomie" ne peuvent se rendre d'elles mêmes dans les centres de vaccination.

Grippe A: Dispositif renforcé à Paris

Paris Match, 5 December 2009, 16:00
https://www.parismatch.com/Actu/Sante/Grippe-A-Dispositif-renforce-a-Paris-168208

Face à l'afflux de candidats à la vaccination, les préfets d'Ile-de-France ont renforcé le dispositif de vaccination contre la Grippe A. A Paris, 10 nouveaux centres, fonctionnant de 8 heures à 22 heures, ont ouvert leurs portes ce samedi 5 décembre, venant s'ajouter aux 12 centres déjà existants. Au total, ce sont 166 centres qui sont ouverts en Ile-de-France. Débutée le 12 novembre, la campagne de vaccination a déjà permit de vacciner 252 800 franciliens prioritaires et à risques. Pour la seule journée du vendredi 4 décembre, 27 853 personnes qui ont été vaccinées, dont 5 604 à Paris.

"Strengthened" Vaccination Centers to Open in Paris

The Flu Case, (4 December 2009), 16:36
https://web.archive.org/web/20100102004345/http://theflucase.com/index.php?option=com_content&view=article&id=2185%3Aqstrengthenedq-vaccination-centers-to-open-in-paris&catid=1%3Alatest-news&Itemid=64&lang=en

The mayor of Paris has said that 10 additional sports facilities are to be opened by the end of the week as part of the operation to mass vaccinate the entire population with the swine flu shot.

These additional facilities appear to fall under the category "vaccination renforcée" and to have extra security features as outlined in the Health Ministry vaccination plan leaked in August.

LE FIGARO

H1N1/vaccination: dispositif "renforcé"

Le Figaro, AFP, 5 Decembre 2009, 14:24
https://www.lefigaro.fr/flash-actu/2009/12/05/01011-20091205FILWWW00641-h1n1vaccination-dispositif-renforce.php

Le dispositif de vaccination contre la grippe H1N1 a été "renforcé" à partir de samedi en Ile-de-France, avec l'ouverture de 10 nouveaux centres à Paris, annonce le préfet de police, préfet de la zone de défense Ile-de-France dans un communiqué.

En Ile-de-France, la campagne de vaccination contre la grippe H1N1, débutée le 12 novembre dernier, a permis de vacciner 252.800 personnes prioritaires et à risques, précise la préfecture de police, ajoutant que pour la seule journée du vendredi 4 décembre, ce sont 27.853 franciliens qui ont été vaccinés, dont 5.604 à Paris.

"Pour accompagner l'accroissement de la fréquentation des centres, particulièrement en fin de semaine, les préfets de la zone Ile-de-France ont été conduits à augmenter les capacités de vaccination", poursuit le texte. Ainsi 166 centres sont désormais ouverts en Ile-de-France. A Paris et dans l'agglomération parisienne, ces centres sont ouverts 7 jours sur 7 de 8 heures à 22 heures.

A Paris, 10 nouveaux centres, fonctionnant de 8 heures à 22 heures, ont ouvert leurs portes ce samedi 5 décembre dans les 7ème, 10ème, 11ème, 13ème, 14ème, 15ème, 17ème, 18ème, 19ème et 20ème arrondissements, venant s'ajouter aux 12 centres déjà existants.

L'OBS

Vaccination: dispositif renforcé en Ile-de-France

L'Obs, 6 décembre 2009, 10h47

La préfecture de police a annoncé samedi l'ouverture de 10 nouveaux centres de vaccination dans la région Capitale. 27.853 Franciliens ont pu être vaccinés dans cette seule journée.

Avec l'ouverture de 10 nouveaux centres à Paris, le préfet de police, préfet de la zone de défense Ile-de-France, a annoncé dans un communiqué le samedi 5 décembre que le dispositif de vaccination contre la grippe H1N1 avait été "renforcé". Déjà 252.800 personnes prioritaires et à risques on pu être vaccinées dans la région Ile-de-France, depuis le début de la campagne, le 12 novembre dernier, a précisé la préfecture de police. Ajoutant que 27.853 Franciliens ont été vaccinés dans la seule journée du 4 décembre, dont 5.604 à Paris.

"Pour accompagner l'accroissement de la fréquentation des centres, particulièrement en fin de semaine, les préfets de la zone Ile-de-France ont été conduits à augmenter les capacités de vaccination", poursuit le communiqué. 166 centres sont donc désormais ouverts en Ile-de-France.

A Paris et dans l'agglomération parisienne, ces centres accueillent 7 jours sur 7, de 8 heures à 22 heures, excepté le lundi où ils ouvrent à 12h30. Dans la capitale, 10 nouveaux centres, fonctionnant de 8 heures à 22 heures, ont ouvert leurs portes ce samedi 5 décembre dans les 7ème, 10ème, 11ème, 13ème, 14ème, 15ème, 17ème, 18ème, 19ème et 20ème arrondissements, venant s'ajouter aux 12 centres déjà existants.

111 décès en France métropolitaine (139 avec l'outre-mer)

Le lundi, les centres d'Ile-de-France ouvrent au public à compter de 12H30, "afin de permettre en matinée le réapprovisionnement en vaccins et matériel médical, ainsi que la remise en état des lieux garantissant des conditions d'hygiène et d'accueil satisfaisantes", a précisé le communiqué. "La campagne de vaccination dans les centres reste, pour l'instant, réservée aux personnes les plus vulnérables, qui ont reçu un bon de vaccination de la Caisse Nationale d'Assurance Maladie" a-t-on rappelé. Sont notamment concernés les nourrissons de 6 à 23 mois, ainsi que leur entourage (pour les nourrissons de moins de 6 mois), les femmes enceintes, les personnes présentant un facteur de risque particulier, et enfin, les professionnels de santé.

La ministre de la santé, Roselyne Bachelot, a indiqué samedi que le nombre de personnes vaccinées avait franchi en France le cap des deux millions. Par ailleurs, la grippe H1N1 fait 111 décès en France métropolitaine (139 avec l'outre-mer).

The News & Advance

Liz Barry

Turnout low for swine flu vaccine clinics

The News & Advances, 6 December 2009
https://newsadvance.com/news/local/turnout-low-for-swine-flu-vaccine-clinics/article_ad3ec2fc-4e62-52dd-acdc-9aef0d704922.html

Turnout was lower than expected at Central Virginia Health District's five H1N1 vaccination clinics on Saturday, with a total of 324 doses administered across the district.

The shot and nasal spray vaccines were offered for free at sites in Lynchburg, Amherst, Bedford, Appomattox and Campbell County. People considered "high risk" for complications, such as pregnant women, young people and people with chronic medical conditions, were the target demographic.

Upwards of 25 people were waiting when the Lynchburg site opened at 9 a.m. After the initial rush, people trickled through the door until the clinic closed at noon.

"We had the initial push, but they've been slowly coming in," said Shayla Anderson, public information officer for the Central Virginia Health District.

The Lynchburg clinic was prepared to administer 300 doses of the vaccine. In the end, they gave out 99.

Kerry Gateley, director of the Central Virginia Health District, said he has noticed a drop in the demand for the vaccine over the past two weeks. Part of that he attributes to the fact that many high-risk patients have already gotten the vaccine.

Listen now and subscribe: Apple Podcasts | Google Podcasts | Spotify | RSS Feed | Omny Studio

"We're getting into a population of people who are not so certain about their risk or not so certain they want the vaccine."

Rain and snow also might have contributed to the low numbers, Gateley said.

This was the health district's first weekend clinic. Previously, it has also administered vaccinations in schools and to high-priority groups.

Lynchburg resident Roger Clements, 49, came to the clinic with his two sons, Roger, 19, and Gordon, 22, since their family doctor does not offer the vaccine.

Clements, who has diabetes, is in the high-risk category, along with his sons, who are both under the age of 25.

"We've been hoping to get the vaccine long before now," Clements said, who added that he got the vaccine both for "peace of mind" and to "satisfy my wife."

Gateley emphasized that the Virginia Department of Heath will continue to offer the vaccine as long as necessary.

THE WALL STREET JOURNAL

David Gauthier-Villars

France takes another shot at combating H1N1 threat

The Wall Street Journal, 7 December 2009, 12:01 am ET
https://web.archive.org/web/20091208004606/http://online.wsj.com/article/SB126013820647379157.html

PARIS - France is playing catch-up in rushing to vaccinate a large part of its 65-million-strong population against the H1N1 virus, after being ahead of the game in developing and buying vaccines earlier this year.

Last month, vaccination vouchers were mailed to children, pregnant women and elderly people -- categories that get precedence in receiving the shot. So far, two million people have been vaccinated and health authorities are aiming to reach the 30-million mark by February.

French Health Minister Roselyne Bachelot, right, holds the hand of a woman receiving an H1N1 vaccine on Saturday at a vaccination center in Marcq-en-Baroeul.

On Sunday at Paris's Jean Dame municipal sports center, near the former mercantile exchange, doctors and nurses hosted patients in a labyrinth of cubicles with cardboard dividers, the first Sunday vaccination centers were open.

"We've treated 200 patients so far," said the director of the makeshift vaccination center.

The rush for shots is quite a turn of events. France was one of the fastest countries to develop a countrywide vaccination campaign for the H1N1 "grippe," or flu. Since the summer of 2003, when an estimated 15,000 people died nationwide because of a heat wave, the French government has taken great care in preparing itself against any health risk.

Health authorities ordered 94 million shots from drug makers, including Sanofi-Aventis SA of France and GlaxoSmithKline PLC of the U.K.

That is far more than the French population, but authorities originally thought people might need two shots for the vaccine to be effective.

France's national health-insurance agency CPAM, which is facing a deficit of about €10 billion ($14.9 billion) this year, was asked to foot the bill for most of the overall €1 billion vaccine cost.

The government organized a major advertising campaign on why everyone should get vaccinated. France's Health and Sports Minister Roselyne Bachelot -- a grandmotherly figure who recently sported pink Croc shoes at a cabinet meeting -- regularly appeared on television to remind people to wash their hands and get vaccinated.

Radio and television ads were blasted over the airwaves, saying "the vaccination offers the best protection."

The problem was, nobody listened.

Doctors didn't push the vaccine and even pooh-poohed it with patients. Bernard Debré, a French urologist and lawmaker affiliated with the ruling UMP Party of President Nicolas Sarkozy, publicly played down the dangers of swine flu.

When the vaccines became available on Nov. 12, virtually nobody showed up. French television broadcast footage of nearly empty vaccination centers.

The phenomenon is similar to what is happening in other European countries. In Italy and Spain, the vaccine is readily available but people are staying away. While the health ministries of both countries are encouraging vaccination, doctors are far more blasés with their patients.

So what changed in France? Over the past few weeks, French papers have publicized deaths from H1N1. Late last month, Ms. Bachelot said 22 more patients with H1N1 had died.

The population panicked. Now a popular refrain is that the French government isn't moving fast enough – and that health centers are giving out the vaccine in dribs and drabs.

The latest wave of public demands has prompted Mr. Sarkozy to call in the army to help keep new makeshift vaccination centers open until late at night and on the weekends. Medical students have also been drafted to help nurses across the country administer shots.

Still, bureaucratic hassles are also holding things up.

"The vaccination vouchers I received are for my kids," said Nathalie Heckel, a Parisian mother of two. "That means I'll have to queue up again for my own shot."

Because it overestimated its need, France has millions of extra vaccine doses that can't be stored until next year. The government has said France may donate part of its stockpile to poor nations and sell the rest on the international market.

THE FLU CASE

France wants to give 30 million people the Swine Flu jab by February

The Flu Case, 7 December 2009 12:40
https://web.archive.org/web/20100102054905/http://theflucase.com/index.php?option=com_content&view=article&id=2197%3Afrance-wants-to-give-30-million-people-the-swine-flu-jab-by-february&catid=1%3Alatest-news&Itemid=64&lang=en

A leaked French government *document in August* revealed plans to vaccinate the entire French population against swine flu between the end of September 2009 and the end of January 2010.

However, concerns surrounding the untested vaccine as well as the secret contracts with the phramacuetical companies promised total immunity, have taken their toll.

There is also the additional detail that there is verifiably no pandemic threat from the swine flu.

Only 2 out of 65 million people in France have taken the jab so far - and that mostly due to fear mongering by the French Health Minister Roselyne Bachelot as the Wall Street Journal freely admits.

"Over the past few weeks, French papers have publicized deaths from H1N1. Late last month, Ms. Bachelot said 22 more patients with H1N1 had died.

The population panicked..." writes the WSJ.

Grippe A: les élèves infirmiers ne soigneront que s'ils sont vaccines

The Flu Case // Maxisciences, 7 décembre 2009, 13h08
https://web.archive.org/web/20100102030653/http://theflucase.com/index.php?option=com_content&view=article&id=2219%3Afrench-student-nurses-told-take-swine-flu-jab-or-go-home&catid=1%3Alatest-news&Itemid=64&lang=en

France - Les étudiants infirmiers du CHU de Bordeaux ne seront pas autorisés à soigner les patients hospitalisés s'ils ne sont pas vaccinés contre la grippe A. Ils ne seront autorisés à s'approcher des patients que dix jours après avoir reçu l'injection.

Depuis le 4 décembre, pour les unités pédiatriques, les étudiants infirmiers qui ne sont pas vaccinés contre la grippe A ne sont pas autorisés à s'approcher des patients par mesure de protection. Pour les autres services, la mesure prendra effet le 8 décembre.Une fois vaccinés, les étudiants devront attendre dix jours avant de pouvoir à nouveau se rendre sur leur lieu de stage. La nouvelle a fait grincer des dents les étudiants qui ne comprennent pas que les personnels médicaux titulaires aient pu se faire vacciner en interne, pour les volontaires, alors qu'eux doivent se rendre en centre de vaccination.Si le CHU de Bordeaux ne doit officiellement prendre sa décision qu'aujourd'hui, plusieurs étudiants ont été renvoyés chez eux dès vendredi. Les étudiants n'entendent pas se laisser faire et s'étonnent de ne pouvoir travailler alors qu'on les réquisitionne en centres de vaccination, qu'ils soient vaccinés ou pas. L'obligation de se faire vacciner est normalement interdite par la loi.

Swine flu vaccine programme in disarray

The Telegraph, 9 December 2009, 7:30 AM GMT
https://web.archive.org/web/20091210215853/http://www.telegraph.co.uk/health/swine-flu/6762038/Swine-flu-vaccine-programme-in-disarray.html

The swine flu vaccination programme for children under five has been thrown into disarray after a furious row between ministers and GPs.

Children aged between six months and five years were supposed to be offered the vaccine from the middle of December.

However, that is now in doubt after negotiations between the Government and GPs over how the scheme would be administered broke down.

The sticking point in the talks was over how GPs and clinics would have the time for the extra appointments without losing out financially.

The Daily Telegraph understands ministers would not agree to relax the target that GPs must see patients within 48 hours in order to free-up time for the vaccination programme.

GP practices lose substantial amounts of income if they miss the 48-hour target.

However, sources at the Department of Health claimed GPs wanted more money for administering each vaccine than the £5.25 that was agreed early in the discussions - an allegation the British Medical Association denies.

Local arrangements will now have to be made with the NHS in each area negotiating separately with their GP representatives over what tasks practices can drop in order to free up time.

Children under five are the group most likely to be admitted to hospital with complications from swine flu. Admission rates are still rising in young children even though overall, new cases of the virus are dropping.

GPs are already offering the swine flu vaccine to nine million people in the priority groups, including pregnant women and people with long-term illnesses.

Adding three million healthy children to the vaccination programme at the same time would have put greater time pressures on surgeries at their busiest time of year, family doctors argued.

Andy Burnham, Health Secretary, said vaccinations for children would begin before Christmas but Dr Laurence Buckman, chairman of the British Medical Association's GPs Committee said this would now be 'extremely difficult' for most practices.

The age group involved means it is highly unlikely any vaccination programme could be carried out in schools without the assistance of GPs.

Dr Laurence Buckman, Chairman of the BMA’s GPs Committee, said "We sincerely wanted to be able to reach a national agreement with the UK governments about a process for vaccinating the under-fives against swine flu.

"Unfortunately, this has not been possible, because the government would not support adequate measures to help free up staff time. At the busiest time of the year for general practice, with surgeries already dealing with the additional work of vaccinating the first wave of at-risk groups, we felt this was vital in order to ensure this next phase could be carried out quickly.

"We appreciate that parents of young children might be worried when they hear that there will be no national framework and want to assure them that this does not mean their children will not be vaccinated."

A spokesman for the Department of Health said parents of young children will receive information about the vaccines as soon as local plans have been put in place.

A statement said: "We hope many GPs will still decide to vaccinate under fives. But where GP practices do not wish to vaccinate this group, PCTs will determine whether vaccinations will be offered through other local GP practices, their directly managed staff (e.g. health visitors, district nurses etc) or by arranging with alternative providers (e.g. community or hospital paediatric services, pharmacies etc)."

Mr Burnham said: "It is disappointing that we have not been able to come to a national agreement with GPs to vaccinate children from six months to five years old.

"But we are now getting on with the job and asking local health trusts to put local plans in place so that vaccination of these children can begin seamlessly.

"The supply of vaccine is increasing and we should therefore be able to meet the demand for vaccine and begin vaccinating children before Christmas.

"I want to take this opportunity to thank NHS staff for their exemplary efforts to put in place this vaccination programme swiftly and remind people in the priority groups for vaccination to ensure they are protected."

The fee of £5.25 per vaccine administered and is the same rate as GPs receive for vaccinating people in the priority groups.

Indigenous human trials for H1N1 vaccine in India

Nagaland Post, 9 December 2009
https://nagalandpost.com/index.php/indigenous-human-trials-for-h1n1-vaccine-in-india/

An indigenous swine flu vaccine is far from ready but India has given the green signal to two foreign pharmaceutical giants to begin human trials of their vaccine in the country.

"GlaxoSmithKline (GSK) and Baxter have received approval from the drug controller of India to carry out human trials in India. The bridge study with volunteers will tell us whether their medicine is safe for us or not," V.M. Katoch, secretary, department of health research in the health ministry, told IANS.

According to the health ministry, India has already placed orders for more than one million doses of swine flu vaccines from GSK and Novartis. But before that is administered, the government wants to ensure that the vaccines are absolutely safe. "Through the above two bridge studies, we are trying to ascertain the safety factor. Whether they are toxic, paralysing or have any other side effect," Katoch said, adding that these human trials would be conducted in several cities.

"They have their own centres in several places of India. The trial will be conducted by these companies on volunteers," the secretary said.

Since India reported its first swine flu case in May, the country has lost over 627 lives to the contagious virus. Over 20,000 people from across the country have already been infected by Influenza A (H1N1). With over 230 deaths, Maharashtra is the worst affected state in terms of mortality and Delhi is the worst in terms of people being infected by swine flu. The national capital has so far reported nearly 6,000 cases, but fortunately less than 30 people of them have succumbed to H1N1.

When asked about the current status of indigenous swine flu vaccine, Katoch said: "We believe they will be ready by April." And would it be of any use then?

"Swine flu is here to stay for some more time. The surge will continue for more than one and half years from now. We cannot take it lightly.

Generally, pandemics have more a life of more than two and half years. Some people develop resistance but the threat factor to common people is quite big," Katoch said, allying fears that the homegrown vaccine may arrive too late to be of any value.

Three pharma companies – Serum Institute of India (Pune), Bharat Biotech (Hyderabad) and Panacea Biotech (New Delhi) – are working on developing the vaccine. The Pune based company is leading in the race to roll it out first.

Authorities said while all imported vaccines would take care of the high-risk groups, the general public may get their share of vaccination once the ingenious vaccine rolls out after April next year. Earlier, the health ministry has said the indigenous vaccine would be available by the end of 2009 or early January.

Grippe A. Dans le Calvados on va vacciner hors des centres

Quest France, 9 Décember 2009, 00h00
https://www.ouest-france.fr/normandie/calvados/grippe-dans-le-calvados-va-vacciner-hors-des-centres-618821

Alors que la ministre de la Santé Roselyne Bachelot milite toujours pour un rôle central des centres de vaccination dans la campagne contre la grippe A, la préfecture du Calvados entrouvre la porte aux propositions des médecins libéraux.

Très prochainement, les médecins libéraux qui le souhaitent pourront aller vacciner leurs patients ultraprioritaires à domicile ou sur leur lieu de séjour. Il pourrait s'agir d'insuffisants respiratoires, de handicapés, de personnes alitées ou ne pouvant se déplacer pour raisons de santé.

Équipes mobiles resserrées «Mieux vaut faire faire cela par les médecins qui connaissent leurs patients plutôt que de faire appel à des gens de l'extérieur» «d'équipes mobiles resserrées» «Ils rempliront le questionnaire de santé avant de venir chercher le nombre de vaccins nécessaires dans le centre le plus proche de leur cabinet»«la traçabilité du vaccin sera assurée».

H1N1: Vaccination à domicile... dans le Calvados

The Flu Case, 9 Décembre 2009, 06:54
https://web.archive.org/web/20100102024039/http://theflucase.com/index.php?option=com_content&view=article&id=2230%3Agps-in-calvados-came-give-jabs-to-some-patients-rules-prefect&catid=1%3Alatest-news&Itemid=64&lang=en

Selon Ouest-France, la préfecture du Calvados va autoriser les médecins libéraux à aller vacciner certains patients à domicile.

Depuis des semaines, les médecins libéraux réclament l'autorisation de vacciner à domicile. Ce sera bientôt possible pour certains, mais très localement. Selon Ouest France, la préfecture du Calvados va autoriser les médecins libéraux à aller vacciner certains patients à domicile. Il pourrait s'agir "d'insuffisants respiratoires, de handicapés, de personnes alitées ou ne pouvant se déplacer pour raisons de santé", avance le quotidien. "Mieux vaut faire faire cela par les médecins qui connaissent leurs patients plutôt que de faire appel à des gens de l'extérieur", explique le préfet dans Ouest France.

Cependant, les vaccinations à domicile seront soumises à de strictes conditions: chaque médecin devra communiquer sa liste de patients "prioritaires" à la préfecture et remplir un questionnaire de santé détaillé pour justifier ces exceptions. Ensuite, ils seront autorisés à venir chercher les vaccins dans les centres. Ces précautions seront prises, explique le préfet dans Ouest France, pour assure la traçabilité de la vaccination.

La semaine dernière, François Fillon avait réaffirmé mardi que les médecins libéraux n'effectueraient "pas de vaccination" massive contre la grippe H1N1 pour des "raisons logistiques". "Les vaccins sont des vaccins multidoses, ils ne peuvent pas être répartis dans n'importe quelles conditions", avait-t-il fait valoir.

Le H1N1 endommage les poumons

La grippe H1N1 endommage l'ensemble des voies respiratoires, de la trachée aux alvéoles pulmonaires, tout comme les virus qui ont causé les pandémies de grippe meurtrières de 1918 et 1957, selon une étude américaine publiée mardi. Des scientifiques de l'Institut national de la santé (National Institutes of Health) et des responsables de la santé de la ville de New York ont étudié au microscope des tissus provenant de 34 personnes décédées des suites de la grippe H1N1. Ils ont découvert "un éventail de lésions, aussi bien dans les voies respiratoires supérieures que dans les voies inférieures", a indiqué l'un des auteurs de l'étude parue dans l'édition en ligne de Archives of Pathology and laboratory Medicine. Dans l'ensemble des cas étudiés, la trachée et les bronches présentaient des signes d'inflammation et étaient parfois gravement endommagées. Dans 18 cas, soit plus de la moitié, des lésions ont été observées dans les bronchioles et dans 25 cas, soit près des trois-quarts de l'échantillon, jusque dans les alvéoles pulmonaires. L'étude met en évidence une nouvelle caractéristique affectant les trois-quarts des victimes: l'obésité. "L'obésité n'avait pas été identifiée lors des précédentes pandémies, et la nature du lien entre l'obésité et la grippe n'est pas claire", souligne cependant l'auteur.

GPs in Calvados came give jabs to some patients, rules Prefect

The Flu Case, 10 December 2009 13:11
https://web.archive.org/web/20100102024039/http://theflucase.com/index.php?option=com_content&view=article&id=2230%3Agps-in-calvados-came-give-jabs-to-some-patients-rules-prefect&catid=1%3Alatest-news&Itemid=64&lang=en

The Prefect of the department of Calvados in France is to allow doctors to give people in special cases of illness the swine flu jab in their practices against the wishes of the government, according to TF1. The GPs of Calvados are in the process of challenging requisition orders in the local courts.

Rue89

Grippe A: et si la vaccination était une cause de divorce?

Rue89, 9 Decembre 2009, 11:05
https://web.archive.org/web/20091213004503/http://www.rue89.com/2009/12/09/grippe-a-et-si-la-vaccination-etait-une-cause-de-divorce-129212

Se faire vacciner? Faire vacciner ses enfants? La question de la vaccination divise au sein du couple. Témoignages.

La chronique de Stéphane Guillon [1], ce mardi matin à la radio, en plus de me faire rire, m'a ouvert les oreilles sur une question de société peu évoquée: «Tous les couples qui ne mourront pas de la grippe A divorceront dans l'année.»

C'est vrai ça, que se passe-t-il lorsqu'un désaccord de cette taille surgit au sein d'un couple? Après avoir raillé Roselyne Bachelot, qui était l'invitée de la matinale de France Inter [2], l'humoriste décrit une scène de ménage. (Voir la vidéo à partir de 3 minutes 10)

«Même au sein de la famille, les gens ne sont pas d'accord. Le médecin de monsieur a dit oui mais la pédiatre des enfants a dit non…

- Très bien, quand ils auront 41°C, viens pas chialer, tu t'en voudras à mort…
- Je préfère qu'ils aient 41 plutôt qu'ils attrapent la sclérose en plaques…
- Qui t'as dit ces conneries?
- Brigitte a une copine…
- Brigitte?! Cette coooonne qu'est même pas capable d'avoir des enfants! Passe-moi le téléphone, je vais l'appeler…
- T'as jamais pu blairer mes copiiiiiiiines…

Bref, tous les couples qui ne mourront pas de la grippe A ou du vaccin divorceront dans l'année, c'est le seul effet secondaire dont on est certain. »

Entre parents d'élèves, entre parents et enfants et au sein du couple, la question a parfois des accents politiques. Puisque c'est la ministre de la Santé elle-même qui nous invite à nous faire vacciner [3], certains ont l'impression qu'ils seront comptés parmi les partisans de la politique gouvernementale s'ils prêtent leur bras.

Chez les enfants, les rumeurs vont bon train, et du coup il faut parfois une petite mise au point pour chasser leurs fantasmes.

S'en remettre aux scientifiques

L'envie de se faire vacciner varierait-elle avec les classes sociales ? Hervé, conseil en développement durable, raconte: «Dans nos milieux écolos, on a beau être des adeptes du principe de précaution, on est plutôt opposés à la vaccination. Pour nous, c'est évident que cette affaire de grippe est une blague énorme. D'ailleurs, dans les médias, on entend moins les sceptiques…»

Ceux qui comptent des scientifiques parmi leurs proches s'en remettent souvent à leurs avis. Flore témoigne: «Mon père est chercheur en biologie, dans son milieu tout le monde se fait vacciner, alors je l'ai fait et pour mes enfants aussi».

Et que se passe-t-il lorsque le débat coince? Au ministère de l'Education nationale, on précise que:
- pour la vaccination dans les collèges et lycées, qui a démarré le 25 novembre et doit durer jusqu'à Noël, les parents doivent signer le bon de vaccination et dire si oui ou non ils veulent se faire vacciner. Mais, de toutes façons, c'est eux qui décident [4];
- pour les écoliers, il n'y aura pas de passage dans les établissements. Les parents sont invités à se rendre dans les centres de vaccination collective. La présence d'une seule personne ayant autorité parentale suffit.

Théoriquement, un parent pourrait décider pour son enfant, sans en référer à l'autre. Il est rare d'en arriver là… même quand on est divorcé. Jean-Charles, divorcé et papa d'une fille de 9 ans, explique: «On a décidé de faire confiance au pédiatre. Lui a fait vacciner ses petits-enfants, donc on fera pareil».
«Face à une mère… je me sais perdant»

Chez Pascal, le pédiatre jugeait la vaccination des enfants pas très utile. Mais sa femme était pour:
«J'avais coché "non" sur le bon de vaccination du collège, elle a voulu aller le reprendre pour dire oui; entretemps notre fils a passé une soirée avec des copains dont l'un avait la grippe A, et lui ne l'a pas attrapé. Comme il avait eu un coup de fièvre un peu plus tôt, on s'est dit qu'il devait être immunisé.»

Les mères semblent plus favorables à la piqûre que les pères et, comme précise Bertrand qui est dans ce cas de figure: «Pour l'heure, je garde la main, mais face à une mère… je me sais perdant!»

Surtout, le penchant des Français à se faire vacciner varie avec l'annonce du nombre de morts (118 en métropole [5]). Chacun fait son rapport bénéfices/risques, avec une bonne dose d'irrationnel. Patrick, journaliste scientifique et père d'un garçon de 14 ans, raconte:
«Quand c'était la pointe de l'épidémie, il y a dix jours, sa mère voulait qu'on le fasse vacciner. Moi j'avais l'impression que s'il avait la grippe, ce ne serait pas grave. Je n'ai pas peur qu'il attrape une maladie rare, mais c'est toujours fatiguant un vaccin. Lui n'avait pas envie, ça a joué.

Des médecins disent qu'il vaudrait mieux se faire vacciner contre les infections à pneumocoques, avec le Pneumo 23 [6]».
Mais ce dernier est réservé aux personnes présentant des facteurs de risque. Et vous, la décision fait-elle consensus dans vos familles?

THE FLU CASE

French Comedian gets mileage out of Swine Flu hoax

The Flu Case, 10 December 2009, 12:59
https://web.archive.org/web/20100102053238/http://theflucase.com/index.php?option=com_content&view=article&id=2229%3Afrench-comedian-gets-mileage-out-of-swine-flu-hoax&catid=1%3Alatest-news&Itemid=64&lang=en

The issue of whether to get the swine flu jab or allow children to get the swine flu jab is dividing couples in France, according to Rue 89, but also providing jokes for commedians.

"All those couples who haven't died from the swine flu are going to get divorced this year," says comedian Stephane Guillon.

Guillon made waves this week in France for saying apparently as part of a comedy routine that a friend of his who has a biosafety lab 4 in the US had told him that monkeys given the swine flu jab in August died four months later.

Vaccination: les réquisitions encadrées

Les Echos, 9 Décembre 2009

https://web.archive.org/web/20091227095431/http://www.lesechos.fr/info/sante/020258893649.htm?xtor=RSS-2059

Déprogrammations. Devant les protestations des professionnels de santé, Roselyne Bachelot a précisé, hier, les conditions dans lesquelles les médecins et les infirmiers peuvent être réquisitionnés pour participer à la campagne de vaccination.

La mobilisation des internes et des étudiants en médecine se fera «sur la base des seules listes fournies par les établissements de santé», précise une circulaire envoyée aux préfets.

Les services hospitaliers déjà «en tension du fait de l'épidémie» (urgences, pédiatrie, réanimation, pneumologie, maladies infectieuses) ne seront plus sollicités.

Les réquisitions se limiteront à deux vacations de cinq heures par semaine. La rémunération des internes sera doublée le dimanche et en semaine après 18 heures (66 euros de l'heure au lieu de 33 euros), comme celle des élèves infirmiers.

Le délégué général de la Fédération hospitalière de France, Gérard Vincent, s'est voulu rassurant sur la période des fêtes, toujours difficile en raison des vacances du personnel. La déprogrammation d'activités non urgentes devrait «permettre de faire face», a-t-il dit.

French Nurses win a victory over Requisitions

The Flu Case, 10 December 2009 13:15

https://web.archive.org/web/20100102015230/http://theflucase.com/index.php?option=com_content&view=article&id=2231%3Afrench-nurses-win-a-victory-over-requisitions&catid=41%3Ahighlighted-news&Itemid=105&lang=en

French student nurses have won a victory in their battle to stop the government from compelling them to work seven days a week for up to 14 hours a day in swine flu vaccine centers.

French Health Minister Roselyne Bachelot has said students nurses cannot be requisitioned for more than ten hours a week or two sessions of five hours, according to Les Echos.

In addition, student nurses are to get better pay.

Students nurses last Saturday protested the conditions under which they were compelled to work in chaotic vaccine centers under the orders of bullying supervisors.

NEWS BBC

Swine flu victim's family plea over vaccinations

BBC, 10 December 2009, 17:52 GMT
http://news.bbc.co.uk/2/hi/uk_news/scotland/8406761.stm

The family of a woman who died from swine flu after giving birth have urged all pregnant women to get vaccinated against the virus.

Marianne Johnston, 20, who was from Clydebank in West Dunbartnoshire, is thought to have contracted H1N1 while she was pregnant with her son, Leon. Ms Johnston developed symptoms of swine flu after she returned home with her new baby.

The number of people with H1N1 fell last week from 12,300 to around 9,000.

Just days after leaving hospital and returning home to her partner William Laird and one-year-old son Jay, Ms Johnston was sent to Glasgow's Western Infirmary with swine flu like symptoms.

After her symptoms worsened, she was moved to the intensive care ward, where she was put on a ventilator. She was later transferred to London's Royal Brompton Hospital for specialist treatment, but died on November 29 after developing complications including deep vein thrombosis and bleeding on her brain.

Marianne Johnston's sister, Kirsty, said: "Think about people who have lost babies due to this and Marianne now has a child and my nephew does not have a mum. – "If they have any doubt just think about what can happen."

In a plea to all pregnant women, she added: "It is not just random, it is happening all over the place and don't take the chance with your own life or with your child, have the sore arm for two days, because I am sure if Marianne had the option now she would take the sore arm any day.

"I don't think that there would be any doubt in their minds."

Vaccine uptake

Figures from the Scottish government showed that only a quarter of people who are eligible for the swine flu vaccination have had it. Almost half of all NHS staff have had the vaccination.

The extent of vaccination uptake was revealed as the most recent figures showed another drop in the number of swine flu cases.

Health officials estimate that 8,900 people caught the virus in the past week, down from 12,300 over the previous seven days.

Health Secretary Nicola Sturgeon said: "It is encouraging to note a drop in the number of cases of flu-like illness again this week. – "As more people are vaccinated we should continue to see these numbers fall as immunity to H1N1 increases."

Vaccine uptake for pregnant women was 36.7%, while it was 33.2% for under-65s and 20.3% for over-65s, giving an average of 25.5% for the entire at-risk group. The estimated uptake rate for front-line health and social care staff was 45.7% and 29.5% respectively - both increases on the previous week.

Ms Sturgeon added: "We have seen all too often this year the tragic consequences of people developing complications from H1N1 and the best protection against this is vaccination. – "In particular, I would again urge pregnant women to come forward to be vaccinated. – "We know that pregnant women are more at risk of developing complications if they contract this illness and vaccination will protect not only them but their unborn baby. – "Health boards and GP surgeries are continuing to focus their efforts on getting pregnant women vaccinated to ensure that they are all offered the jab by Christmas."

U.S. almost ready to give swine flu shot to all (from Bloomberg)
70 Million doses of Swine Flu jabs delivered via undisclosed sites in USA

The Flu Case, Bloomberg, 10 December 2009, 11:53
https://web.archive.org/web/20100102031903/http://theflucase.com/index.php?option=com_content&view=article&id=2227%3A70-million-doses-of-swine-flu-jabs-delivered-via-undisclosed-sites-in-usa&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The U. S. is preparing to offer swine flu shots to everyone who wants one in the next few weeks, a Centers for Disease Control and Prevention official said Monday.

"We're at the stage now where vaccine will be available to most anyone who wants it," Anthony Fiore, associate chief of policy and liaison activities at the CDC's National Center for Immunization and Respiratory Diseases' Influenza Division, said in a presentation at the World Influenza Congress in Brussels.

The U. S., like other countries, is vaccinating people most at risk of contracting the illness first. These priority groups include pregnant women, people who have close contact with children under six months of age, who can't receive the vaccine, health workers, people aged six months to 24 years old and adults under 65 who have chronic medical conditions.

About 70 million doses of the shot have been shipped to state and local health authorities in the U. S., Fiore said in an interview. San Francisco-based McKesson Corp. is distributing the vaccine from manufacturers to four undisclosed sites and then on to 150,000 local sites, said Michael Angelastro of the U. S. Biomedical Advancement Research and Development Authority.

Fiore said the CDC expects to have estimates of the number of people who had received the vaccine in the U. S. in the next week or two. About 10 percent of older people and 10 percent of pregnant women have probably received the vaccine so far and about 20 percent of young children have probably had one of the two doses they need, he said.

Aiming Towards Better Health

Canada looking to share its Deadly Arepanrix Vaccine with other countries

Prevent Disease, 10 December 2009
https://web.archive.org/web/20100102180310/http://preventdisease.com/news/09/121109_Canada_to_share_deadly_arepanrix.shtml

Late last month, the Canadian federal government stated that it was to announce a decision on what to do with tens of millions of unused doses of the deadly Arepanrix H1N1 vaccine. Now, at the health detriment of other countries, Canada's chief public health officer has stated that the World Health Organization will begin putting the surplus doses to use.

Chief Public Health Officer Dr. David Butler-Jones said the Public Health Agency would talk with it's supplier about turning back unneeded vaccine so the company could start filling orders from other countries sooner.

Canada ordered 50.4 million doses of H1N1 vaccine, enough to give 75 percent of Canadians two doses apiece if two were required.

Up until now, Canadian authorities have steadfastly refused to discuss what they might do with the excess vaccine, saying they wanted to ensure Canada's needs were being met before crossing that bridge.

The World Health Organization (WHO) has also been promised more than 150 million doses by four vaccine manufacturers, including Canada's main supplier GlaxoSmithKline (GSK). A Canadian spokesperson had said it was not clear what form Canada's donation would take.

GSK had asked several provinces to set aside the 170,000 doses from the questionable batch they'd noticed a higher-than-usual number of allergic reactions from one batch. Dozens of Canadians have suffered severe allergic reactions while 200 others died from the vaccine.

However recently, Canada has communicated with WHO indicating it could share it surplus does of the H1N1 vaccine with other countries such as Vietnam.

In an urgent communication to WHO, Vietnam has demanded that all information about the Arepanrix H1N1 vaccines produced by the GlaxoSmithKline, including its dosage and the number of allergic reactions to it in other countries, be clearly stated, the health ministry’s Drug Administration said. The country is expected to receive 1.2 million does of vaccines produced by GlaxoSmithKline from the WHO this month.

A Canadian government spokesperson said it will be important to hold onto some additional supply, in case increased demand is triggered by future events that cannot be foreseen.

Vaccine researcher and Naturopathic Doctor, Dave Mihalovic stated that holding onto any additional H1N1 vaccine supply is useless. "The H1N1 virus has already mutated as verified by the WHO, so even based on rudimentary vaccine science (if that even exists), any vaccine developed by GSK six months ago would be completely ineffective against the current strain.

tagesschau.de

Schweinegrippe-Impfstoff soll teilweise verkauft warden

Tages Schau, 10 Decembre 2009.
https://web.archive.org/web/20091210195935/http://www.tagesschau.de/inland/schweinegrippe714.html

Weil sich weniger Deutsche als erwartet gegen die Schweinegrippe impfen lassen, wollen die Bundesländer Impfdosen an das Ausland verkaufen. Nach Angaben von Bundesgesundheitsminister Philip Rösler sollen 2,2 Millionen Einheiten anderen Ländern angeboten werden. Ein möglicher Kunde: die Ukraine. Die Impfdosen sollen in der letzten Dezember-Woche 2009 ausgeliefert werden.

Sechs Wochen nach Beginn der Immunisierungen hätten sich nur fünf Prozent der Bevölkerung impfen lassen, sagte Rösler nach dem zweiten Impfgipfel in Berlin. Selbst bei Ärzten und Pflegepersonal liege die Impfquote bei nur 15 Prozent.

Keine Entwarnung bei der Schweinegrippe

Gleichzeitig lehnte der Gesundheitsminister eine Entwarnung bei der Schweinegrippe ab. "Man kann noch nicht davon ausgehen, dass die Krankheit ihre Gefahr verloren hat", warnte er. Rösler appellierte erneut an Bevölkerung, Ärzte und Pflegepersonal, sich impfen zu lassen.

Auch Christoph Fuchs von der Bundesärztekammer warnte vor dem Virus. Selbst wenn die erste Welle der Erkrankungen inzwischen den Höhepunkt überschritten habe, könne es eine zweite Welle und eine Veränderung des Virus geben.

Rund 190.000 Menschen haben sich in Deutschland an der Schweinegrippe infiziert, sagte er. 86 von ihnen seien gestorben. Etwa 85 Prozent der Toten litten nach Angaben des Robert-Koch-Instituts bereits an Vorerkrankungen.

"Durch das Impfen hat es keinen einzigen Todesfall gegeben"

Bislang seien fünf bis sechs Millionen Menschen immunisiert worden, sagte Wolfram Hartmann vom Verband der Kinder- und Jugendärzte. "Bisher hat es durch das Impfen keinen einzigen Todesfall in Deutschland gegeben." Zwar verlaufe die Grippe wesentlich harmloser als befürchtet, doch empfehle er eine Impfung auch für Kinder ab dem sechsten Monat. "Auch wer bereits Grippesymptome hatte, sollte sich immunisieren lassen", sagte Hartmann.

Die Schweinegrippe befällt am häufigsten Kinder und junge Erwachsene bis zum Alter von 24 Jahren. Die Länder hatten 50 Millionen Impfdosen bestellt, die schrittweise bis zum Frühjahr ausgeliefert werden sollen. Das finanzielle Risiko für nicht verbrauchte Impfdosen liegt bei den Ländern.

THE FLU CASE

Ukraine to get Swine Flu jabs rejected by Germans

The Flu Case, 8 December 2009 15:11
https://web.archive.org/web/20100102033538/http://theflucase.com/index.php?option=com_content&view=article&id=2211%3Aukraine-to-get-swine-flu-jabs-rejected-by-germans&catid=1%3Alatest-news&Itemid=64&lang=en

The German government is planning to give swine flu vaccine to the Ukraine and other countries after less than 5 % of the people took the untested jab even by the government's own somewhat inflated estimates.

Only 15 % of doctors and health care workers took the jab.

Health Minister Philip Rösler has said that Ukraine could be the recipient of 2.2 million doses of the Pandemrix jab, classified as a bioweapon by EU and US regulators according to biopharma drug databases.

The Ukraine President Viktor Yushchenko last month implemented martial law and suspended presidential elections under the pretext of a pandemic emergency. Several regions have been put under quarantine and critics of the swine flu jab arrested as the Ukraine gears up for a mass vaccination campaign.

Soldiers get mass swine flu shots before holidays

GoUpstate // The Associated Press, 11 December 2009, 11:50 ET
https://www.goupstate.com/story/news/2009/12/11/soldiers-get-mass-swine-flu-shots-before-holidays/29807043007/

Specialist Ashley Vorhees, left, administers the H1N1 vaccine, to specialist Brandon Folden on Wednesday in the Solomon Center at the Army's Fort Jackson Training Center in Columbia.

Fort Jackson – Thousands of Army recruits in training must line up at least once more before heading home for the holidays, this time for mass inoculations by the hundreds against swine flu.

The Army's largest training camp, just outside Columbia, and other posts are hurrying to finish the shots before the year-end break. More than 40,000 soldiers in advanced and basic training across the country head home over the next two weeks in a massive troop movement known as "block leave," Army officials said.

"We have been very aggressive in trying to assure the safety of our soldiers," said Maj. Soo Hee Kim-Delio, the Army physician in charge of the inoculations at Fort Jackson. "Our basic training population is at particularly high risk."

Swine flu, also known as 2009 H1N1, has proved to be similar to seasonal flu but a bigger threat to children and young adults. Many of the trainees are in their late teens and early 20s.

The soldiers are also vulnerable because of the physical stress of basic training and from living at close quarters with hundreds of other recruits, Kim-Delio said. When they return home, they may rub shoulders with a host of relatives or be around children fresh from exposure at school.

Fort Jackson recorded the Army's first death from complications of swine flu when Spc. Christopher Hogg of Deltona, Fla., died Sept. 10 from pneumonia due to H1N1 influenza, authorities said.

Fort Jackson started the shots about two weeks ago and expects to vaccinate as many as 9,000 soldiers by the end of this week and another 2,000 by the middle of next week. The trainers who remain on post, the Army's medical work force, family members, pregnant women and those with certain medical conditions such as asthma also will get the shots for a total of about 15,000 doses, Kim-Delio said.

Spezielle Schweinegrippe-Impfung für Schwangere ab Mittwoch

AFP, Yahoo News, 11 Dezember 2009, 11:38 Uhr
https://web.archive.org/web/20091220203734/http://de.news.yahoo.com/2/20091211/twl-spezielle-schweinegrippe-impfung-fue-4bdc673.html

Schwangere können sich voraussichtlich vom kommenden Mittwoch an mit einem speziellen Impfstoff gegen die Schweinegrippe impfen lassen. Wenn es keine Verzögerungen gebe, stehe das Serum den Frauenärzten am kommenden Mittwoch zur Verfügung, sagte Andreas Hoffmeier vom Gesundheitsministerium Thüringen, das derzeit den Vorsitz in der Gesundheitsminister-Konferenz inne hat, dem "Westfalen-Blatt". Der Impfstoff der Firma CSL Biotherapies enthält keine umstrittenen Wirkverstärker und quecksilberhaltigen Konservierungsmittel.

Die Bundesländer hatten insgesamt 150.000 Dosen des Impfstoffes bestellt, nachdem die Ständige Impfkommission (Stiko) Schwangere als Risikogruppe eingestuft und für sie einen Impfstoff ohne Wirkverstärker empfohlen hatte. Der für die Allgemeinbevölkerung bestellte Impfstoff Pandemrix enthält verstärkende Zusätze, sogenannte Adjuvanzien, die den Impfstoff effektiver machen, aber auch zu stärkeren lokalen Nebenwirkungen führen können. Dies hatte zu heftigen Diskussionen geführt. Allerdings halten Experten eine Impfung mit Pandemrix bei gesundheitlich vorbelasteten Schwangeren durchaus für vertretbar.

Der nun ausgelieferte Impfstoff von CSL soll ein geringeres Risiko einer fiebrigen Infektion bergen. Empfohlen wird die Impfung für Schwangere nach dem ersten Schwangerschaftsdrittel. Nach den Statistiken gibt es in Deutschland jährlich rund 600.000 Schwangere. Die Länder rechnen aber damit, dass die 150.000 Dosen ausreichen, weil sich nicht alle impfen lassen werden.

Nach Angaben des "Westfalen-Blatts" ist die Zahl der Neuerkrankungen mit der Schweinegrippe weiter rückläufig. Bundesweit seien seit dem 18. Mai rund 195.000 Fälle von Neuer Grippe gemeldet worden, schreibt die Zeitung unter Berufung auf das Robert-Koch-Institut. Die meisten neuen Fälle (46.432) seien vom 16. bis 22. November gezählt worden. Vom 23. bis 29. November seien es nur noch 29.771 und vom 30. November bis 6. Dezember nur noch 11.582 neue Fälle gewesen.

German States order new Swine Flu jabs from CSL

The Flu Case, 11 December 2009
https://web.archive.org/web/20100102005120/http://theflucase.com/index.php?option=com_content&view=article&id=2238%3Agerman-states-order-new-swine-flu-jabs-from-csl&catid=1%3Alatest-news&Itemid=64&lang=en

Following protests among doctors and other government officials in Germany, women expecting babies are to be offered a swine flu vaccine without mercury and the adjuvant squalene made by CSL Biotherapies in Australia from Wednesday.

The federal states have ordered 150,000 doses of the jab that is allegedly safer than the untested Pandemrix and Focetria jabs, classified as biodefense stockpile drugs (bioweapons) by EU and US regulators according to the regulatory indices of biopharma databases.

THE FLU CASE

French Police Fetch Surgeons in Hospitals to work in Swine Flu jab centres

The Flu case, 11 December 2009, 10:12
https://web.archive.org/web/20100102033556/http://theflucase.com/index.php?option=com_content&view=article&id=2233%3Afrench-police-fetch-surgeons-in-hospitals-to-work-in-swine-flu-jab-centres&catid=1%3Alatest-news&Itemid=64&lang=en

The French government's requisition of health care workers to work in swine flu vaccine centres is disrupting the care of patients in hospitals, the president of the Paris Hospital Internist Union, Benjamin Chousterman, told AFP.

"The police come and look for internists in the hospital to take them to the vaccination centres," he said underlining the military character of the country's largest mass vaccination operation ever involving army medical corps teams.

A surgeon in the hospital Saint Joseph in Paris reported that he was ordered on Friday evening to work in a vaccine centre on Saturday at 3 pm at a time when he was scheduled to assist with an operation.

Only 30 % of the health workers in France have taken the untested jab in spite of intense government and media pressure. Tiny numbers volunteered to work in the centres, leading the government to implement compulsory service or requisitions.

2 million people in France have received the swine flu shot altogether, according to the government. This far lower than the government hoped for. In August, plans to vaccinate the entire population by the end of January were leaked.

This a report on unisfaceauvaccin.org

Les conditions de réquisition des internes dans le cadre de la campagne de vaccination contre la grippe A(H1N1) v ont donné lieu à quelques ratés ces derniers jours, à en croire les principaux intéressés.

Le Président du Syndicat des internes des hôpitaux de Paris (SIHP), Benjamin Chousterman, a jeté samedi un pavé dans la mare en déclarant à l'AFP que les réquisitions primant sur les gardes, l'opération risquait, par ricochet, de désorganiser l'offre de soins dans les hôpitaux. «La police va chercher des internes dans les hôpitaux pour les amener dans les centres de vaccination», s'indignait notamment Benjamin Chousterman. Toujours à l'AFP, un interne en chirurgie vasculaire de l'hôpital parisien Saint-Joseph, témoignait: «J'ai été prévenu hier soir [vendredi] par la direction de l'hôpital que je devais me présenter dans un centre de vaccination aujourd'hui [samedi] à 15 heures, alors que j'étais d'astreinte à l'hôpital. Un patient devait être opéré en urgence pour une ischémie, une artère de la jambe bouchée. On m'a quand même envoyé au centre de vaccination, en affectant un chirurgien viscéral pour aider le chirurgien senior pendant cette opération. C'est comme si on envoyait un plombier aider un serrurier. Du coup, s'il y a une péritonite ou une appendicite à opérer d'urgence, le chirurgien viscéral est occupé à déboucher une veine dans le service d'à côté».

Taiwan offers cabbages to get people to take swine flu vaccine

Prokeral // DPA, 12 December 2009, 21:02 IST
https://www.prokerala.com/news/articles/a99901.html

Taipei – Taiwan launched an island-wide H1N1 vaccination campaign on Saturday, offering cabbages and other small gifts to induce people to take the shot. More than half a million people took the vaccination shot on Saturday at 2,573 places designated by the Department of Health. They include hospitals, clinics, community centres, shopping malls, train stations and temples.

Some Taiwanese are reluctant to take the shot, fearing the vaccine is not safe.

To lure people to take the shot, the shopping malls and community centres gave the recipient a big green cabbage or a small gift, like a ruler or a rubber eraser.

Premier Wu Den-yi took the H1N1 vaccine shot Saturday. President Ma Ying-jeou took a shot of the locally-developed H1N1 vaccine last month.

Before Saturday, Taiwan had already vaccinated 2.6 million people who were categorized as priority groups - infant and children, students, patients, pregnant women and senior citizens.

Schweinegrippe: Patientin nach Impfung mit H1N1-Virus infiziert
"Ich war selbst erschrocken", sagt ihr Leipziger Arzt zu bild

BILD, 9 December 2009
https://www.bild.de/regional/leipzig/patientin-nach-impfung-mit-virus-infiziert-10755896.bild.html

Der Leipziger Allgemeinarzt Dr. Lothar Markus (60) berichtet jetzt erstmals von einem solchen Fall. Am 12. November habe er einer Patientin (39) eine Dosis des Schweinegrippe-Impfstoffs " Pandemrix" geimpft. 20 Tage später sei sie wieder in seine Praxis gekommen. Der Arzt: "Sie klagte über starke Kopf- und Gliederschmerzen, hatte 39,5 Grad Fieber. Typische Grippe-Symptome!"

Der Mediziner machte sofort einen Nasenabstrich und veranlasste einen H1N1-Test in der Virologie der Universität Leipzig. Das Ergebnis bekam er noch am gleichen Tag per Fax – es war positiv! Dr. Markus: "Ich war selbst erschrocken. Denn das bedeutet, dass eine mit Pandemrix geimpfte Person nicht vor dem Virus H1N1 gefeit ist."

Ralph Schreiber, Sprecher des Sächsischen Gesundheitsministeriums, vermutet eine unglückliche Zeitüberschneidung: "Die Immunität ist erst drei Wochen nach einer Impfung richtig aufgebaut, vermutlich hat sich die Patientin vorher angesteckt."

Damit will sich Dr. Markus nicht zufrieden geben. "Viele Schweinegrippe-Erkrankungen werden nicht erkannt, weil Ärzte nach einer Impfung keine Infektion vermuten", befürchtet er und fordert jetzt in einem Schreiben an das Robert-Koch-Institut (RKI), die Wirksamkeit von Pandemrix zu prüfen: "Möglich, dass eine einmalige Impfung nicht reicht."

RKI-Sprecherin Susanne Glasmacher: "Solche Fälle sind durchaus denkbar. Kein Medikament ist einhundertprozentig wirksam."

THE FLU CASE

Woman gets Swine Flu after pandemrix jab

The Flu Case, 15 December 2009
https://web.archive.org/web/20100102031801/http://theflucase.com/index.php?option=com_content&view=article&id=2300%3Awoman-gets-swine-flu-after-pandemrix-jab&catid=1%3Alatest-news&Itemid=64&lang=en

A woman in Germany who got the Pandemrix swine flu jab developed swine flu 20 days later.
The woman developed severe head ache, a 39.5 degree fever and aches in her limbs. Her doctor Dr Lothar Markus sent a sample to the virology lab in the University of Leipzig, which reported that the 39-year-old woman had developed swine flu.
It is not clear whether the vaccine was the cause of the woman getting the swine flu virus.

French Nurses threatened with Fines and Imprisonment over illegal requisition refusal

The Flu Case, 14 December 2009, 13:43
https://web.archive.org/web/20100102044056/http://theflucase.com/index.php?option=com_content&view=article&id=2280%3Afrench-nurses-threatened-with-fines-and-imprisonment-over-illegal-requisition-refusal-&catid=1%3Alatest-news&Itemid=64&lang=en

French nurses, including students, are being threatened with fines, imprisonment and even the closure of their schools if they do not work in the special swine flu vaccine centers, reports unisface-auvaccins.org.

The nurses are not being given the "requisition" order in written form as is required by the law as the government appears to be seeking to erase evidence of coercion.

Without this formal requisition request, nurses and students cannot be fined or imprisoned for a refusal because they have not technically been requisitioned in the first place.

This is email explaining one nurses' plight:

"A friend of mine, a nurse who has been requisitioned, told me she would have had to pay about 3600 € if she refused to go, so she went, and tried to just be on the reception desk rather than active. Apparently, this fine of 3600€ is payable each time they requisition her, so she will be going again next week as well. She is desperate, and many of her colleagues are as well. However, for the moment, they are just on a list, and have not had a "requisition paper" in their hand with the fine written on it. So in fact, there is no proof they are being threatened with the fine, nothing written, just oral pressure "fine/prison etc". She knows that if she doesn't comply, she will have to pay the fine, whereas she has never received the formal paper informing her of the requisition. Perhaps this is deliberate so there is no trace of the coercion," emails Carolyn from Paris.

Seoul to spend $15 million on flu aid to N. Korea

Yahoo, AFP, 14 December 2009, 09:58 am
https://web.archive.org/web/20091217190354/http://uk.news.yahoo.com/18/20091214/thl-seoul-to-spend-15-million-on-flu-aid-96993ab.html

The unification ministry, which handles cross-border ties, said the shipment would include antiviral drugs for 500,000 patients – Tamiflu for 400,000 and Relenza for 100,000 – and sanitation supplies.

The aid will cost an estimated 17.8 billion won (15.3 million dollars), which will be financed by a state fund for inter-Korean cooperation, it said.

Spokesman Chun Hae-Sung said Seoul would send the shipment as soon as possible, and definitely by the end of the year. But the North, which had accepted the offer, had not yet set a firm date.

The drugs shipment will be the first direct South Korean government aid since relations soured last year, although Seoul has funded assistance to Pyongyang through private groups.

North Korea Wednesday reported nine cases of (A)H1N1 in the capital Pyongyang and the city of Sinuiju bordering China. No death toll was given.

Observers say the virus could pose a particular threat to the North because of malnutrition amid persistent food shortages and a lack of drugs such as Tamiflu.

Good Friends, a Seoul-based welfare group with cross-border contacts, quoted an unidentified Sinuiju city official as saying more than 40 people had died of the swine flu in the border city alone.

The World Health Organization, however, told Yonhap news agency that all nine North Korean patients have recovered.

Yonhap quoted Suzanne Westman, coordinator of outbreak alert and response at the WHO's New Delhi office, as saying no additional cases were reported in the isolated communist country.

The first of the patients, all children aged between 11 and 14, was discovered on November 25 and the last case on December 4, she said, adding that three of the infections were in Pyongyang with the other six in Sinuiju.

"All contacts have been identified, put in isolation and treated," she told Yonhap, adding that North Korea had a solid surveillance system and a sufficient number of physicians is believed to be able to handle the outbreak.

Dr. Russell Blaylock

Forced Vaccinations, Government, and the Public Interest

The National Health Federation, 15 December 2009, 17:29
https://web.archive.org/web/20100102030952/http://www.thenhf.com/vaccinations/vac_299.htm

Those who are observant have noticed a dangerous trend in the United States, as well as worldwide, and that is the resorting of various governments at different levels to mandating forced vaccination upon the public at large. My State of Mississippi has one of the most-restrictive vaccine-exemption laws in the United States, where exemptions are allowed only upon medical recommendation. Ironically, this is only on paper, as many have had as many as three physicians, some experts in neurological damage caused by vaccines, provide written calls for exemption, only to be turned down by the State's public-health officer.

Worse are the States, such as Massachusetts, New Jersey and Maryland, where forced vaccinations have either been mandated by the courts, the state legislature, or have such legislation pending. All of such policies strongly resemble those policies found in National Socialist empires, Stalinist countries, or Communist China.

When public-health officers are asked for the legal justification for such draconian measures as forcing people to accept vaccines that they deem either a clear and present danger to themselves and their loved ones or have had personal experience with serious adverse reactions to such vaccines, they usually resort to the need to protect the public.

One quickly concludes that if the vaccines are as effective as being touted by the public-health officials, then why should one fear the unvaccinated? Obviously the vaccinated would have at least 95% protection. This question puts them in a very difficult position. Their usual response is that a "small" percentage of the vaccinated will not have sufficient protection and would still be at risk. Now, if they admit what the literature shows, that vaccine failure rates are much higher than the 5% they claim, they must face the next obvious question – then why should anyone take the vaccine if there is a significant chance it will not protect?

When pressed further, they then resort to their favorite justification, the Holy Grail of the vaccine proponents – herd immunity. This concept is based upon the idea that 95% (and some now say 100%) of the population must be vaccinated to prevent an epidemic. The percentages needing vaccination grows progressively. I pondered this question for some time before the answer hit me. Herd immunity is mostly a myth and applies only to natural immunity – that is, contracting the infection itself.

Is Herd Immunity Real?

In the original description of herd immunity, the protection to the population at large occurred only if people contracted the infections naturally. The reason for this is that naturally-acquired immunity lasts for a lifetime. The vaccine proponents quickly latched onto this concept and applied it to vaccine-induced immunity. But, there was one major problem – vaccine-induced immunity lasted for only a relatively short period, from 2 to 10 years at most, and then this applies only to humoral immunity. This is why they began, silently, to suggest boosters for most vaccines, even the common childhood infections such as chickenpox, measles, mumps, and rubella.

Then they discovered an even greater problem, the boosters were lasting for only 2 years or less. This is why we are now seeing mandates that youth entering colleges have multiple vaccines, even those which they insisted gave lifelong immunity, such as the MMR. The same is being suggested for full-grown adults. Ironically, no one in the media or medical field is asking what is going on. They just accept that it must be done.

That vaccine-induced herd immunity is mostly myth can be proven quite simply. When I was in medical school, we were taught that all of the childhood vaccines lasted a lifetime. This thinking existed for over 70 years. It was not until relatively recently that it was discovered that most of these vaccines lost their effectiveness 2 to 10 years after being given. What this means is that at least half the population, that is the baby boomers, have had no vaccine-induced immunity against any of these diseases for which they had been vaccinated very early in life. In essence, at least 50% or more of the population was unprotected for decades.

If we listen to present-day wisdom, we are all at risk of resurgent massive epidemics should the vaccination rate fall below 95%. Yet, we have all lived for at least 30 to 40 years with 50% or less of the population having vaccine protection. That is, herd immunity has not existed in this country for many decades and no resurgent epidemics have occurred. Vaccine-induced herd immunity is a lie used to frighten doctors, public-health officials, other medical personnel, and the public into accepting vaccinations.

When we examine the scientific literature, we find that for many of the vaccines protective immunity was 30 to 40%, meaning that 70% to 60% of the public has been without vaccine protection. Again, this would mean that with a 30% to 40% vaccine-effectiveness rate combined with the fact that most people lost their immune protection within 2 to 10 year of being vaccinated, most of us were without the magical 95% number needed for herd immunity. This is why vaccine defenders insist the vaccines have 95% effectiveness rates.

Without the mantra of herd immunity, these public-health officials would not be able to justify forced mass vaccinations. I usually give the physicians who question my statement that herd immunity is a myth a simple example. When I was a medical student almost 40 years ago, it was taught that the tetanus vaccine would last a lifetime. Then 30 years after it had been mandated, we discovered that its protection lasted no more than 10 years. Then, I ask my doubting physician if he or she has ever seen a case of tetanus? Most have not. I then tell them to look at the yearly data on tetanus infections – one sees no rise in tetanus cases. The same can be said for measles, mumps, and other childhood infections. It was, and still is, all a myth.

The entire case for forced mass vaccination rest upon this myth and it is important that we demonstrate the falsity of this idea. Neil Z. Miller, in his latest book *The Vaccine Information Manual*, provides compelling evidence that *herd immunity is a myth*.

The Road to Hell is Paved with Good Intentions

Those pushing mandatory vaccination for an ever-growing list of diseases are a mixed bag. Some are quite sincere and truly want to improve the health of the United States. They believe the vaccine-induced herd immunity myth and likewise believe that vaccines are basically effective and safe. These are not the evil people.

A growing number are made of those with a collectivist worldview and see themselves as a core of elite wise men and women who should tell the rest of us what we should do in all aspects of our lives. They see us as ignorant cattle, who are unable to understand the virtues of their plan for America and the World. Like children, we must be made to take our medicine – since, in their view, we have no concept of the true benefit of the bad-tasting medicine we are to be fed.

I have also found that *a small number of people in the regulatory agencies and public health departments would like to speak out but are so intimidated and threatened with dismissal or destruction of their careers, that they remain silent*. As for the media, they are absolutely clueless.

I have found that "reporters" (we have few real journalists these days) rarely understand what they are reporting on and always trust and rely upon people in positions of official power, even if those people are unqualified to speak on the subject. Most of the time they run to the Centers for Disease Control or medical university to seek answers. I cannot count the number of times I have seen university department heads interviewed when it was obvious they had no clue as to the subject being discussed. Few such professors will pass up an opportunity to appear on camera or be quoted in a newspaper.

One must also appreciate that such reporters and editors are under an enormous economic strain, as vaccine manufacturers are major advertisers in all media outlets and for an obvious reason – it controls content. A number of excellent stories on such medical subjects are spiked every day. That means we will always be relegated to the "fringe media" as our media outlets are called. Despite the high quality of the journalism in many of the "fringe" outlets, they have a much smaller audience. And despite this we are having an enormous effect on the debate.

As the Public Awakens, the Collectivist Becomes Desperate

John Jewkes, in his book *Ordeal by Planning*, observed that as the British collectivists began to see opposition rise to their grandiose plans, they became more desperate and aggressive in their reaction. They then initiated a campaign of smearing their opponents and blaming every failure on the unwillingness of the people to accept the planner's dictates without question. We certainly have seen this in this debate –opponents to forced vaccinations are referred to as fringe scientists, kooks, uneducated, confused, and enemies of public safety – reminiscent of Stalin's favorite phrase, "enemy of the people."

This desperation is based upon their fear that the public might soon catch on to the fact that the entire vaccine program is based upon nonsense, fear, and concocted fairy tales. One special fear of theirs is that the public might discover the fact that most vaccines are contaminated with a number of known and yet-to-be discovered viruses, bacteria, viral fragments, and DNA/RNA fragments. And, further, that our science demonstrates that these contaminants could lead to a number of slowly-developing degenerative diseases, including degenerative diseases of the brain. *This is rarely discussed but is of major importance in this debate*.

The idea that adults and their children would be forced to submit to being injected with dozens of these organisms and organic fragments is terrifying. *No regulatory agency is tracking to see if chronic diseases are rising in the vaccinated*, yet we have compelling evidence of a massive rise in all autoimmune diseases, neurodegenerative diseases, and certain cancers since the advent of a dramatic increase in the number of vaccines being mandated.

Of special concern is the finding that many of the contaminant organisms can pass from generation to generation. For example, new studies have found that SV-40, a major contaminant of the polio vaccine until 1963, not only existed as a latent virus for the lifetime of those exposed to the vaccine but was being passed on to the next generation, primarily by way of sperm, something called vertical transmission. This means that every generation from now on will be infected with this known carcinogenic virus. There is also compelling evidence that some polio vaccines manufactured after 1963 may contain SV-40 virus.

What makes the SV-40 contamination disaster of such concern is its association with so many cancers – including mesothelioma, medulloblastoma, ependymoma, meningioma, astrocytoma, oligodendroglioma, pituitary adenoma, glioblastoma, osteosarcomas, non-Hodgkins lymphoma, papillary thyroid carcinomas, and anaplastic thyroid carcinomas.

The Federal government has gone to enormous links to cover up this association, despite the powerful scientific evidence that this vaccine infected at least a hundred million people worldwide with this carcinogenic virus. And, it took over 40 years just to get this far. Linking vaccine contami-nations and immunoexcitotoxicity to the drastic rise in neurodegenerative diseases will probably

take even longer because of the widespread growth of entrenched powers high in government and their control of the media, which is equally extensive. The fact that powerful, enormously wealthy foundations, such as the Ford Foundation, Bill and Melinda Gates Foundation, and Rockefeller series of foundations, *are supporting forced vaccination greatly enhances the power of governments* all over the World.

These foundations operate in the shadows, influencing legislation and government actions through the World Health Organization and individual governmental bodies. Behind every call for forced vaccinations, mandated quarantines, and home invasions, one can find one of these foundations providing the money as well as experts. Remember, the largest of the pharmaceutical-vaccine manufacturers are also providing much of the money for the foundations and serving on the boards of these foundations. The Rockefellers either owned outright or had controlling interest in all of the major pharmaceutical companies. This has given them absolute and extremely powerful access to the reins of power at all levels. Yet, they can be defeated by the truth.

Sanofi aims to double vaccine sales by 2013

Reuters, 17 December 2009, 10:59 PM GMT+8
https://www.reuters.com/article/idUSLDE5BG1RT20091217/

PARIS, Dec 17 (Reuters) – French drugmaker Sanofi-Aventis SA aims to double sales at its Sanofi Pasteur vaccines business by 2013, compared to the 2008 level, and reiterated it could make acquisitions in this fast-growing area.

Sanofi-Aventis raised its outlook for 2009 earlier this year due to rising sales of swine flu shots.

It forecast that H1N1 vaccines would add about $500 million to its sales in the fourth quarter of this year and indicated sales would continue "at a similar rate" until into the first quarter of 2010.

Sanofi said in an investor presentation on Thursday that it was targeting 4 billion euros ($5.76 billion) of net sales, including sales of the H1N1 swine flu vaccine, for 2010 for the vaccines business.

Sanofi Pasteur's vaccines offer protection against diseases such as flu, cholera and whooping cough.

Its rivals include the likes of GlaxoSmithKline, Wyeth and Novartis.

Sanofi-Aventis shares were down 0.7 percent at 53.88 euros in mid-afternoon trade, with France's benchmark CAC-40 index <.FCHI> down about 1 percent. ($1=.6942 Euro)

World Health Organization

Pandemic (H1N1) 2009 vaccine deployment update

Geneva, WHO, 17 December 2009

https://reliefweb.int/report/afghanistan/pandemic-h1n1-2009-vaccine-deployment-update-17-dec-2009

Background information

To help countries protect people from developing severe disease from pandemic influenza H1N1 infection, the World Health Organization (WHO) is coordinating the distribution of donated pandemic influenza vaccine to 95 countries. These countries were identified based on their vulnerability to pandemic influenza and their readiness and ability to use the vaccine for priority populations. WHO is working with UN and country partners to facilitate the distribution of the vaccine.

Mobilizing resources

Governments, foundations and manufacturers have offered contributions of vaccines, ancillary products (such as syringes, vaccine vial monitors and safety boxes) and finances to support the donation initiative.

Current situation

WHO has received pledges of nearly 180 million doses of vaccine, 75 million syringes and US$ 67 million for vaccine deployment.

Roselyne Bachelot assignée en référé le 4 janvier 2009 au TGI de Paris

Écrit par Flash-info-WLS, 17 Décembre 2009
https://web.archive.org/web/20091226035507/http://www.webtelelibre.levillage.org/index.php?option=com_content&task=view&id=2096&Itemid=40

Madame Roselyne Bachelot, Ministre de la Santé, a reçu vendredi dernier une assignation à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier prochain à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Cette procédure judiciaire a été engagé, devant le « danger imminent » encouru par la population, par l'Association Cri-Vie (Coordination de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées-Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue, ont engagé.

Dans un climat de psychose entretenue par certains experts avec la dramatisation de «quelques morts spectaculaires» (selon le Pr Daniel Floret), les français subissent la promotion commerciale du Tamiflu – source de résistances et de détresse respiratoire aiguë – et celle des vaccins pandémiques hautement toxiques dont l'autorisation de mise sur le marché a été accordée trop rapidement malgré la notion de plusieurs hépatites auto-immunes sur les 400 enfants testés et de nombreuses maladies auto-immunes chez l'adulte en rapport avec le squalène (rapports de la FDA, février 2009 et de l'Agence européenne du médicament: EMEA). Malgré une sous-notification importante, le premier bilan de l'EMEA du 17 novembre fait d'ailleurs état de 55 décès après la vaccination de 5,7 millions de personnes, alors que les autorités s'attendaient à 5,75 décès pour 10 millions de vaccinés. Ce rapport bénéfice/risques déjà défavorable – à court terme – le sera beaucoup plus avec le déclenchement à moyen et à long terme de troubles neuropsychiques (Autisme, hyperactivité…) et «de dizaines de milliers de pathologies auto-immunes, imputées ou non au vaccin, comme les scléroses en plaques (SEP) avec le vaccin hépatite B» (Pr Marchou, CHU Toulouse). Entre 1994 et 2008, la fréquence des seules SEP était passée de 20 000 à 83 000 cas.

Alors qu'elle n'était intervenue que plusieurs années après la survenue des scandales passés, la justice française a l'opportunité de suspendre cette vaccination inefficace ainsi que l'utilisation des antiviraux avant qu'un collège d'experts indépendants n'évalue les réels effets du Tamiflu et de ces vaccins et ne propose des moyens simples et sains de prévention et d'accompagnement de la grippe.

Notre justice ne peut davantage ignorer que l'OMS, les officiels de Santé Publique et les compagnies pharmaceutiques ont construit une machine mondiale de propagande au sujet de pandémies imminentes. Mme Chan, directrice de l'OMS, a ainsi déclaré l'alerte pandémique de niveau 6 en suivant les conseils éclairés d'experts inféodés aux lobbies pharmaceutiques. C'est le cas des Prs Bruno Lina, président en France du GEIG, financé à 100% par les fabricants de vaccins contre la grippe et Osterhaus, conseiller en chef pour les questions de virus pour le gouvernement Britannique et Hollandais,expert-clé du SAGE (Strategic Advisory Group of Experts Président du European Scientific Working group on Influenza (ESWI) financé exclusivement par les géants pharmaceutiques, fabricants de vaccins.

Tandis que la Pologne a refusé de commander de tels vaccins, Igor Barinov, Président de la Duma a, de son côté, interpellé l'ambassadeur russe auprès de l'OMS à Genève pour qu'une enquête officielle soit lancée concernant les témoignages et preuves de corruption massive au sein de l'OMS. Il a demandé qu'une investigation fasse la lumière sur les liens financiers entre les experts de l'OMS en charge de la pandémie grippale et les firmes pharmaceutiques. Si la corruption est établie, la Russie envisage de se retirer de l'OMS. « Il est urgent qu'une commission internationale d'enquête puisse être mise sur pied, a-t-il déclaré. (Der Spiegel, 12/12/09)

Les auteurs de l'assignation et leurs avocats Maîtres Malika Ouarti (Barreau de Paris) et Jean-Pierre Joseph (Barreau de Grenoble) invitent journalistes et citoyens à assister en nombre à cette audience publique de référé qui se tiendra le lundi 4 janvier à 9 h du matin, au TGI de Paris, 4 bd du Palais (75001 PARIS), au cabinet du vice-président Emmanuel Binoche, avec les avocats des parties.

THE FLU CASE

French Health Minister receives court summons over mass Swine Flu Vaccinations

The Flu Case, 18 December 2009, 13:08
https://web.archive.org/web/20100102010134/http://theflucase.com/index.php?option=com_content&view=article&id=2337%3Afrench-health-minister-receives-court-summons-over-mass-swine-flu-vacinnations&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Roselyne Bachelot, the French Minister of Health was summoned on Friday last week to attend a hearing at the Superior Court in January as part of legal action to put an end the swine flu mass vaccination campaign launched by lawyers Malika Ouarti (Barreau de Paris) and Jean-Pierre Joseph (Barreau de Grenoble), according to local media reports.

The hearing will take place on Monday, January 4 at 9 am at the Tribunal de Grande Instance of Paris.

Bachelot, who worked for at least 12 years in the pharmaceutical industry, has played a key role in planning and executing the mass swine flu vaccination campaign in France.

Specifically, Bachelot was involved in the detailed planning to set up 1,100 special vaccination centers around the country, excluding GPs, for the vaccination of the entire population by the end of January 2010.

Also, she sanctioned a secret contract with pharmaceutical companies, giving them blanket immunity from any legal action in the event of their untested jabs causing death or damage.

CTV NEWS

WHO to send swine flu vaccine to poor countries

CTV News, The Associated Press, 17 December 2009
https://www.ctvnews.ca/who-to-send-swine-flu-vaccine-to-poor-countries-1.465422?cache=xnyereiqqn%3FclipId%3D89680

London - The World Health Organization plans to start shipping swine flu vaccine to Azerbaijan, Afghanistan and Mongolia in the next few weeks, flu chief Keiji Fukuda said Thursday.

Another 32 developing countries are in line to get the vaccine soon. The U.N. health agency has prioritized sending the shots to northern hemisphere countries first, which are being hit harder by swine flu than countries in the southern hemisphere.

The agency had hoped to send the vaccine earlier, but the effort has been delayed by manufacturing problems and bureaucracy.

When WHO declared swine flu to be a pandemic, or global outbreak, in June, it warned the virus could have a devastating impact in countries across Africa with high numbers of people with health problems like malnutrition, AIDS, and malaria. Most people who catch swine flu only have mild symptoms like a fever or cough and recover without needing medical treatment.

WHO has a stockpile of about 180 million swine flu shots, donated by six drug makers and a dozen countries.

Countries hoping to get swine flu vaccine from WHO must meet three conditions. They have to formally ask for it, agree to certain terms and conditions on how it will be used, and develop a national plan to make sure the right people – like health workers and those with underlying health problems – get it first. WHO is hoping to send enough swine flu vaccine to cover about 10 per cent of populations in poor countries.

Countries likely won't start vaccinating their populations until a few weeks after they receive the vaccine, but Fukuda said it wasn't too late to ship the vaccine -- even though swine flu appears to have peaked in several northern hemisphere countries, like Britain and the U.S.

"This is a virus that we don't expect to suddenly disappear," Fukuda said, adding WHO expected the virus to keep circulating for the next few years.

Fukuda said it was "premature" to consider whether the pandemic might be on the decline, and that WHO would consult experts before making such a declaration. He said flu activity this year had peaked "extraordinarily early" and warned there were still several months of winter to come.

REUTERS

Swiss plan to donate, sell on swine flu vaccines

Reuters, 18 December 2009, 7:21 PM GMT+8
https://www.reuters.com/article/flu-swiss-idUSLDE5BH0X320091218/

Zurich, Dec 18 (Reuters) - Switzerland plans to donate or sell some 4.5 million excess doses of the swine flu vaccine due to the low uptake of shots, the government said.

Germany and Spain have also said they want to reduce deliveries of swine flu vaccine and potentially return excess supplies to manufacturers, which could hit drugmakers' profits.

"As not every person needs two doses, about 4.5 million of the purchased vaccine doses will be given up. Some of these would be donated to the WHO and others sold on to other countries," the Swiss government said in a statement.

The country would still have enough doses to protect the population in the event of a fresh wave of the H1N1 swine flu pandemic, it added.

Switzerland, whose total population is 7.7 million, ordered 13 million doses of vaccine from GlaxoSmithKline and Novartis .

CDC Identifies Racial Minorities as High Risk for H1N1 complications

Kake 10, 18 December 2009, 15:29
https://web.archive.org/web/20091221182304/http://www.kake.com/world/headlines/79612512.html

The U.S. Centers for Disease Control and Prevention (CDC) has named groups of people that are at a high risk of developing serious complications from H1N1 Influenza. In keeping with the last three subpopulation releases, which focused on pregnant women, breastfeeding moms, and those who smoke, the Sedgwick County Health Department will continue to send monthly releases focused on different subgroups.

Currently, one of the highest priority groups consists of persons with chronic health conditions. For various reasons, racial minorities tend to have more cases of these health conditions, including diabetes and heart disease. Diseases such as asthma, lung disease, diabetes and other conditions affect the immune and respiratory systems. Individuals with these conditions are therefore more likely to develop severe complications from H1N1. Latinos, Hispanics and African Americans have a higher rate of these underlying conditions and are therefore at a higher risk of life-threatening flu complications.

One of the most common underlying health conditions that can lead to complications from the flu is asthma. According to the Environmental Protection Agency (EPA), African Americans visit the emergency department for asthma 350 percent more often than Caucasians, are hospitalized for asthma 240 percent more often than Caucasians and die from asthma 200 percent more often than Caucasians. Puerto Ricans also are disproportionately affected by asthma: Puerto Ricans have asthma 125 percent more often than Caucasians and 80 percent more often than African Americans. Puerto Ricans also have the highest rate of asthma attacks.

The best way to protect oneself from H1N1 is to receive the vaccine. The Sedgwick County Health Department is currently offering vaccine to anyone who wishes to receive it at the Health Department's H1N1 Vaccine Clinic (4095 E. Harry). So far, disproportionately low numbers of minorities have visited the H1N1 Vaccine Clinic. The Health Department encourages everyone, including minorities, who may have an underlying health condition to receive the vaccine. The vaccine is FREE of charge.

WHO to Distribute 180 Million soft Killer Vaccines in Developping Countries

The Flu Case, 18 December 2009 12:17
https://web.archive.org/web/20100202014520/http://theflucase.com/index.php?option=com_content&view=article&id=2330:who-to-distribute-180-million-soft-killer-vaccines-in-developping-countries&catid=1:latest-news&Itemid=64&lang=en

Governments, foundations and manufacturers have offered toxic and untested swine flu vaccines and syringes to WHO for distribution to developping countries.
http://www.who.int/csr/disease/swineflu/vaccines/

180 million vaccines that have been donated by six vaccine manufacturers and the government of 12 countries to WHO.

WHO plans to distribute these to 95 developping countries in the next few weeks with Azerbaijan, Afghanistan and Mongolia, the first in line, to be followed by around 32 other countries in the "Northern Hemisphere".

THE FLU CASE

Finnish Government now "Predicts"
virulent virus between April and next Autumn

The Flu Case, 18 December 2009, 12:21
https://web.archive.org/web/20100220010818/http://www.theflucase.com/index.php?option=com_content&view=article&id=2331%3Afinnish-government-now-qpredictsq-virulent-virus-between-april-and-next-autumn&catid=1%3Alatest-news&Itemid=64&lang=en

This summer WHO and governments around the world were maintaining that a second wave with a virulent swine flu virus would appear in autumn of 2009 when an unprecedented global, mass vaccination campaign with untested swine flu jabs was supposed to be in full swing.

Now governments such as the one in Finland have mysteriously revised their predictions and say the appearance of this virulent virus cannot be expected until April to autumn next year.

How can this "error" be accounted for if we are really dealing with a virus that mutates according to scientific laws?

The only factor that has changed since summer is the unexpectedly low turn out for the swine flu vaccine throwing government plans into disarray.

Experts such as Dr Rebecca Carley have presented evidence to show said that the vaccine will generate a pandemic as happened with the Spanish Flu Pandemic of 1918-1919 when countries which did not mass vaccinate such as Greece had no Spanish Flu deaths.

The Finnish government even admits there is a causal relation between the "impact of the virus in the community" and the "proportion of those immunized against H1N1" in its statement.

Flu pandemic may change US flu approach forever

Reuters, 18 December 2009, 6:51 AM GMT+8
https://www.reuters.com/article/idUSN17190692/

Washington, Dec 17 (Reuters) - The swine flu pandemic may have changed the U.S. approach to handling influenza forever, and for the better, U.S. officials said on Thursday.

While they said years of work were needed before vaccine production was up to the desired standard, some experiments such as vaccinating children in schools might work to help control seasonal influenza.

But there are still holes in the public health system that will take years to patch, and communication with the public could use a bit more polishing, they acknowledged.

– "We still don't have the domestic capacity to make as much (flu vaccine) as we need as fast as we need it," Nicole Lurie, assistant secretary for preparedness and response at the Health and Human Services Department, told a news conference.

She said HHS had been forced by the H1N1 pandemic to work closely with state and local health officials to monitor the virus and deploy drugs and vaccines.

– "I actually think our nation's preparedness, our seasonal flu efforts and so on, will never be the same," Lurie said.

HHS Secretary Kathleen Sebelius said 100 million H1N1 vaccines will have been delivered or would be ready for order by the end of the week. She urged Americans to get vaccinated now and said everyone, not just people on the priority lists, should feel free to get one.

– "This is a serious flu that targets people who normally don't get seriously ill from the flu," Sebelius told the news conference.

"We have a chance to lessen the impact or even prevent a big third wave ... and we need to seize this opportunity right now," she said.

The U.S. Centers for Disease Control and Prevention estimates that 47 million Americans have been infected with H1N1, nearly 10,000 have been killed by it and more than 200,000 hospitalized.

Ebbing Second Wave

"The number of children and young adults killed by mid-November was five times more than in the average flu season," CDC Director Dr. Thomas Frieden said. – "We have an ebbing second wave but we have an uncertain future."

School vaccinations have worked well and CDC may press to keep the programs for seasonal influenza, Frieden said.

– "Not only will vaccinating kids in school reduce the number of kids who get sick ... but may well also tamp down the spread of flu in a community," he said.

But Frieden fretted about losses to public health. The CDC reported that in 2009, 10 percent fewer epidemiologists were working in state health departments than in 2006. Those specialists in the spread and pattern of disease are key to keeping track of viruses like flu, Frieden said.

"This virus was undoubtedly circulating for several months before it was identified," Frieden said.

Had it been detected, he said, vaccine makers could have started work on a vaccine month earlier.

Frieden also noted there was confusion about how many vaccines would be available, and when. HHS has been criticized for at first saying 250 million vaccines would be produced, and then rolling back on the numbers that could be delivered.

- "Clearly we need to do better at managing vaccine expectations," Frieden said.

Much work remains on improving vaccine technology, said Dr. Anthony Fauci, head of the U.S. National Institute of Allergy and Infectious Diseases. The goal is a so-called universal vaccine that would not have to be reformulated as the virus mutates every flu season.

– "We need to harness the science to be able to make an influenza vaccine that not only is good from season to season but ... that doesn't change from season to season and from pandemic to pandemic," Fauci said.

– "It is going to be several years before we get there."

CDC Identifies Racial Minorities as High Risk for H1N1 Complications

The Flu Case // Kake.com, 18 December 2009, 15:29
https://web.archive.org/web/20100102052718/http://theflucase.com/index.php?option=com_content&view=article&id=2343%3Acdc-deploys-h1n1-vaccine-as-ethnic-weapon&catid=1%3Alatest-news&Itemid=64&lang=en

The U.S. Centers for Disease Control and Prevention (CDC) has named groups of people that are at a high risk of developing serious complications from H1N1 Influenza. In keeping with the last three subpopulation releases, which focused on pregnant women, breastfeeding moms, and those who smoke, the Sedgwick County Health Department will continue to send monthly releases focused on different subgroups.

Currently, one of the highest priority groups consists of persons with chronic health conditions. For various reasons, racial minorities tend to have more cases of these health conditions, including diabetes and heart disease. Diseases such as asthma, lung disease, diabetes and other conditions affect the immune and respiratory systems. Individuals with these conditions are therefore more likely to develop severe complications from H1N1. Latinos, Hispanics and African Americans have a higher rate of these underlying conditions and are therefore at a higher risk of life-threatening flu complications.

One of the most common underlying health conditions that can lead to complications from the flu is asthma. According to the Environmental Protection Agency (EPA), African Americans visit the emergency department for asthma 350 percent more often than Caucasians, are hospitalized for asthma 240 percent more often than Caucasians and die from asthma 200 percent more often than Caucasians. Puerto Ricans also are disproportionately affected by asthma: Puerto Ricans have asthma 125 percent more often than Caucasians and 80 percent more often than African Americans. Puerto Ricans also have the highest rate of asthma attacks.

The best way to protect oneself from H1N1 is to receive the vaccine. The Sedgwick County Health Department is currently offering vaccine to anyone who wishes to receive it at the Health Department's H1N1 Vaccine Clinic (4095 E. Harry). So far, disproportionately low numbers of minorities have visited the H1N1 Vaccine Clinic. The Health Department encourages everyone, including minorities, who may have an underlying health condition to receive the vaccine. The vaccine is FREE of charge. Aside from regular clinic hours, the following mobile clinics have been set up for convenient vaccine receipt.

Irish Independent

Majority of health workers have not had swine flu jab

Irish Independent, 18 December 2009, 13:00
https://www.independent.ie/life/health-wellbeing/majority-of-health-workers-have-not-had-swine-flu-jab/26592659.html

Fewer than one in five healthcare workers have received the swine flu jab, despite the death toll now standing at 22. The Irish Independent has also learned that take-up of the vaccine in some hospitals is less than 10pc. Nurses administering the vaccine have reported that take-up among HSE medical staff has been particularly low, although a greater number of health workers in the community – such as home help and care workers – have availed of it.

The Health Service Executive (HSE) has confirmed that "less than 30,000" healthcare workers have received the vaccine. There are 111,000 HSE workers, including administration staff and management. However, the number vaccinated includes general healthcare workers, of which there are an estimated further 50,000.

This means that fewer than one in five workers have had the jab, and it's an even smaller percentage for frontline staff.

Last night, an HSE spokeswoman said it was continuing to encourage staff and the public to get vaccinated. She said that while take-up in some regions may be low, it's "over 50pc" in others. "We have found that in hospitals that have been dealing with cases of swine flu, staff are very aware of the impact the virus has on patients," she said. – "As a result, the uptake among staff is much higher. We'd like to reiterate why it's so important to get it. We're looking at as high an uptake as possible." She also appealed to those who are particularly vulnerable – including children, pregnant women, those with underlying medical conditions and those over 65 – to get the vaccine.

Immune

However, Dr Juliet Bressan, a Dublin-based doctor, said many GPs feel they are immune and are not getting the jab. – "GPs are very reluctant to take any vaccine but we don't really know why," she said. She added that her husband caught the virus a few months ago but she didn't – despite not getting the jab, and she has no intention of having it.

According to Dr Bresson, there was a similar virus outbreak in 1968 and therefore, she claimed, people born before then are probably immune. – "Most people don't have the medical knowledge to know whether they really need it or not," she said. "But GPs can make a scientific calculation."

She added that the purpose of vaccinating healthcare workers was not to protect them but to stop the virus spreading.

Figures released last night by the Department of Health reported that two more people have died from swine flu but the number contracting the disease continues to fall.

The death of a girl and a woman in the past week has brought the total number of deaths here from H1N1 to 22.

Chief medical officer Dr Tony Holohan yesterday expressed his condolences to the families of the woman, who was from the east of the country, and the girl, who was from the west.

Both had underlying health problems -- a feature in all but one of the deaths from the disease.

There are 152 people in hospital being treated, nine of whom are in intensive care.

However, the number of people contracting swine flu has dropped in the last week, said Dr Holohan.

In Northern Ireland, a nine-year-old child has died from the virus. The victim had underlying health conditions and died within the past few days.

Dr Joan Gilvarry, from the Irish Medicines Board, said more than 500,000 people have been vaccinated in the Republic -- with 790 reports of adverse reactions.

NEW BRITAIN HERALD

Mayor: City will help homeless through coldest nights

New Britain Herald, 18 December 2009
https://web.archive.org/web/20100102023147/http://theflucase.com/index.php?option=com_content&view=article&id=2326%3Ahomeless-chosen-for-bigpharma-experiments-again&catid=1%3Alatest-news&Itemid=64&lang=en

New Britain – On the coldest night of the year so far Mayor Timothy Stewart vowed Thursday to help the Friendship Center address the overflow of homeless people seeking shelter.

In previous years the center, which serves 52 clients including single men, women and families with children, has taken in cold-weather "overflow" homeless people seeking shelter only on bitterly cold nights.

But center executive director Ellen Perkins-Simpson has been trying to find a way for months to handle the overflow without stretching staff too thin or allowing the adults to mix with the children for fear of spreading the H1N1 flu.

"Previously we would allow them to sleep on couches upstairs but because of H1N1 we decided to put them in cots in the dining room so the overflow population doesn't interact with the children," Perkins-Simpson said.

The city has recently received H1N1 vaccine for distribution, Stewart said, and *he would make getting the homeless vaccinated a priority* to help alleviate the concerns for the children at the shelter.

=> the continuation has been deleted

It is worth to remember the tests conducted in Poland by Novartis AG. For a small reward homeless received injections and were told it was seasonal flu vaccine when in fact it was experimental bird flu formulation. Estimates are 32 homeless died out of 350 participants. Investigation started against the staff administering injections but the drug cartel wasn't sued. Below links to press releases covering those events of summer 2007:

Christian Cotten

Roselyne Bachelot assignée en référé le 4 janvier 2010 au TGI de Paris par Marc Vercoutère/Cri-Vie et Christian Cotten/Politique de Vie

Politique de Vie, 19 décembre 2009
https://www..net/index.htm

Communiqué du 19 décembre 2009 – Christian Cotten – Marc Vercoutère

Madame Roselyne Bachelot, Ministre de la Santé, a reçu vendredi 11 une assignation à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier prochain à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

L'Association Cri-Vie (Centre de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue, ont engagé cette procédure judiciaire suite au constat juridique et médical d'un «danger imminent» encouru par la population soumise depuis plusieurs semaines à des «vaccins» hautement toxiques pour la santé ; vaccins qui présentent de façon manifeste un rapport bénéfices/risques de plus en plus défavorable chaque jour, au regard des centaines de signalements, notamment en Europe et en Amérique du Nord, d'effets secondaires graves allant jusqu'à de multiples décès, qui semblent aujourd'hui être au moins dix fois plus nombreux qu'attendus par les promoteurs eux-mêmes de ces vaccins.

Leur volonté est totalement déterminée, de faire cesser dès janvier 2010 une campagne de vaccination contraire aux intérêts de la population et d'obtenir la désignation d'un collège d'experts indépendants chargés d'évaluer les effets réels du Tamiflu et de faire connaître à la population les moyens simples et sains de prévention et d'accompagnement de la grippe.

Tandis que la Pologne refuse des vaccins insufisamment testés, que des parlementaires russes demandent une commission d'enquête sur la corruption au sein de l'OMS, les preuves s'accumulent chaque jour de la dangerosité des vaccins et de celle du Tamilflu ainsi que des liens d'intérêt entre les industriels et les « experts », qui dramatisent une épidémie qui n'existe pas pour vendre des vaccins-poisons (corrruption manifeste du Pr hollandais Osterhaus et du Pr français Bruno Lina).

Cri-Vie et Politique de Vie, Marc Vercoutère et Christian Cotten font donc solennellement appel à l'institution judicaire, en souhaitant ardemment que celle-ci se montre à la hauteur de l'importance des enjeux et soit capable d'assumer ses responsabilités morales, politiques et judiciaires, puisque le droit lui donne le pouvoir de faire cesser immédiatement une mise en danger d'autrui évidente, manifeste et indiscutable, au regard des données scientifiques actuellement disponibles fournies par les chercheurs indépendants et intègres.

L'audience de référé aura lieu le lundi 4 janvier à 9 h du matin, au TGI de Paris, 4 bd du Palais (75001 PARIS), en salle de réunion près du cabinet du vice-président Emmanuel Binoche, avec les avocats des parties.

Le texte complet de l'assignation est accessible sur le site de Politique de Vie. Les auteurs de l'assignation sont conseillés et accompagnés dans leur démarche citoyenne de lanceurs d'alerte par Maître Malika Ouarti (Barreau de Paris) et Maître Jean-Pierre Joseph (Barreau de Grenoble). Cette procédure est menée en cohérence avec les plaintes contre X avec CPC déposées il y a peu devant les Doyens des Juges d'Instruction de Grenoble, Nantes, Évry, Pauet Paris par différents groupes de citoyens et en cours de procédure.

Le Dr Marc Vercoutère et Christian Cotten invitent journalistes et citoyens à assister en nombre à cette audience publique.

ZEIT ONLINE | GESUNDHEIT

Hartmut Wewetzer

Verstärkte Verunsicherung

Zeit, 19 Oktober 2009, 10:28 Uhr
https://web.archive.org/web/20091230234109/http://www.zeit.de/wissen/2009-10/impfung-schweinegrippe-regierung

Ist der Impfstoff für die Bevölkerung schlechter als jener für die Regierung? Die Sonderbehandlung könnte der Schweinegrippeimpfung das Vertrauen kosten.

Der Piekser wird der gleiche sein, der injizierte Schweinegrippe-Impfstoff jedoch nicht: Die Bundesregierung hat einen anderen Wirkstoff geordert

Auch das noch. Wenige Tage vor dem Start der Impfung gegen die Schweinegrippe am 26. Oktober sickerte durch, dass die Bundesregierung und die Ministerien einen anderen Impfstoff als das "Volk"bekommen. Einen ohne Verstärker. Das könnte den in die Schlagzeilen geratenen Impfstoff "Pandemrix“, der Verstärker enthält und von dem Deutschland 50 Millionen Dosen bestellt hat, endgültig das Vertrauen kosten.

Hinzu kommen die Attacken von Ärztefunktionären und Pharmakritikern, die zwar überwiegend keine Impfstoffexperten sind, aber dafür umso mehr auf die Pauke hauen. Von einer "Kampagne der Pharmakonzerne"ist die Rede, die Deutschen würden zu "Versuchskaninchen der USA "gemacht, die Sache stinke "zum Himmel“.

Wie sehen die Fakten aus? In Europa sind drei Impfstoffe gegen die Schweinegrippe zugelassen. Sie basieren auf vorgetesteten Modellimpfstoffen, die im Fall einer Pandemie rasch produziert werden können, indem man sie an den grassierenden Virusstamm anpasst. Die Impfstoffe "Pandemrix" (Hersteller GSK) und "Focetria"(Novartis) enthalten einen Verstärker, der unter anderem Squalen enthält, ein aus Haifischleber gewonnenes Zwischenprodukt des Cholesterinstoffwechsels. Der Verstärker ermöglicht es, Viruseiweiß (Antigen) einzusparen, und soll auch gegen neue Virusvarianten besser schützen.

Außerdem enthält Pandemrix den quecksilberhaltigen Konservierungsstoff Thiomersal in geringer Dosis, um die Impfbehälter gegen Verkeimung zu schützen. Der Nutzen der Konservierung überwiege das hypothetische Risiko, so die Weltgesundheitsorganisation und die Europäische Zulassungsbehörde Emea.

Der dritte Impfstoff, "Celvapan" (Baxter), den Bundeswehr und Regierung geordert haben, kommt ohne Verstärker und Konservierungsstoff aus. Er enthält komplette Viren in höherer Dosierung. In Pandemrix sind 3,75 Mikrogramm Viruseiweiß, in Celvapan 15 Mikrogramm.

Die Sicherheit von Pandemrix wurde an 5000 erwachsenen Versuchspersonen überprüft. Schwerwiegende Nebenwirkungen wurden nicht beobachtet. Außerdem wurde der Impfstoff bei etwa 400 Kindern im Alter von drei bis neun Jahren getestet und allgemein gut vertragen. Bei zwei Prozent der Kinder trat Fieber auf, Schüttelfrost bei einem Prozent (Altersgruppe drei bis fünf) und bei vier Prozent (sechs bis neun Jahre).

Der verstärkerfreie, in Säugetierzellen hergestellte Impfstoff Celvapan ist insgesamt weniger gut getestet. Es gibt Informationen über Tests an rund 600 Versuchspersonen, bei denen überwiegend leichte Nebenwirkungen auftraten. Nach heutigem Wissensstand gelten jedoch beide Impfstoffe als wirksam und sicher.

Die Tests können wegen der begrenzten Zahl an Versuchspersonen und der noch begrenzten Erfahrung mit den neuen Impfstoffen seltene Nebenwirkungen nicht ausschließen. Deshalb muss die Schweinegrippe-Impfung genau überwacht werden.

Zunächst sollen Beschäftigte im Gesundheitswesen, chronisch Kranke und Schwangere geimpft werden, empfiehlt die Ständige Impfkommission (Stiko). Schwangere sollen vorsorglich einen Impfstoff ohne Verstärkung bekommen, schlägt die Stiko vor. Diesen will die Bundesregierung nun rasch besorgen.

Allerdings ist Pandemrix in Europa durchaus für Schwangere zugelassen. In anderen Ländern, etwa Großbritannien, hat man kein Problem damit, diese mit Pandemrix zu impfen. Es gebe keine Hinweise, dass die Schweinegrippe-Impfung Schwangeren oder ihrem ungeborenen Baby schade, teilt der britische Gesundheitsdienst mit. Eine so erregte Debatte wie in Deutschland gibt es in Großbritannien nicht. Während bei uns vor einem "Großversuch"an der Bevölkerung gewarnt wird, übt man sich jenseits des Kanals in Gelassenheit. Mal sehen, wer recht behält.

Schweingrippe-Impfung: Rösler appelliert an die Ärzte

Dtsch Arztebl 21 Dezember 2009; 106 (51-52): A-2532 / B-2184 / C-2116
https://www.aerzteblatt.de/archiv/67182/Schweingrippe-Impfung-Roesler-appelliert-an-die-Aerzte

Bundesgesundheitsminister Philipp Rösler (FDP) hat die Ärzteschaft bei der Impfkampagne gegen die Neue Grippe um ihre Unterstützung gebeten. "Helfen Sie mit, damit Menschen wieder Vertrauen in den Schutz durch Impfen zurückgewinnen", appelliert Rösler in einem Schreiben an alle Ärztinnen und Ärzte (siehe offener Brief in diesem Heft). Der Minister dankt in dem Papier denen, die in den vergangenen Wochen die Impfaktion unterstützt haben. Der Ausbreitung des A/H1N1-Virus müsse vorgebeugt werden. Dafür sei die Impfung der beste Schutz.

Nach jüngsten Erhebungen haben sich bisher nur circa fünf Prozent der Bundesbürger und 15 Prozent der Ärzte impfen lassen. Da die Krankenkassen nur die Kosten für die tatsächlich verbrauchten Impfdosen übernehmen, könnten die Länder auf Millionenkosten sitzen bleiben. Das Bundesgesundheitsministerium (BMG) unterstützt den Vorstoß einiger Länder, nicht benötigten Impfstoff im Ausland zu veräußern. Das BMG habe über die Botschaften Angebote verbreitet, sagte eine Sprecherin. Ob Impfstoff verkauft oder verschenkt werde, müssten die Bundesländer entscheiden. Das Land Bremen will sich für eine Stornierung bereits bestellter Impfstoffe einsetzen. Mit anderen Ländern habe man vereinbart, noch vor Weihnachten mit dem Hersteller in Verhandlungen zu treten, sagte eine Sprecherin der Bremer Gesundheitsbehörde.

Unterdessen steht nun auch der Impfstoff ohne Adjuvanzien für Schwangere zur Verfügung. BH/ddp

NOVARTIS

All three Novartis A(H1N1) 2009 influenza vaccines prequalified by World Health Organization (WHO) for use in developing world

Novartis, 21 December 2009, 07:15 CET
https://web.archive.org/web/20100109234032/http://www.novartis.com/newsroom/media-releases/en/2009/1365351.shtml

- First prequalification from WHO *for multiple influenza A(H1N1) 2009 vaccines from a single company*: Celtura® and Focetria®, both with the Novartis adjuvant MF59®, as well as unadjuvanted A(H1N1) vaccine from the Fluvirin® platform;
- WHO prequalification of two MF59 adjuvanted vaccines highlights Novartis adjuvants antigen sparing potential as means to enhance global supply of pandemic vaccines;
- More than 80 million doses of Novartis influenza A(H1N1) vaccine shipped to 21 countries around the world.

Basel, December 21, 2009: Novartis announced today that the World Health Organization (WHO) has granted prequalification for all three of its influenza A(H1N1) 2009 monovalent vaccines for supply to United Nations (UN) agencies: the cell culture-based and MF59® adjuvanted vaccine Celtura®, the egg-based and MF59 adjuvanted vaccine Focetria® as well as the egg-based A(H1N1) vaccine manufactured using the seasonal Fluvirin® platform. In addition to granting prequalified status for Novartis' three influenza A(H1N1) 2009 vaccines, WHO has also granted prequalification for the company's trivalent seasonal Fluvirin® vaccine.

WHO prequalification facilitates purchasing through UN agencies and thus enhances access for developing world countries to Novartis A(H1N1) 2009 vaccines that meet unified standards of quality and safety. Novartis has worked closely with WHO under WHO's expedited procedure for evaluating pandemic influenza A(H1N1) 2009 vaccines to ensure rapid prequalification of its A(H1N1) 2009 influenza vaccines.

With WHO prequalification for all three of our A(H1N1) 2009 vaccines, we have expanded our commitment to contribute to the prevention of A(H1N1) 2009 influenza in all countries around the world, said Andrin Oswald, CEO of Novartis Vaccines and Diagnostics.

Prequalification of the adjuvanted vaccines is an important milestone to increase vaccine supply due to the proven antigen and dose sparing potential of the MF59 adjuvant. It is the only oil-in-water adjuvant supported by more than 12 years of post-marketing safety data that includes commercial distribution of more than 45 million doses. The adjuvant has also been studied in randomized clinical trials and observational studies involving 124,000 individuals including children, adults, and elderly; and was first licensed in the seasonal influenza vaccine Fluad® in Italy in 1997. Fluad is currently licensed in Europe for use in individuals 65 years of age and older.

Novartis recognizes the public health need for better access to medicines and vaccines in developing countries. Novartis is working closely with developing countries and international health agencies to find sustainable solutions for effective distribution of essential medicines for diseases such as malaria, meningitis, tuberculosis and leprosy.

About Celtura®

Celtura is an innovative adjuvanted, cell culture-based, inactivated subunit influenza vaccine indicated for active immunization of persons six months of age and older against influenza disease caused by the novel pandemic A(H1N1) 2009 influenza virus. Celtura was approved for use in both Germany and Switzerland in November 2009, and Novartis is also seeking approval in a number of other countries.

About Focetria®

Focetria is an adjuvanted, egg-based, inactivated subunit influenza vaccine indicated for active immunization of persons six months of age and older against influenza disease caused by the novel pandemic A(H1N1) 2009 influenza virus. Focetria was approved by the European Union on September 29, 2009, for use in all 27 member states of the European Union, plus, by extension, in Iceland, Norway and Liechtenstein through the European Economic Area (EEA) Agreement. It is also licensed in a variety of other countries including Turkey, Switzerland, Tunisia and Croatia.

About Novartis A(H1N1) vaccine from the Fluvirin® platform

This vaccine is an unadjuvanted, egg-based, inactivated subunit influenza vaccine indicated for active immunization of persons four years of age and older against influenza disease caused by the novel pandemic A(H1N1) 2009 influenza virus. The vaccine was approved for use in the US by the US Food and Drug Administration on September 15, 2009.

Disclaimer

The foregoing release contains forward-looking statements that can be identified by terminology such as "potential," "commitment," "seeking approval," or similar expressions, or by express or implied discussions regarding potential additional marketing approvals for Novartis' A(H1N1) vaccines, potential future deliveries of influenza vaccines, or regarding potential future revenues from influenza vaccines.

You should not place undue reliance on these statements. Such forward-looking statements reflect the current views of management regarding future events, and involve known and unknown risks, uncertainties and other factors that may cause actual results to be materially different from any future results, performance or achievements expressed or implied by such statements.

There can be no guarantee that Novartis' A(H1N1) vaccines will be approved for sale in any additional countries. Nor can there be any guarantee that Novartis will successfully meet its delivery obligations for its influenza vaccines. Neither can there be any guarantee that Novartis' influenza vaccines will achieve any particular levels of revenue in the future.

In particular, management's expectations regarding Novartis' A(H1N1) vaccines could be affected by, among other things, unexpected regulatory actions or delays or government regulation generally; unexpected manufacturing difficulties or delays, including continued unexpected difficulties with seed virus yields, and unexpected difficulties with our flu cell culture manufacturing facility and processes; unexpected clinical trial results, including unexpected new clinical data and unexpected additional analysis of existing clinical data; the company's ability to obtain or maintain patent or other proprietary intellectual property protection; competition in general; government, industry and general public pricing pressures; the impact that the foregoing factors could have on the values attributed to the Novartis Group's assets and liabilities as recorded in the Group's consolidated balance sheet, and other risks and factors referred to in Novartis AG's current Form 20-F on file with the US Securities and Exchange Commission.

Should one or more of these risks or uncertainties materialize, or should underlying assumptions prove incorrect, actual results may vary materially from those anticipated, believed, estimated or expected. Novartis is providing the information in this press release as of this date and does not undertake any obligation to update any forward-looking statements contained in this press release as a result of new information, future events or otherwise.

Le Parisien

Nicolas Sarkozy vacciné contre la Grippe A

Le Parisien, 22 décembre 2009, 20h32
https://www.leparisien.fr/politique/nicolas-sarkozy-vaccine-contre-la-grippe-a-22-12-2009-753859.php

Nicolas Sarkozy a déclaré avoir été vacciné contre la grippe A. En visite mardi au centre hospitalier de Créteil avec sa femme Carla Bruni-Sarkozy, il a affirmé qu'«un peu plus de 4 millions et demi de personnes», dont lui-même, se sont fait vacciner à ce jour contre la grippe pandémique H1N1 en France. « Il faut continuer, avec le froid qui revient, à faire cet effort de vaccination de masse face à cette grippe», a assuré le chef de l'Etat.

A la question de savoir s'il était lui-même vacciné, M. Sarkozy a répondu: «Mais bien sûr, je ne peux pas dire aux gens « vaccinez-vous » et ne pas le faire moi-même».

«Le nombre de personnes vaccinées depuis le début de la campagne de vaccination était au total de 4.347.425 dimanche 20 décembre, soit un million de plus que dimanche dernier», avait indiqué lundi Gérard Gachet, porte-parole du ministère de l'Intérieur.La grippe H1N1 a entraîné quatre nouveaux décès en France métropolitaine depuis vendredi, soit un total de 168 depuis le début de l'épidémie, selon l'Institut de veille sanitaire (InVS).

THE FLU CASE

H1N1 Vaccine Ingredients, Packages' Inserts and Warnings

The Flu Case, 22 December 2009
https://web.archive.org/web/20100102012703/http://theflucase.com/index.php?option=com_content&view=article&id=2386%3Ah1n1-vaccine-ingredients-packages-inserts-and-warnings&catid=1%3Alatest-news&Itemid=64&lang=en

Not one scientific study has ever established the long-term safety of adjuvants and none have ever been approved for use in vaccines for humans.

Science dictates that only a randomized double-blind, placebo-controlled study can generate unbiased results in any clinical trial. In the history of vaccine development, no such study has ever been performed. It is only unscientific opinions and pharmaceutical propaganda which have propelled the mythological validity, safety and effectiveness of vaccines. Dozens of controlled studies have scientifically verified the immunotoxicty, neurotoxicity and sterility of common vaccine ingredients which destroy human health, yet they are all ignored by conventional medicine.

There should be a public outcry and challenge to every public health official, medical specialist or scientist (from any country) who justifies the inoculation of their population without providing the evidence of safety and effectiveness of the respective H1N1 vaccine in their country.

The public should be demanding that their governments materialize at least one vaccine trial which is randomized, double-blind and placebo-controlled that can scientifically validate the assertions of public health officials.

Since the pharmacokinetic properties of vaccines are not studied, vaccine manufacturers cannot deny any of the toxic effects listed below. The reason they never analyze the absorption, distribution, metabolism or excretion of these ingredients is because it would eradicate the vaccine industry. However the individual effects of each ingredient and their toxic effects on cells are well documented.

Every Physician, Nurse or medical personnel who administers the H1N1 vaccine (or any vaccine) should be asking themselves why they are injecting the following ingredients into patients that have been scientifically proven to cause immunotoxicity, neurotoxicity, sterility and cancer.

The following are the ingredient lists, warnings and side effects for vaccines currently scheduled to be administered to populations worldwide for the H1N1 swine flu.

H1N1 Vaccine Packages' Inserts: Ingredients and Warnings

Prevet Disease, 21 September 2009

Not one scientific study has ever established the long-term safety of adjuvants and none have ever been approved for use in vaccines for humans.

THE FLU CASE

The CDC's List of
Chemicals commonly used in the production of Vaccines

https://web.archive.org/web/20100102023557/http://theflucase.com/index.php?option=com_content&view=article&id=2387%3Athe-cdcs-list-of-chemicals-commonly-used-in-the-production-of-vaccines&catid=1%3Alatest-news&Itemid=64&lang=en

Chemicals commonly used in the production of vaccines include a suspending fluid (sterile water, saline, or fluids containing protein); preservatives and stabilizers (for example, albumin, phenols, and glycine); and adjuvants or enhancers that help improve the vaccine's effectiveness. Vaccines also may contain very small amounts of the culture material used to grow the virus or bacteria used in the vaccine, such as chicken egg protein.

Additives used in the production of vaccines may include suspending fluid (e.g. sterile water, saline, or fluids containing protein); preservatives and stabilizers to help the vaccine remain unchanged (e.g. albumin, phenols, and glycine); and adjuvants or enhancers that help the vaccine improve its work.

Aluminum gels or salts of aluminum which are added as adjuvants to help the vaccine stimulate a better response to the vaccine. Adjuvants help promote an earlier, more potent response, and more persistent immune response to the vaccine.

Formaldehyde is used to inactivate bacterial products for toxoid vaccines, (these are vaccines that use an inactive bacterial toxin to produce immunity.) It is also used to kill unwanted viruses and bacteria that might contaminate the vaccine during production.

Monosodium glutamate (MSG) and 2-phenoxy-ethanol which are used as stabilizers in a few vaccines to help the vaccine remain unchanged when the vaccine is exposed to heat, light, acidity, or humidity.

Thimerosal is a mercury-containing preservative that is added to vials of vaccine that contain more than one dose to prevent contamination and growth of potentially harmful bacteria.

To find out what chemical additives are in specific vaccines, ask your healthcare provider or pharmacist for a copy of the vaccine package insert, which lists all ingredients in the vaccine and discusses any known adverse reactions.

https://web.archive.org/web/20070921174430/http:/www.cdc.gov/vaccines/vac-gen/additives.htm

Aluminum salts and gels, used as vaccine adjuvants, have been associated with motor paralysis, fatty degeneration of the kidneys and liver, learning disabilities, dementia, bone dissolution, et cetera. https://web.archive.org/web/20121206082825/http://vran.org/about/policy-statement-on-vaccination/

Dr Butler-Jones says Canada may opt for a ‘pandemic’ vaccine which contains adjuvant. This, he says would increase its immunizing power such that more doses could be obtained and still leave enough vaccine available for the rest of the world. The downside he doesn’t mention is that, for the very reason that adjuvants boost the immune response, they also increase the chance for injury. The conventional influenza vaccines currently licensed for use in Canada do not contain adjuvant, although they do contain mercury. Mercury is not only highly toxic by itself, it also greatly increases the toxic effects of the commonly used adjuvant aluminum.

https://web.archive.org/web/20111113060258/http://vran.org/in-the-news/pandemic-vaccine-risk/

The vaccine’s manufacturer, Bioport of Lansing, Michigan, has never passed an FDA inspection. Numerous problems include lack of sterility, contamination problems, quality control problems, lack of consistency in manufacturing, falsification of the expiration dates on some lots of the vaccine (labels were switched), and the presence of squalene, an adjuvant which is illegal in the United States.

THE FLU CASE

Staff of Meeting of Globalists in Switzerland Ordered to take Swine Flu Jab

The Flu Case, 22 December 2009 10:32
https://web.archive.org/web/20100220011735/http://www.theflucase.com/index.php?option=com_content&view=article&id=2383%3Astaff-of-meeting-of-globalists-in-switzerland-ordered-to-take-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

When the "global elite" meet in January to discuss just how badly their climate gate and swine flu scams are going at the World Ecomic Forum (WEF) in Davos, Switzerland – ex CDC director Julie Gerberding also attended – they will not be required to have the swine flu shot.

However, WEF boss, Klaus Schwab has ordered all employees to get the jab, including hotel workers, according to a report in "Sonntagsblick."

Thomas Geiser, who appears to be a government employed legal advisor, maintains the requirement for even hotel staff to take the untested and toxic shot for a mild pandemic is lawful, according to the newspaper.

THE FLU CASE

Mitarbeiter beim WEF müssen sich impfen lassen

The Flu Case, 22 December 2009 10:32
https://web.archive.org/web/20100220011735/http://www.theflucase.com/index.php?option=com_content&view=article&id=2383%3Astaff-of-meeting-of-globalists-in-switzerland-ordered-to-take-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Für das World Economic Forum WEF im Januar in Davos müssen sich sämtliche Mitarbeiter impfen lassen.

Davos. – Vorgeschrieben wird am diesjährigen World Economic Forum (WEF) in Davos sowohl eine Impfung gegen die Schweinegrippe wie auch gegen die saisonale Grippe. Das berichtete der «Sonntagsblick».

Sollten die Angestellten nicht beide Impfungen haben, könne man sie beim WEF nicht arbeiten lassen, heisst es in einem Schreiben an externe Mitarbeiter. Wie der St. Galler Arbeitsrechtler Thomas Geiser gegenüber der Zeitung sagte, sei dieses Verhalten rechtlich zulässig. Insofern noch keine Arbeitsverträge abgeschlossen seien, könne das WEF die Anstellung verweigern, für den Fall, dass sich der Arbeitnehmer nicht zur Impfung verpflichtet, so der Experte weiter.

US President Obama and First Lady get vaccinated against H1N1 flu

CCTV, 22 December 2009, 11:15 BJT
http://english.cctv.com/20091222/102191.shtml

In an interview today with American Urban Radio Networks in the Oval Office, the President made clear that the time for adults to get their H1N1 shots is now and that it is safe. "People need to understand that this vaccine is safe," Obama said. "Michelle and I just got the shots ourselves... we wanted to make sure nationwide that children were getting it before adults did. And now there's enough vaccine so that adults should get it as well."

In an interview today, the US President made clear that the time for adults to get their H1N1 shots is now and that it is safe.

NBC NEWS

JoNel Aleccia

60 million in U.S. vaccinated against swine flu

NBC News, 23 December 2009, 3:03 AM +08
https://www.nbcnews.com/id/wbna34525214

About 60 million Americans have received the swine flu vaccine, including a large proportion of children, a government health official said Tuesday.

That estimate comes as supplies of the H1N1 vaccine have vastly increased, with about 111 million doses available now in places as varied as doctors offices, shopping malls and retail pharmacies.

"That's a lot of vaccine and that's really good news," said Dr. Anne Schuchat, director of the National Center for Immunization and Respiratory Diseases at the Centers for Disease Control and Prevention.

About half of Americans have said they want to be vaccinated against the pandemic virus, Schuchat added.

The CDC based the vaccine uptake estimate on two recent surveys. In the first, a CDC study of nearly 1,400 adults and more than 3,000 children, about 46 million people had received the vaccine as of the week of Dec. 6-12. About 46 percent of those were children, Schuchat said.

A second study by Harvard University researchers surveyed 1,600 people Dec. 16 and 17 and estimated that about 56 million people had been vaccinated against swine flu. In that study, three-quarters of parents who tried to get vaccine for their children were able to do so.

Schuchat reminded parents that children younger than 10 need two doses of the vaccine, according to federal studies. About 2 million children had received second doses at the time of the CD study.

"Many Americans who want to be vaccinated have a great chance to in the days ahead," Schuchat said.

However, many Americans also have indicated that they don't intend to get the H1N1 vaccine for themselves or their children. The Harvard study found that 55 percent of adults did not want the vaccine for themselves and about 35 percent of parents wouldn't immunize their children.

Most who rejected the vaccine cited safety reasons as a major factor, the Harvard study said.

With millions more vaccinated against the virus, the safety profile of the vaccine seems strong, Schuchat said.

"We are not seeing any worrisome signs," she said.

U.S. A/H1N1 flu vaccine supply reaches 111 million doses

CCTV, 23 December 2009, 11:06 BJT
http://english.cctv.com/20091223/102343.shtml

Houston, Dec. 22 (Xinhua) – The supply of A/H1N1 flu vaccine has reached more than 100 million doses in the U.S., a high-ranking health official announced on Tuesday.

"As of today, about 111 million doses of H1N1 vaccine have become available for order by the states," Dr. Anne Schuchat, director of U.S. Centers for Disease Control and Prevention's (CDC) National Center for Immunization and Respiratory Diseases, said during an afternoon press conference.

"The H1N1 vaccine supply is getting better and better," she added.

During the past two months, limited supply of vaccine caused the CDC to advise state and local health officials to reserve doses for the targeted group, which includes pregnant women, children and young adults, health-care workers and people with asthma and certain other health problems.

"Initial doses of vaccine were relatively quickly taken up and they were going to the people that they were targeted for," Dr. Schuchat confirmed.

"Vaccine is becoming available in more and more places and at more and more times," she said. "It's a really good time (for general public) to be vaccinated in the weeks ahead."

The U.S. Government ordered 251 million doses of A/H1N1 flu vaccine, and most states now offer the vaccine to people of all ages. While the shots and nasal sprays are paid for by the U.S. government, clinics can charge a fee around 20 dollars to administer them.

With 111 million doses now available, experts believe that it should be widely available in doctors' offices, public health departments, drug stores, and even shopping malls during the upcoming traditional holiday seasons.

U.S. FOOD & DRUG ADMINISTRATION

FDA Approves a High dose Seasonal Influenza vaccine specifically intended for People ages 65 and Older

FDA Press Release, 23 December 2009

https://web.archive.org/web/20091231075127/http://www.fda.gov/NewsEvents/Newsroom/PressAnnouncements/ucm195483.htm

Accelerated approval process used in vaccine approval

The U.S. Food and Drug Administration today approved Fluzone High-Dose, an inactivated influenza virus vaccine for people ages 65 years and older to prevent disease caused by influenza virus subtypes A and B.

People in this age group are at highest risk for seasonal influenza complications, which may result in hospitalization and death. Annual vaccination remains the best protection from influenza, particularly for people 65 and older.

Fluzone High-Dose was approved via the accelerated approval pathway. FDA's accelerated approval pathway helps safe and effective medical products for serious or life-threatening diseases become available sooner. In clinical studies, Fluzone High-Dose demonstrated an enhanced immune response compared with Fluzone in individuals 65 and older.

As part of the accelerated approval process, the manufacturer is required to conduct further studies to verify that the Fluzone High-Dose will decrease seasonal influenza disease after vaccination.

"As people grow older, their immune systems typically become weaker," said Karen Midthun, M.D., acting director of the FDA's Center for Biologics Evaluation and Research. "This is the first influenza vaccine that uses a higher dose to induce a stronger immune response that is intended to better protect the elderly against seasonal influenza."

Fluzone High-Dose, manufactured by Sanofi Pasteur Inc., is formulated so that each 0.5 mL dose contains a total of 180 micrograms (mcg) of influenza virus hemagglutinin (HA) which is made up of 60 mcg of each of the three influenza virus strains.

Other currently licensed seasonal influenza vaccines for adults are formulated to contain a total of 45 mcg of influenza virus hemagglutinin (15 mcg HA from each of the three influenza strains per dose). Sanofi Pasteur, also manufactures Fluzone, a seasonal vaccine for the United States approved for use in individuals ages 6 months and older.

As expected, because of the higher HA content, non-serious adverse events were more frequent after vaccination with Fluzone High-Dose compared with Fluzone. Common adverse events experienced during clinical studies included pain, redness and swelling at the injection site and headache, muscle aches, fever and malaise. The rate of serious adverse events was comparable between Fluzone High-Dose and Fluzone.

People with hypersensitivity to egg proteins or life-threatening reactions after previous administration of any influenza vaccine should not be vaccinated with Fluzone High-Dose.

Fluzone High-Dose is administered as a single injection in the upper arm and is available in single dose pre-filled syringes without preservative.

The Gleaner Jamaica WI Established 1834

Dahlia McDaniel

All I want for Christmas is my flu vaccine

The Gleaner, 23 December 2009
https://web.archive.org/web/20091227192910/http://www.jamaica-gleaner.com/gleaner/20091223/health/health4.html

Last Christmas, my article expressed the same sentiments about getting the seasonal flu vaccine since the flu (short for influenza) is an unwelcome visitor this time each year. Ironically, last year Christmas, the swine flu and its vaccine were nowhere on our radar.

Fast-forward to Christmas 2009, and just as we are waiting to see Christmas and the New Year arrive, we are expecting the arrival of the H1N1 (swine flu) vaccine to Jamaica. Reports show, however, that there is a shortage of the vaccine worldwide.

Will the vaccine come to Jamaica?

Although it has been three months since the approval of the new H1N1 (2009) vaccine, here in Jamaica we do not yet have a scheduled date for its arrival. Hundreds of millions of doses have been manufactured by at least three manufacturers but it is still not enough to go around. We know, however, that the Government of Jamaica via the Ministry of Health (our national health authority) will regulate its distribution here.

What's in the vaccine?

When a person is given the vaccine, the immune system (the body's natural defence system) will produce its own protection (antibodies) against the disease. None of the ingredients in the vaccine can cause flu. The vaccine consists of:

An antigen (in this case it is an inactive preparation of the flu virus). This pushes the body's defence mechanism to respond to the virus. The virus is inactivated so it won't give us the flu. The body will then produce antibodies, a protein substance to fight the antigen from the vaccine and any H1N1 (2009) virus which enters the body within a certain time frame thereafter.

An adjuvant, a chemical like aluminium hydroxide which increases the effectiveness of the vaccine. This may mean that less antigen is needed to produce the same vaccine. By extension, more doses of vaccine may be produced. The adjuvant may or may not be present in a vaccine. The only challenge is that vaccines with adjuvants tend to carry more side effects than those without. There are no flu vaccines with adjuvants licensed in the USA.

Who should be vaccinated?

Persons who are at risk of serious complications, like pneumonia, heart damage and dehydration, from the effects of the swine flu are regarded as being 'at risk'.

These people include children under five years old, the elderly, pregnant women, persons with diabetes, kidney and heart disease and those with a weak immune system, for example, those with HIV, cancer, and those undergoing chemotherapy or radiotherapy. Other at-risk persons are those with respiratory trouble, like asthma, bronchitis and emphysema.

Go ahead, have a happy Christmas

Don't allow any flu ('swine' or 'seasonal') to dampen your Christmas spirits. If you are at risk, as soon as the swine flu vaccine makes its appearance here, try to get yourself vaccinated. If you can, give yourself the gift of a flu vaccine. As for me, that's all I want for Christmas!

AFTONBLADET

Mikael Stengård

Vaccinleveranser till Sverige stoppas

Aftonbladet, 23 December 2009
http://www.aftonbladet.se/nyheter/svininfluensan/article6334971.ab

Leveranserna av vaccinet mot svininfluensa till Sverige stoppas i början av januari.

Det är innebörden i en ny överenskommelse mellan Socialstyrelsen, Sveriges Kommuner och Landsting samt vaccintillverkaren Glaxo Smith Kline, uppger Sveriges Radio Ekot.

Sverige var ett av få länder som från början gjorde ett heltäckande avtal med Glaxo Smith Kline och beställde 18 miljoner vaccindoser.

Och när rekommendationerna senare ändrades från två till en vaccindos per vuxen stod det klart att Sverige skulle få ett stort överskott av vaccinet.

Men nu har svenska myndigheter lyckats få ett tillfälligt stopp på fortsatta leveranser. I januari, när Sverige fått 10 miljoner doser, leveras inget mer vaccin.

– Förutsättningarna har ju ändrats lite grann så till vida att det för den här vågen för de flesta räcker med en dos. Det gör ju att vaccinåtgången varit mindre än vi förutsåg från början, säger Göran Stiernstedt vid SKL, till Ekot.

Alla ska vaccineras

Det tillfälliga leveransstoppet pågår till mitten av februari. Därefter ska man besluta vad som ska ske med de åtta miljonerna doser som är beställda.

– Direkt efter helgerna går vi in och kollar upp hur många som är vaccinerade och får ett så exakt tal som möjligt på hur stort svinnet har varit. Då är det sen lättare att ta bra beslut på hur vi ska förfara med de doser som vi inte behöver just nu, säger Göran Stiernstedt.

Stiernstedt poängterar att de avbrutna leveranserna inte innebär något stopp i vaccinationskampanjen. De som ännu inte har vaccinerat sig ska kunna göra det utan problem.

Enligt Socialstyrelsen har drygt 60 procent av befolkningen redan vaccinerat sig, och ytterligare cirka en femtedel vill göra det.

THE FLU CASE

Sweden stops the vaccine Deliveries

The Flu Case, 23 December 2009, 08:44
https://web.archive.org/web/20100102040115/http://theflucase.com/index.php?option=com_content&view=article&id=2395%3Asweden-stops-the-vaccine&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Today, Aftonbladet, the largest Swedish news paper, reported as follows:

We ordered 19 million doses - but only need half. Now the authorities have managed to stop the deliveries temporarily. Vaccine deliveries to Sweden are stopped.The delivery of the vaccine against swine flu are to be stopped from early January. That is the outcome of an agreement between several Swedish authorities and the vaccine manufacturer Glaxo Smith Kline, says Sveriges Radio Ekot.

Sweden was one of the few countries that made a deal with Glaxo Smith Kline for complete coverage and ordered 18 million doses of vaccine. When the recommendations were changed later from two to one dose per adult, it was clear that Sweden would have a large surplus of the vaccine.

But now, Swedish authorities have managed to stop further deliveries temporarily. In January,by which time 10 million doses will have been delivered, no further deliveries will be made.

Furthermore, the article states that the vaccination campaign will **not** stop and everyone that would like to get the vaccine should be able to. It also states that 60% of the Swedish people have received the shot and that another 20% would like to. These numbers need to be confirmed by going through all data after the holidays to know exactly how many in Sweden actually received the poisonous Pandemrix "swine flu" vaccine.

The wording of the article is interesting since the politicians are presented as if they are proud they managed to stop the deliveries. This gives the impression that the pharmaceutical companies are much more powerful than individual governments and countries. If this is true, it certainly explains a few things about the massive pandemic scare and vaccination campaign.

The temporary stop will be reevaluated in February.

Since Swedish citizens have a tendency to trust their government and authorities, especially "science", very many actually believed they would be better off having the vaccination and therefore large numbers in Sweden got the shot. This will result in very large amount of damages, something the Swedish authorities and media openly reported for about one week until it became clear the coverage of the damage was stopping the massive vaccination campaign.

After that, very few reports have appeared about damages from the vaccine. Judging from the initial data, more than 150 people can be assumed to have died from the poisonous Pandemrix "swine flu" shot and several hundred abortions can be assumed to have been triggered by the same vaccine. It is uncertain if the damages will ever be properly investigated and even if they were, if they ever will be made public.

Other severe cases of damages, judged from the initial reports, should be in the number of thousands. The standard tactic to deal with these are either to declare them as "expected and normal" and in that way ignore them or to claim they had nothing to do with the vaccination.

That Sweden have "managed" to get out of the contract with GSK should inspire other countries to do the same with their respective vaccine suppliers.

Sweden have been hit by the largest medical scandal in modern times and for many years this massive mass vaccination will result in hundreds of thousands of severely damaged and sick individuals, suffering from a wide variety of symptoms as seen in the Gulf War Syndrome cases.

WHO donerer mio. af doser overskudsmedicin til u-lande

Information, 23 December 2009
https://www.information.dk/indland/2009/12/who-donerer-mio-doser-overskudsmedicin-u-lande?lst_cntrb

Kæmpe overskudslagre af H1N1-vaccine doneres nu til WHO, der deler millioner af doser ud i fattige lande. WHO skaffer sig af med et politisk problem, siger kritikere.

180 millioner doser af vestens overskydende H1N1-vacciner gives lige nu til WHO, der deler dem ud i 95 lande, som er 'sårbare over for pandemien'. Afghanistan, Aserbajdsjan og Mongoliet er blandt de 35 lande, der har bedt om de gratis vacciner og skrevet under på, at de udvikler en national pandemiplan.

De gratis vacciner møder dog kritik fra flere eksperter. Når WHO skaffer sig af med de kæmpe lagre af vacciner, gør de sig samtidig fri af en politisk dårlig sag, lyder det bl.a. fra Tom Jefferson, epidemiolog ved det uafhængige forskningsinstitut, Cochrane Centre.

»Hvorfor giver de overhovedet vaccinerne til udviklingslandene? Pandemien er afblæst i store dele af verden. Den største trussel i de fattige lande lige nu er hjerte-kar-sygdomme, mens virus kommer meget langt nede på listen. Hvad er den lægelige begrundelse for at donere 180 millioner doser væk?«

Influenza en lille trussel

Medlemslande ligger inde med millioner af doser H1N1-vaccine på grund af kontrakter med vaccineproducenterne, der blev indgået før pandemien brød ud, og dermed før man kendte til pandemiens omfang. Frankrig købte 94 millioner doser og har til dato kun brugt tre millioner doser, mens Storbritannien købte 60 millioner doser. Af dem har de brugt godt fem millioner. Norge og Tyskland har besluttet at donere vaccinerne til lande, der ikke selv har mulighed for at købe vaccinerne.

Professor i virussygdomme på Rigshospitalet, Jens Lundgren, siger:
»Umiddelbart vil jeg mene, at u-landene har betydeligt større ting at slås med end den her influenza. Hvis man gerne vil gøre noget for u-landene, så skal man nok gøre noget andet,« siger Jens Lundgren.

Speciallæge i almen medicin Claus Hancke undrer sig også:

»For mig at se har u-landene ikke en pind at bruge H1N1-vaccine til. Influenza er ikke et særligt stort problem i de lande, hvor der er meget sol. Dertil kommer, at svineinfluenzaen har vist sig ikke at være særlig farlig,« siger Claus Hancke og tilføjer:

»Det virker som om, at vi gerne vil løse et affaldsproblem, og gør det ved at sende den overskydende vaccine til u-landene. I den logik er det åbenbart bedre at sprøjte affaldet ind i mennesker end at destruere det. Det er grotesk,« siger Claus Hancke, som tidligere har frarådet folk at lade sig vaccinere, fordi H1N1-vaccinen er dårligt testet og muligvis kan have ukendte bivirkninger.

Hvem holder øje?

WHO har gennemført ni workshops i alle regioner, der skal hjælpe landene med at udfærdige nationale pandemiplaner og forberede vaccinernes ankomst. Pandemiplanerne indeholder instruktioner i, hvem vaccinen gives til, hvordan den skal administreres og anbefalinger om først at vaccinere sundhedspersonale.

Alligevel er administrationen af vaccinen den største udfordring, mener Tom Jefferson fra Cochrane Centeret:

»Det er enormt vigtigt, at man er i stand til at overvåge ny medicin, når man dumper millioner af doser ned i et samfund. Man skal overvåge både effekt og bivirkninger, og hvordan har man tænkt sig at gøre det i Afghanistan?« siger han og uddyber:

»Den bedste forklaring, jeg kan komme på, er, at WHO forsøger at formindske de enorme H1N1-lagre. Den største taber i den her pandemihistorie er troværdigheden hos de offentlige sundhedssystemer og WHO. Vi kommer til at betale en enorm pris for det, når vi engang står med en rigtig folkesundhedskrise, og ingen længere stoler på sundhedssystemet. Troværdigheden er det sande offer«.

WHO donates millions of doses of surplus medical supplies to developing countries,
Denmark's Information Reports

Information, 23 December 2009 // The Flu Case, 28 December 2009
https://web.archive.org/web/20100102033722/http://theflucase.com/index.php?option=com_content&view=article&id=2419%3Awhos-swine-flu-jab-donations-to-developing-countries-demarks-information-reports&catid=41%3Ahighlighted-news&Itemid=105&lang=en
https://www.information.dk/indland/2009/12/who-donerer-mio-doser-overskudsmedicin-u-lande?lst_cntrb

An enormous surplus of H1N1 vaccines is being donated to WHO. The world health organisation distributes millions of doses to poor countries.
WHO gets rid of a political problem, say critics.

180 millions of doses of surplus H1N1 vaccines are in the process of being donated to WHO, which will distribute them to 95 countries that are "vulnerable to the pandemic."

Afghanistan, Aserbajdsjan and Mongolia are among the 35 countries which have asked for free vaccines and signed an agreement to develop national plans for a pandemic.

However, several experts have criticised the free vaccines.

By getting rid of the enormous stocks of vaccines, WHO at the same time frees itself of political problem, says, among others, Tom Jefferson, an epidemiologist at the Cochrane independent research center.

" Why do they give the vaccines to the developing countries at all? The pandemic has been called off in most parts of the world. The greatest threat in poor countries right now is heart and circulatory diseases while the virus figures at the bottom of the list. What is the medical reason for donating 180 million doses?”

Flu is a Small Threat

The member countries have millions of doses of H1N1 in stock because of the contracts with the vaccine producers, which were signed before the pandemic broke out, and so before the scope of the pandemic was known.

France bought 94 million doses but has so far used only used three millions, while Great Britain bought 60 million doses. Of these, a little over five millions have been used. Norway and Germany have decided to donate the vaccines to countries, which cannot afford to buy the vaccines.

Professor for virological diseases at the central Danish hospital, Rigshospitalet, Jens Lundgren, says: "My first thought is that the developing countries have greater problems to fight than this flu. If you really want to do something for the developing countries, you should probably do something else,” says Jens Lundgren.

Claus Hancke, a medical doctor who is specialized in ordinary medicine, is also wondering:

"From my point of view the developing countries have no need whatsoever for H1N1 vaccine. Flu is a minor problem in countries where there is a lot of sunshine. Furthermore it has turned out, that the swine flu is not particularly dangerous,” says Claus Hancke, adding:

"It seems we would like to find a solution to the problem of waste, and are doing so by sending the surplus vaccine to the developing countries. Following this logic it seems to be better to inject the waste into people instead of destroying it. It is grotesque,” says Claus Hancke, who early on has advised people not to take the vaccine as the H1N1 jab is not properly tested and possibly may have unknown sideeffects.

WHO Survey?

WHO has conducted workshops in all regions to help the countries to establish plans for pandemics and prepare for the arrival of the vaccines. The plans for the pandemic contains instructions concerning who is going to receive the vaccine, how it is going to be administered and the recommendations to inoculate health staff first of all.

Still the administration of the vaccine is the greatest challenge, believes Tom Jefferson from the Cochrane Center.

"It is extremely important to be able to monitor new medicine when you dump millions of doses on a society. You have to survey both for effect and side effects, and how is that supposed to be done in Afghanistan?” he says and elaborates:

"The best explanation I can imagine is that WHO is trying to reduce the enormous stocks of H1N1. The greatest loser in this story about the pandemic is the credibility of the public health systems and the WHO. We are going to pay an enormous price for this when we one day have a real crisis in public health, and nobody trusts the health system any longer.

Credibility is the true victim”.

No further import of vaccines possible

BLIC // The Flu Case, 25 December 2009, 08:25h
http://english.blic.rs/Society/5736/No-further-import-of-vaccines-possible (deleted)
https://web.archive.org/web/20100102012159/http://theflucase.com/index.php?option=com_content&view=article&id=2411%3Aserbia-set-to-cancel-swine-flu-vaccine-contract-with-novartis-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Serbian government is set to cancel its contract for swine flu jabs with swiss-based Novartis after most peole shunned the shot even though the campaign has just begun, report local media.

Poor response to vaccination makes purchase of vaccines senseless. No further import of vaccines possible

If response to vaccination against the new flu continues to be so poor, the Working group for pandemic shall after the New Year suggest to the Ministry of Health to cancel the agreement with the Swiss manufacturer 'Novartis' over purchase of the vaccines.

If that happens, the group shall also suggest ban on public gatherings in order to prevent spreading of the virus, Doctor Predrag Kon, President of the Working group says for 'Blic'.

According to his words, three cases of negative effects have been reported until so far, a woman, an older man and a young man. They all are well now and the cause of the negative effects is still being investigated.

Serbian opposition refuses flu vaccines, boycott ruling power

FOCUS, 25 December 2009, 13:02
https://web.archive.org/web/20091227192533/http://www.focus-fen.net/index.php?id=n204549

DANAS: Belgrade. MPs of the opposition parties in the Serbian parliament refused to get a vaccine against the new flu virus, Serbian Danas newspaper writes.

The opposition says the refusal is a mark of boycott against the ruling coalition and that they have not taken official decision not to get a vaccine on party level.

Some of the reasons for the boycott include the disputable tender for vaccines' delivery, the unnecessary spending of money for a mediator in the delivery and the fact that there are not enough vaccines delivered to Serbia so as to cover the riskiest groups of citizens in the country.

UK medics keep wounded troops alive in Afghanistan's Desert of Death

The Guardian, 27 December 2009 00.06 GMT
https://www.theguardian.com/world/2009/dec/27/british-medics-save-troops-afghanistan

More and more British troops are being saved at Camp Bastion in Afghanistan as Taliban steps up its assaults

They are known by the medics at Camp Bastion as "Holy Shit Sundays", the darkest day of the week when the Taliban are most likely to strike. A popular theory going round the British forces' headquarters in Afghanistan holds that the Taliban stop for Friday prayers, plan their attacks on Saturday and carry them out the following day. And they are doing so with increasing regularity.

Traditionally at this time of year, there is a lull in the fighting as temperatures fall well below zero at night and the tree-lined "green zone" that runs like a spinal cord through Helmand province is replaced by mud, stripping the Taliban of cover. But despite the onset of winter recent Sundays have seen an increase in attacks on British forces in Afghanistan's most notorious province.

As winter rain turns the dust coating Camp Bastion into a treacly yellow sludge, festive cheer is in short supply. The best Christmas gift the medical teams can hope for is a lack of work.

"Any day we're sitting on our arses getting bored stiff is a good one," said Captain Simon Cook, who works with the resuscitation team at the camp. Sipping tea in a storage room-turned-canteen in the surgery unit, he adds: "It means our guys aren't getting hurt."

But these days are rare. More than 1,300 British troops have been killed or wounded in Afghanistan since operations began in 2001, with 104 fatalities and more than 430 injured so far this year. "The enemy is breaking new ground with their improvised explosive devices, but so are we with our treatment," says Colonel Peter Gilbert, commanding officer of Camp Bastion's Territorial Army unit, 256 Field Hospital.

"We see injuries that soldiers would definitely have died from a few years ago. Men who step on IEDs [improvised explosive devices] are losing one or both of their legs or arms and suffering major chest and abdomen injuries. The IEDs are getting worse, but I'm deeply proud of how many soldiers the team is saving."

Gilbert, who normally works as a GP in Kent, oversees 90 NHS medics. Supported by 60 US Navy medics, the 256 unit treats all seriously wounded British troops, the international coalition and the Afghan National Army, in state-of-the-art surgery and trauma units.

...

The biggest fear is a camp-wide outbreak of swine flu or diarrhoea and vomiting which, left unchecked, could affect operations. All British soldiers have been *offered the swine flu vaccine*. ...

WEBTELEVISION SOUVERAINISTE

Christian Cotten

Roselyne Bachelot assignée en référé le 4 janvier 2009 au TGI de Paris

WebTeleLibre, 26 December 2009.
https://web.archive.org/web/20091226035507/http://www.webtelelibre.levillage.org/index.php?option=com_content&task=view&id=2096&Itemid=40

Madame Roselyne Bachelot, Ministre de la Santé, a reçu vendredi dernier une assignation à comparaître en référé devant le Tribunal de Grande Instance de Paris le lundi 4 janvier prochain à 9 h, aux fins de mettre un terme dans les plus brefs délais à la campagne de vaccination contre la grippe H1N1.

Cette procédure judiciaire a été engagé, devant le « danger imminent » encouru par la population, par l'Association Cri-Vie (Coordination de Recherche et d'Informations Indépendantes en matière de Santé), présidée par le Dr Marc Vercoutère (Pau, Pyrénées-Atlantiques) et le parti politique d'extrême-centre Politique de Vie, présidé par Christian Cotten (St-Aubin, Essonne), psychosociologue, ont engagé.

Dans un climat de psychose entretenue par certains experts avec la dramatisation de «quelques morts spectaculaires» (selon le Pr Daniel Floret), les français subissent la promotion commerciale du Tamiflu – source de résistances et de détresse respiratoire aiguë – et celle des vaccins pandémiques hautement toxiques dont l'autorisation de mise sur le marché a été accordée trop rapidement malgré la notion de plusieurs hépatites auto-immunes sur les 400 enfants testés et de nombreuses maladies auto-immunes chez l'adulte en rapport avec le squalène (rapports de la FDA, février 2009 et de l'Agence européenne du médicament : EMEA). Malgré une sous-notification importante, le premier bilan de l'EMEA du 17 novembre fait d'ailleurs état de 55 décès après la vaccination de 5,7 millions de personnes, alors que les autorités s'attendaient à 5,75 décès pour 10 millions de vaccinés. Ce rapport bénéfice/risques déjà défavorable – à court terme – le sera beaucoup plus avec le déclenchement à moyen et à long terme de troubles neuropsychiques (Autisme, hyperactivité…) et «de dizaines de milliers de pathologies auto-immunes, imputées ou non au vaccin, comme les scléroses en plaques (SEP) avec le vaccin hépatite B» (Pr Marchou, CHU Toulouse). Entre 1994 et 2008, la fréquence des seules SEP était passée de 20 000 à 83 000 cas.

Alors qu'elle n'était intervenue que plusieurs années après la survenue des scandales passés, la justice française a l'opportunité de suspendre cette vaccination inefficace ainsi que l'utilisation des antiviraux avant qu'un collège d'experts indépendants n'évalue les réels effets du Tamiflu et de ces vaccins et ne propose des moyens simples et sains de prévention et d'accompagnement de la grippe.

Notre justice ne peut davantage ignorer que l'OMS, les officiels de Santé Publique et les compagnies pharmaceutiques ont construit une machine mondiale de propagande au sujet de pandémies imminentes. Mme Chan, directrice de l'OMS, a ainsi déclaré l'alerte pandémique de niveau 6 en suivant les conseils éclairés d'experts inféodés aux lobbies pharmaceutiques. C'est le cas des Prs Bruno Lina, président en France du GEIG, financé à 100% par les fabricants de vaccins contre la grippe et Osterhaus, conseiller en chef pour les questions de virus pour le gouvernement Britannique et

Hollandais,expert-clé du SAGE (Strategic Advisory Group of Experts Président du European Scientific Working group on Influenza (ESWI) financé exclusivement par les géants pharmaceutiques, fabricants de vaccins.

Tandis que la Pologne a refusé de commander de tels vaccins, Igor Barinov, Président de la Duma a, de son côté, interpellé l'ambassadeur russe auprès de l'OMS à Genève pour qu'une enquête officielle soit lancée concernant les témoignages et preuves de corruption massive au sein de l'OMS. Il a demandé qu'une investigation fasse la lumière sur les liens financiers entre les experts de l'OMS en charge de la pandémie grippale et les firmes pharmaceutiques. Si la corruption est établie, la Russie envisage de se retirer de l'OMS. « Il est urgent qu'une commission internationale d'enquête puisse être mise sur pied, a-t-il déclaré. (Der Spiegel, 12/12/09)

Les auteurs de l'assignation et leurs avocats Maîtres Malika Ouarti (Barreau de Paris) et Jean-Pierre Joseph (Barreau de Grenoble) invitent journalistes et citoyens à assister en nombre à cette audience publique de référé qui se tiendra le lundi 4 janvier à 9 h du matin, au TGI de Paris, 4 bd du Palais (75001 PARIS), au cabinet du vice-président Emmanuel Binoche, avec les avocats des parties.

Berliner Morgenpost

Berlin bleibt auf Schweinegrippe-Impfung sitzen

Berliner Morgenpost, 27 Dezember 2009, 13:09
https://www.morgenpost.de/berlin/article104977421/Berlin-bleibt-auf-Schweinegrippe-Impfung-sitzen.html

Die geplanten Impfungen gegen die Schweinegrippe könnten für das Land Berlin teuer werden. Da die Berliner sich weit weniger immunisieren ließen als erwünscht, lagern nun hunderttausende Impfdosen ungenutzt im Berliner Apothekenlagern und Arztpraxen. 2010 werden womöglich 1,4 Millionen weitere geliefert. Werden sie nicht verbraucht, bleibt das Land auf den Kosten sitzen: 13 Millionen Euro.

Die große Impfaktion gegen die Schweinegrippe kann das Land Berlin bis zu 13 Millionen Euro kosten. Denn die Krankenkassen bezahlen die Impfung nur, wenn Ärzte das Serum Patienten auch spritzen. Bleibt es in der Hauptstadt bei der gegenwärtigen Impfmüdigkeit, muss das Land die Rechnung für seine großen Impfvorräte selbst begleichen. Bisher hätten sich schätzungsweise erst 120.000 bis 130.000 Berliner gegen die Neue Grippe immunisieren lassen, sagte Berlins Infektionsschutzbeauftragte Marlen Suckau.

Zurzeit gibt es rund 285.000 Impfdosen im zentralen Berliner Apothekenlager, bis zu 140.000 Impfdosen lagern darüber hinaus in Praxen. Wird keine neue Mengenabnahme der Bundesländer ausgehandelt, bekommt Berlin im kommenden Jahr automatisch weitere 1,4 Millionen Dosen Impfstoff geliefert. Eine Dosis kostet rund 8 Euro. Werden all diese Vorräte nicht verimpft, entstehen dem Land mehr als 13 Millionen Euro Kosten.

Nach den langen Erfahrungen mit der saisonalen Grippe rechnet Suckau jedoch im Januar und Februar mit einer neuen Schweinegrippe-Welle. Damit werde auch das Interesse an der Impfung wieder zunehmen, schätzt sie. Der Impfstoff sei zwei Jahre haltbar. Zurzeit laufen Verhandlungen, ob die Bundesländer angesichts des milden Verlaufs der Schweinegrippe so viele Impfdosen wie vereinbart abnehmen müssen. Wird die Zahl nach unten korrigiert, sinken auch die Kosten für die Länder.

Bisher gibt es rund 8000 bestätigte Schweinegrippe-Fälle in Berlin. Vier Menschen starben in einem zeitlichen Zusammenhang mit der Infektion. Das ist wenig im Vergleich mit der "normalen" Grippe, die jedes Jahr durchschnittlich 10.000 Menschen in Deutschland das Leben kostet.

"Ich finde nicht, dass der Bund oder die Länder bei der Schweinegrippe überreagiert haben", urteilte Suckau. Der Staat habe nun einmal einen Vorsorgeauftrag. "Und Vorsorge kostet Geld. Wenn wir das nicht machen würden, gäbe es zu Recht Beschwerden." Die Impfmüdigkeit wundert sie hingegen nicht. Die Berliner Bevölkerung sei nun mal gelassener.

Suckau wertet den Umgang mit der Neuen Influenza in Berlin bisher als Erfolg. "Das Management der Pandemie ist bis zum Start der Impfung bilderbuchmäßig gelaufen", sagt sie. Den Beginn der Impfaktion sieht sie im Rückblick allerdings kritisch. "Das ist ein wunder Punkt." Denn es gelang dem Land nicht, sich mit der Kassenärztlichen Vereinigung (KV) auf ein Honorar pro Spritze zu einigen. Stattdessen musste das Land in wenigen Tagen Einzelverträge mit niedergelassenen Ärzten schließen, die impfen wollten. Das gab es sonst nur in Bremen und Schleswig-Holstein.

"Ich finde es bedauerlich, dass wir mit der KV in dieser Situation über 2 Euro mehr diskutieren mussten. Da hätte ich mehr Solidarität erwartet", sagte Suckau. Für die Zukunft sei das Problem der Interessenspolitik noch nicht ausgeräumt. Ein Manko war nach Suckaus Ansicht auch die erste Berliner Internet-Information über niedergelassene Ärzte, die impfen. In vielen Praxen gab es zum Zeitpunkt der Veröffentlichung im Netz noch kein Serum. "Daraus haben wir gelernt", sagte sie.

Die Pandemie-Planung seit 2006 hält Berlins Infektionsschutz-Beauftragte dennoch für einen Glücksfall. "In der Regel überrollt es einen kalt", sagt sie. Dass ein neues Virus im April identifiziert werde und im Oktober ein Impfstoff da sei, das habe es noch nie gegeben. In der Regel dauere auch das Aushandeln von Impfvereinbarungen 2 bis 3 Jahre. In Berlin seien in der heißen Phase nur wenige Wochen dafür geblieben. Von den anfänglichen Pannen abgesehen habe sich die Bevölkerung zügig impfen lassen können.

Große Alternativen für künftige Massenimpfungen sieht Suckau für Berlin nicht. "Wir sind auf die rund 6000 niedergelassenen Ärzte angewiesen. In den Gesundheitsämtern haben wir nur 280 Mediziner." Genaue Lehren aus der Schweinegrippe-Impfung will Berlin nach einer detaillierten Auswertung im kommenden Jahr ziehen.

Berliner Morgenpost

Schweinegrippe könnte Berlin 13 Millionen kosten

Berliner Morgenpost, 27 Dezember 2009, 13:11

Le rythme des vaccinations contre la grippe A(H1N1) ralentit

Reuters, 28 December 2009, 8:53 PM GMT+8
https://www.reuters.com/article/ofrtp-grippe-france-vaccination-20091228-idFRPAE5BR0DX20091228/

Paris (Reuters) **-** Le rythme des vaccinations contre la grippe A(H1N1) a très nettement ralenti en France durant la semaine de Noël, annonce le ministère de l'Intérieur.

Quelque 250.000 personnes ont été vaccinées la semaine dernière alors que sur les trois premières semaines du mois de décembre, le rythme était d'environ un million de vaccinations hebdomadaires, a indiqué Gérard Gachet, porte-parole du ministère, lors d'un point de presse.

Plus de 4,6 millions de personnes sont vaccinées en France contre la grippe A(H1N1).

Les centres de vaccination étaient quasiment tous fermés le dimanche 27 et aucun centre ne sera ouvert de l'après-midi du jeudi 31 au samedi 2 janvier au soir.

Une deuxième campagne de vaccination en milieu scolaire sera lancée à partir du 5 janvier, a confirmé le ministère.

La campagne au sein des grandes entreprises sera mise en place "début janvier" et une trentaine d'entreprises se sont dites intéressées à ce jour, a précisé Gérard Gachet.

THE FLU CASE

Swine Flu Vaccination Campaign Stalls in France Again

The Flu Case, 29 December 2009
https://web.archive.org/web/20100102051249/http://theflucase.com/index.php?option=com_content&view=article&id=2430%3Aswine-flu-vaccination-campaign-stalls-in-france-again&catid=1%3Alatest-news&Itemid=64&lang=en

The number of people going to take their swine flu vaccination in France has dropped dramatically in the last week of December to about 250,000 people, according to a report in Les Echos.

A surge in French people taking the jab was recorded from the start of December when about one million people a week went for the untested jab, following intense media and government pressure.

More than 4.6 million people in France are now vaccinated. However, a recent opinion poll showed that 76 % do not intend to get the swine flu shot.

WELT

In einem Jahr keine separate Schweinegrippe-Impfung mehr

Welt // Morgen Post, 29 Decembre 2009
https://www.welt.de/News/article104924181/In-einem-Jahr-keine-separate-Schweinegrippe-Impfung-mehr.html
https://www.morgenpost.de/printarchiv/wissen/article104974784/Schweinegrippe-Kuenftig-keine-separate-Impfung.html

Berliner Morgenpost

In einem Jahr wird aus Sicht des Infektionsmediziners Christoph Lübbert aus Halle nicht mehr gesondert gegen die sogenannte Schweinegrippe geimpft werden müssen.

"Über einen längeren Zeitraum gesehen wird die Schweinegrippe ein Bestandteil der saisonalen Influenza werden", sagte Lübbert im Nachrichtenradio MDR info. Das werde sich auch im Impfstoff widerspiegeln, der dann gegen beide Grippearten eingesetzt werden könne.

Zuvor hatte bereits Hessens Gesundheitsminister Jürgen Banzer (CDU) betont, Ziel sei es, künftig eine gemeinsame Impfung gegen die saisonale Grippe und die Schweinegrippe anzubieten. Die Schweinegrippe-Welle ist aus Sicht Lübberts derzeit weitgehend abgeklungen. "Es gibt zwar noch vereinzelte Neuinfektionen, die eigentliche Welle ist aber durch", sagte er. Sie sei weniger dramatisch verlaufen, als viele Experten vorhergesagt hätten.

Lübbert empfahl Risikogruppen dennoch, sich jetzt noch impfen zu lassen, wenn dies bisher nicht geschehen sei. "Es kann niemand vorhersagen, ob es nicht im Februar oder März eine weitere Grippewelle geben wird. In den vergangenen Jahrzehnten kam es immer wieder vor, dass auf eine moderate Welle im Herbst eine heftigere Welle im Frühjahr folgte."

In Deutschland sind nach Angaben des Robert-Koch-Instituts (RKI) bislang etwa 120 Menschen nach einer H1N1-Infektion gestorben. Zuletzt hatte sich den Angaben zufolge die Zahl der wöchentlichen Neuinfektionen von fast 8700 auf 4000 mehr als halbiert. Mitte November wurden in einer Woche mit annähernd 47 000 Fällen die bislang höchste Zahl gemeldet. Bundesweit hat es bisher mehr als 200 000 Fälle der neuen Grippe gegeben. ddp

THE FLU CASE

Swine Flu to Become Part of Regular Seasonal Flu Shot Programme

The Flu Case, 28 December 2009
https://web.archive.org/web/20100102021239/http://theflucase.com/index.php?option=com_content&view=article&id=2418%3Aswine-flu-to-become-part-of-regular-seasonal-flu-shot-programme&catid=1%3Alatest-news&Itemid=64&lang=en

A German infectious diesease specialist Christopher Lübbert has predicted that the swine flu jab is going to become an integral part of vaccinations against the seasonal flu in a year’s time in an interview with MDR radio in Halle.

Swine flu: vaccination campaign to begin on Wednesday

Ennahar, 29 December, 2009, 01:27:00
https://web.archive.org/web/20100304212503/http://www.theflucase.com/index.php?option=com_content&view=article&id=2429%3Aswine-flu-vaccination-campaign-to-begin-in-algeria&catid=1%3Alatest-news&Itemid=64&lang=en

Algiers: The national swine flu vaccination campaign will be launched on Wednesday 30th December 2009, the Ministry of Health, Population and Hospital Reform announced on Tuesday.

The vaccination *campaign will be carried out in six phases to cover public and private health personnel, pregnant women, staff involved in core and strategic activities, all* patients suffering from chronic diseases, children and teenagers over six months to 14 years of age, and the entourage of infants under six months of age.

The 1st phase scheduled to begin on 30th December 2009 will cover all public and private health personnel, whereas the 2nd phase targeting pregnant women will be launched on Wednesday 6th January 2010, said the source.

Grippe A: Nicolas Sarkozy appelle à une intensification de la vaccination

Le Nouvel Obs, 28 novembre 2009, 18h18
https://www.nouvelobs.com/sante/la-grippe-a/20091128.OBS9037/grippe-a-nicolas-sarkozy-appelle-a-une-intensification-de-la-vaccination.html

Le président annonce l'ouverture d'un plus grand nombre de centres de vaccination avec des plages horaires élargies. Le chef de l'Etat estime qu'il faut "prendre au sérieux" l'épidémie.

Nicolas Sarkozy a affirmé, vendredi 27 novembre, que les autorités allaient "ouvrir un plus grand nombre de centres" de vaccination contre la grippe H1N1 en France, en marge du sommet du Commonwealth auquel il a participé, à Port-of-Spain (Trinidad-et-Tobago). Il veut aussi "élargir les plages d'ouverture" des centres, notamment les mercredis et samedis, "qui sont des moments pour les familles de disponibilité". Le chef de l'Etat a appelé à "prendre au sérieux cette épidémie de grippe" et considère avoir "anticipé ce problème qui concerne d'ailleurs le monde entier" en ayant "acheté des millions de vaccins". "Dans les journaux, il y avait des sondages disant: "les Français ne croient pas à la grippe et ne veulent pas se faire vacciner". Trois jours après, il y a la queue dans les centres de vaccination", a-t-il fait remarquer, confiant que lui-même envisageait de se faire vacciner prochainement.

"Gardons notre sang-froid"

Le président de la République a donc confié cette tâche au ministre de l'Intérieur et à la ministre de la Santé, précisant qu'"un peu plus de la moitié (des centres sont) ouverts sur un potentiel d'un peu moins de 1.200". Roselyne Bachelot a de son côté appelé vendredi au "civisme de chacun" pour permettre aux personnes fragiles de se faire vacciner selon l'ordre de priorité établi le gouvernement. Enfin, Nicolas Sarkozy a rappelé que "gouvernement comme médias, on doit garder notre sang-froid, faire en sorte de ne pas surréagir en permanence en disant un jour blanc, l'autre noir". "Aujourd'hui en France, 750.000 personnes ont été vaccinées. Les demandes sont très nombreuses depuis quelques jours. L'épidémie est une réalité", a-t-il ajouté.

Le Journal du Dimanche

Grippe A: Nicolas Sarkozy vacciné

Le Journal du Dimanche, 29 December 2090.
http://www.lejdd.fr/Societe/Sante/Depeches/Grippe-A-Nicolas-Sarkozy-vaccine-159882/

Lors d'une visite au Centre hospitalier intercommunal de Créteil en banlieue parisienne mardi, le président de la République a annoncé s'être fait vacciner. "Mais bien sûr, je ne peux pas dire aux gens vaccinez-vous et ne pas le faire moi-même !", a-t-il répondu. "On a vacciné un peu plus de quatre millions et demi de personnes. Il faut continuer, avec le froid qui revient, à faire cet effort de vaccination de masse face à cette grippe".

THE FLU CASE

After Obama, Sarkozy says he Gets Swine Flu Jab

The Flu Case, 28 December 2009, 11:55
https://web.archive.org/web/20100220011855/http://www.theflucase.com/index.php?option=com_content&view=article&id=2416%3Aafter-obama-sarkozy-says-he-gets-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

Following President Barack Obama, French President Nicolas Sarkozy has claimed to have gotten the swine flu jab over Christmas during a visit to a hospital in Creteil, a suburb of Paris.

Mexican Archaeologist Felipe Solis died from the swine flu one day after meeting Obama at the very start of the „pandemic“ outbreak in Mexico City in April, according to Bloomberg.

Obama was not checked for his doctors for swine flu, according to his own staff and has waited until now for his vaccination against the so-called infectious disease.

Les Echos

Grippe: la campagne de vaccination au ralenti

Les Echos, 29 December 2009
http://www.lesechos.fr/info/sante/020288801949.htm?xtor=RSS-2055 (deleted)

Quelque 250.000 personnes ont été vaccinées la semaine dernière, alors que, sur les trois premières semaines du mois de décembre, le rythme était d'environ 1 million de vaccinations hebdomadaires. Plus de 4,6 millions de personnes sont désormais vaccinées en France contre la grippe A (H1N1).

Les centres de vaccination étaient quasiment tous fermés le dimanche 27 et aucun centre ne sera ouvert de l'après-midi du jeudi 31 décembre au samedi 2 janvier au soir, ce qui laisse augurer une nouvelle semaine très calme.

Une deuxième campagne de vaccination en milieu scolaire sera toutefois lancée à partir du 5 janvier. Le gouvernement vise aussi la mise en place, début janvier, de campagnes au sein des grandes entreprises. Une trentaine d'entreprises se sont dites intéressées à ce jour.

THE FLU CASE

Swine Flu Vaccination Campaign Stalls in France Again

The Flu Case, 29 December 2009, 12:36
https://web.archive.org/web/20100201221015/http://theflucase.com/index.php?option=com_content&view=article&id=2430:swine-flu-vaccination-campaign-stalls-in-france-again&catid=1:latest-news&Itemid=64&lang=en

The number of people going to take their swine flu vaccination in France has dropped dramatically in the last week of December to about 250,000 people, according to a report in Les Echos.

A surge in French people taking the jab was recorded from the start of December when about one million people a week went for the untested jab, following intense media and government pressure.

More than 4.6 million people in France are now vaccinated. However, a recent opinion poll showed that 76 % do not intend to get the swine flu shot.

INDEPENDENT

WHO chief says too early to declare flu victory

Independent, 29 December 2009, 01:00 GMT
https://www.independent.co.uk/life-style/health-and-families/health-news/who-chief-says-too-early-to-declare-swine-flu-victory-5514833.html

World Health Organisation chief Margaret Chan said Tuesday it was too early to declare victory over swine flu and insisted that measures taken to deal with the pandemic were justified.

"I think that we must remain prudent and observe the evolution of the pandemic over the next six to 12 months before declaring victory," she told Swiss newspaper Le Temps in an interview.

Even though the peak of the flu has passed in some countries of the northern hemisphere, such as Canada and the United States, others countries were far from seeing the end, she noted.

"Winter is still long," said the WHO director-general, adding that a precise picture of the flu's impact would not be seen before two years.

The A(H1N1) virus has killed at least 11,516 people since it was first detected in March.

The rapid spread of the bug led the WHO to declare a pandemic in June. However, with most patients showing mild symptoms, the UN agency has been criticised by some for having over-reacted.

Chan defended the WHO's decision to declare a pandemic, saying that the UN agency adopted a "very prudent attitude" on the issue.

"I would never have declared a pandemic if I did not have the certainty of proof pointing in this direction," she said.

The WHO chief added that the agency took into account advice from independent and impartial experts.

"We are neither influenced by countries nor by the industry," stressed Chan.

She conceded however, that there was an issue with communication.

"In terms of communication, there was a big gap between the expectations and the reality.

"Everyone expected that the next pandemic would be launched by the H5N1 avian flu virus which kills 60 percent of infected people. Instead it was brought about by a more benign virus, the H1N1," she said.

Even though the swine flu pandemic has given an opportunity for countries to beef up their flu response systems, Chan said the world was not ready to deal with an avian flu pandemic.

"I say without hesitation: we are not ready at all. I really hope that the world would never have to deal with an avian flu pandemic," she said.

WHO chief yet to be vaccinated against swine flu

ABC CBN News, 30 December 2009, 08:11 pm
https://news.abs-cbn.com/classified-odd/12/30/09/who-chief-yet-be-vaccinated-against-swine-flu
https://www.abc.net.au/news/2009-12-30/no-swine-flu-vaccine-for-who-chief/1193284?pfm=ms

Geneva (AFP) **-** World Health Organization chief Margaret Chan revealed Tuesday that she has yet to be vaccinated against the swine flu virus, which has killed over 11,500 people world-wide.

"I have asked my medical service to enquire where I can go to get my vaccination," she told reporters in Geneva, pointing out that she has just returned from leave.

The WHO director-general stressed that she would "of course" get vaccinated and that "many of my staff" at the WHO have already taken their jabs against the A(H1N1) virus.

Many countries rolled out their vaccination programmes over the past two months, but the take-up rate has been lower than expected.

Germany said in early December it wants to sell spare vaccines to other countries, while Switzerland said in mid-December that it would give away part of its stock to developing countries and sell another part to countries that are still trying to procure vaccines.

Mandatory Influenza Vaccinations: An Example of Health Promotion Theater

Global Health Governance, 2010, 4(1) // January 2010
http://www.ghgj.org // https://www.researchgate.net
https://www.researchgate.net/publication/261134803_
Mandatory_Influenza_Vaccinations_An_Example_of_Health_Promotion_Theater

In 2009, New York became the first state to issue a policy requiring health care personnel to obtain influenza vaccinations. This law can be described as "health promotion theater," a term introduced to describe health policies that have good intentions but carry negative outcomes. Moral panics have produced crime control policies with similar characteristics; called "crime control theater." The proposed notion of "health promotion theater" is derived from and compared to "crime control theater." In this article, moral panic over the H1N1 virus is introduced as the policy's catalyst, "health promotion theater's" components are defined, and alternative solutions are offered to more effectively achieve the policy´s ultimate intent. Finally, educating policymakers is offered as a way to avoid laws that are essentially "health promotion theater."

Introduction

On August 13, 2009, New York became the first state to issue a policy requiring individuals working in health care settings to obtain annual influenza vaccinations. The new flu vaccine requirement was filed with the Secretary of State as amendment 3 to part 66 (Subpart 66-3) of New York's public health law. Mandating vaccinations for health care personnel, staff, workers, and volunteers, this new law is intended to "promote the health and safety of the patients they serve and support efficient provision of services".[1] The possible implications of this recent legislation have not yet been fully analyzed from an academic perspective. Incidentally, the outcomes likely will not be realized in the near future because, on October 16, 2009, the mandate was halted by the state's health commissioner[2] due to an inadequate supply of both seasonal and H1N1 ("swine flu") vaccines. The suspension may be fortunate, however, as it provides more time to analyze the possible effects of this policy.

New York is merely awaiting the right circumstances until the policy may go back into effect, as the mandate represents an *annual* requirement. Hence, it is a law laden with major implications that ought to be examined thoroughly before it inevitably goes back into effect. A thorough analysis may help policymakers and health care professionals assess the pros and cons of this law.

This article will first describe the new law. Next, the "moral panic" over the H1N1 virus will be introduced as the triggering catalyst behind the new law. Similar moral panics are discussed, along with the effects of policies that have resulted in response to moral panics in the past. Reactionary responses to moral panics over crime have led to polices termed *crime control theater.* The term "theater" indicates that they *appear* to be effective, but it is unlikely that they actually are. Similarly, some laws designed to address health issues have similar "theatrical" properties. The proposed notion

of *health promotion theater* is thus derived from, and compared to, *crime control theater*. Using this particular legislation as an example, this article defines the components of *health promotion theater*. Numerous predictions are then expressed about the potential problems associated with the new law, which indicate that this new public health law is likely *health promotion theater*. Some alternative solutions are offered to more effectively ensure the vaccination of health care personnel. Finally, educating policymakers is recommended; and this article will suggest that this may be achieved by researchers and experts in all fields initiating partnerships and working alongside policymakers to prevent the implementation of policies that are likely *health promotion theater*.

Subpart 66-3 in Detail

New York's new public health law, Subpart 66-3, went into effect on August 13, 2009, and required individuals who work in health care settings to be vaccinated for both seasonal flu and the H1N1 influenza A strain virus (commonly referred to as "swine flu") by November 30, 2009.[3] This law is the first of its kind, as there is no similar state-wide policy mandating the vaccination of working adult populations. The Department of Health gave the following rationale in the amendment's "Emergency Adoption Justification" section:

> Influenza disease is a leading cause of morbidity and mortality among hospitalized patients and those admitted to other types of health care facilities. This fact, plus the new threat posed to health and safety by the novel H1N1 influenza A strain that is circulating in New York State, puts a need for emergency regulations requiring that all health care personnel be immunized against influenza annually.[4]

Vaccination and immunization are used interchangeably throughout the amendment in reference to seeking shots. However, for the purposes of this paper, vaccination will be the word used consistently. The term health care personnel refers to anyone (whether paid staff or volunteer) who has direct contact with patients in health care facilities such as hospitals, treatment centers or homes.

The law places the financial burdens associated with the vaccinations on each individual health facility. A rough cost and benefit analysis is presented by the state positing that the institutional costs of complying with the mandate "should be modest" and "more than offset by cost savings to the facility."[5] It is estimated that the cost of vaccinating each health care personnel will be minimal, compared to the monetary savings gained from lower levels of absenteeism and fewer workdays disrupted by sick employees working below their maximum potential. In addition, the spread of influenza among patients will decrease, thereby improving the quality of health care and patient outcomes. The state posits that vaccinating its staff will decrease both direct and indirect costs to health care facilities in the long run.

However, the legislative action is not currently in effect. On October 16, 2009, just two months after the law's passage, the requirement was temporarily suspended because of a vaccine shortage caused by the sudden spread of the H1N1 virus. The assumed "emergency" situation posed by the H1N1 virus not only caused a vaccine shortage, but also happens to be responsible for the swift passing of this public health law. In the following section, moral panic over the H1N1 virus is credited with bringing about this piece of legislation.

Moral Panic

Moral panic, in response to the recent H1N1 outbreak, is a viable explanation for the quick adoption of New York's recent public health law. The law directly addresses the moral dilemma of responsibility and advocacy concerning national health and wellbeing. Who will act on behalf of citizens at risk? It is deemed the moral obligation of health care providers and policymakers to promote the wellbeing of their society. Thus, it may be unacceptable and even unethical for them to idly stand by at such a critical time. H1N1 has been deemed a unique health threat that is more dangerous than other seasonal strands. As such, H1N1 creates a number of dilemmas for policymakers

and health care workers. First, it seems "wrong" to stand by and do nothing; thus, those in authority must do whatever is "right" and necessary to stop the spread of the virus. Second, many people would think it obvious that health care providers would be eager to do their part by getting vaccinated. Health care professionals could be said to have a heightened responsibility to help prevent a health epidemic. Thus, laws such as the New York law are enacted to ensure that health care providers make the morally responsible choice: to seek vaccination.

As discussed next, recent alarm over the spread of the H1N1 virus fits the criteria for a moral panic, and that concern led to the adoption of this law. The phenomenon of moral panic occurs when:

> A condition, episode, person or group of persons emerges to become defined as a threat to societal values and interest; its nature is presented in a stylized and stereotypical fashion by the mass media; the moral barricades are manned by editors, bishops, politicians and other right-thinking people; socially accredited experts pronounce their diagnoses and solutions…[6]

Moral panics need not be responses to novel occurrences; they can be manifested as new constructions of re-emerging incidents in the past,[7] as the case with the H1N1 virus. Examples of moral panics throughout history include: freeway violence, road rage, satanic cult panics, cyberporn, school violence, child abuse in day cares, and child abduction. All of these examples share five essential elements that qualify them as moral panics. These elements are: concern, hostility, consensus, disproportionality, and volatility.[8] All five of these elements can be observed within the context of the recent H1N1 pandemic.

The first indicator of a moral panic is widespread public concern about the consequences of the target behavior or condition.[9] Generally, concern is measured via opinion polls, media attention, action groups, or proposed legislation. This indicator of moral panic is often observed in heightened levels of public concern. Reactions to the recent H1N1 pandemic fit this description. President Obama's reference to the H1N1 pandemic as a "cause for concern" was repeated numerous times by various news stations. Similarly, newspapers have printed headlines such as "Flu Fears Spur Global Triage" (*Wall Street Journal*); "Nation Braces for Worst as New Strain Emerges" (*USA Today*); "U.S. Steps Up Alert as More Swine Flu Is Found" (Washington Post); and "Hog Wild" (*New York Post*).[10] Further, the Center for Disease Control and Prevention (CDC) has placed a special "H1N1 'Swine Flu'" link on their homepage with up-to-date postings.[11] This concern is exacerbated by worry that health care personnel might not voluntarily get vaccinated. New York's law is an attempt to force health care personnel to make the ethical choice to get vaccinated. It is evident that there is a high level of concern about H1N1 among citizens and authorities.

The second necessary component of a moral panic is an increase in the level of hostile attitudes toward the target. This target must be publicly perceived as harmful and threatening to shared values, interests, or even the existence of a society.[12] Any virus with the potential to claim lives can be considered threatening, thus triggering hostile attitudes. The hostility of citizens toward the H1N1 virus, in particular, was heightened, as evident in online journals and news reports.[13] The CDC reported that, "flu-related hospitalizations and deaths are increasing … and are higher than expected".[14] Pregnant women also happened to be among the most vulnerable to it. Given this vulnerability, hostility has especially been expressed through online blogs by mothers attempting to protect their children from H1N1 infections.[15] There is also hostility toward health care personnel who refuse to get vaccinated. One blogger notes that "an infected health care worker comes in contact with people who are at greatly increased risk…they may endanger [the patient] by their choice not to get vaccinated. If they won't be vaccinated, they shouldn't be allowed to come to work in a health care setting."[16] MSNBC commentator Arthur Caplan wrote an article entitled, "Health Workers Must Get Flu Shot or Quit."[17] It is evident from the various online postings that H1N1 virus – and health care workers who refuse to be vaccinated – have certainly elicited hostility among U.S. citizens.

Consensus is the third element necessary for a behavior, occurrence, condition, or event to qualify as a moral panic. A measure of societal agreement about the reality, seriousness, and threat

of the matter is necessary. However, it is not required that the widespread sentiment necessarily be expressed by the majority of the populace.[18] Public consensus about its unacceptability must also be accompanied by the belief that something ought to be done to address the problem.[19] In the case of the recent H1N1 outbreak, these criteria are likely met. The C.S. Mott Children's Hospital National Poll on Children's Health revealed that 87 percent of the public supports laws that require health care personnel to be vaccinated.[20] According to Gallup polls, 42 percent of women under the age of 50 reported feeling worried about the H1N1 pandemic.[21] Men have consistently shown less concern than women; however, men over 50 with children are twice as likely to be worried about the H1N1 virus as men over 50 without children.[22] This makes sense, as pregnant women, children, and those who are in frequent contact with children are more susceptible to the virus. This data demonstrates there is a stronger consensus among populations who are at high risk. There is also a similar consensus among authorities. The U.S. and several other governments recommended limiting travel, the World Health Organization raised its pandemic alert to the second highest level possible, Phase 5, and the CDC has referred to H1N1 as an epidemic of concern likely to worsen with time.[23] Thus, there is fairly clear consensus that the flu is a serious threat, and that health care workers need to be vaccinated.

The fourth moral panic criterion, disproportionality, means that the level of panic is out of proportion to the nature of the threat.[24] Indeed, the amount of alarm over the H1N1 virus is greater than the actual threat. Between April 2009 and April 2010, the estimated range of deaths due to H1N1 was somewhere between 8,870 and 18,300.[25] Although any number of deaths is a cause for concern, this number is quite low when compared to the Center for Disease Control's estimated 36,000 flu-related U.S. deaths per year.[26] Further, many of the H1N1-related deaths cannot be exclusively attributed to the virus. As with most flu related deaths, the cause is likely a combination of preexisting conditions, such as pregnancy, diabetes, asthma, heart or kidney disease, as well as a weakened immune systems or old age, *along* with the H1N1 virus.[27] In fact, about 70 percent of those hospitalized with H1N1 had medical conditions which placed them in a "high risk" category for flu-related complications.[28] Although panic is high among citizens, only 38 percent of health care personnel indicated planning to seek vaccination against the H1N1 virus,[29] which reflects a possible disproportionality. If such a high proportion of health professionals who come into contact with the virus in their jobs consider the vaccine unnecessary, this may indicate that health care personnel feel that the public's perception of the threat is disproportional to the actual threat. Nonetheless, this particular virus has received an overwhelming amount of media attention and unwarranted concern.

The fifth and final indicator of moral panic is volatility, which is a sudden eruption of alarm over something that could have been latent for a period of time, or has reappeared time and time again.[30] This alarm eventually dissipates and leaves the moral fabric of society relatively unchanged. The 2009 H1N1 pandemic fits this description fairly well. It is, in fact, a reappearing virus. The "swine flu" virus dates back to 1918. Since then, strains and subtypes of this flu have reappeared throughout the twentieth century.[31] Over the years, it has come and gone causing short-lived alarm. Thus, this particular strand will also likely disappear without any unique implications to society as a whole. Similarly, statewide and facility-wide vaccination recommendations for health care workers have fluctuated over the years, often in proportion with the level of alarm over circulating viruses.

Having compared the five elements of moral panic to the current state of the 2009 H1N1 virus, it is appropriate to label this pandemic as a moral panic. There is a heightened level of concern, hostility, and consensus pertaining to the virus (and to health care workers' refusal to get the vaccine) that is quite disproportionate to the reality of its implications; hence the volatility of its emergence, and its predicted retreat. Moral panic associated with these attributes could explain the legal response that New York took in passing this legislation. Although the law itself is unprecedented, the way in which it arose is not a new phenomenon. The formulation of this recent public health law is similar to the adoption of Amber Alert, Megan's law, Jessica's law, and other such laws birthed out of moral panic called *crime control theater*.

Crime Control Theater

Many in the academic community are hesitant to recognize Amber Alert, Megan's law, Jessica's law, and similar legislations as successful. Such laws have been referred to as "*crime control theater,*"[32] which is "a public response or set of responses to crime which generate the appearance, but not the fact, of crime control."[33] Given that they only appear to be effective, they are labeled as "theater."

These sorts of laws tend to be widely supported by the public as a way of addressing the particular crime. Often, such laws are attractive because they appeal to mythic narratives, such as saving children from harm. However, they are unlikely to achieve their intended goals because they are very simple solutions to complex crimes. Further, such laws may even have harmful effects and can take attention away from more frequent problems that are more easily addressed. Laws that qualify as *crime control theater* generally have four components: a reactionary response to moral panic, unquestioned acceptance and promotion, appeal to mythic narratives, and empirical failure.[34]

Crime control theater was initially developed by Griffin and Miller, using Amber Alert as an example.[35] After a child is abducted, an Alert is issued (e.g., by posting the description of the child, abductor, and/or car on road-side signs) in order to get information to the public in time for community members to see the child and report the sighting to authorities, who can then rescue the child. There is evidence that the assumptions underlying the Alert system are flawed.[36] First, statistics demonstrate that children who are killed by their abductors usually are killed within three hours of the abduction.[37] Other research shows most Alerts are issued much later than three hours, suggesting that Alerts are typically not issued in time to rescue the child.[38] Second, psychological research on memory suggests that the likelihood of an individual seeing, remembering, and retrieving the Alert information at the key time (e.g., when the individual sees the abducted child) is slim.[39] One study specifically investigating memory for Alerts found that only 8.3 percent of participants in a study were able to remember Amber Alert information.[40] This problem is exacerbated when Alerts are not issued with enough information to allow the community to recognize the child.[41] Third, there is concern (although little evidence of yet) that the Alert system may lead to copycat crimes, or may lead an offender to kill a child sooner than intended (out of fear of getting caught).[42] These issues, and various others, explain why many in the academic community are wary about the effectiveness of Amber Alerts, even though the public embraces the system.[43]

Although the four elements of *crime control theater* have previously only been used to describe criminal laws, they are also applicable to New York's vaccination law. This indicates that a new term is needed; this article offers the term *health promotion theater* to explain theatrical laws that attempt to address health promotion issues such as New York's vaccination law.

Health Promotion Theater

Health promotion theater can be defined as a social or policy response (or set of responses) adopted to address a moral panic over a health threat. The response generates the appearance of effectively promoting good health, but fails to actually do so. It is a socially constructed or politically formulated solution to a socially constructed health problem that happens to be more complex than the proposed solution can possibly address. Even so, the public feels a need to "do something" to address this problem; thus the policy chosen is quickly and widely accepted with little question. Despite good intentions, such laws are not always successful. Thus, the key word "theater" implies the appearance or illusion of promoting health, but without substantive evidence of actually achieving that goal. These characteristics are represented by four main components that qualify a policy as *health promotion theater.*

First, a *health promotion theater* policy is a reactionary response to moral panic. The reactionary nature of New York's recent public health law is evident in the dedication of a section in Subpart 66-3 titled "Emergency Adoption Justification."[44] The decision to adopt the law in 2009 rather than in any other year is no coincidence; it is highly attributable to the moral panic caused by the H1N1

virus, as described above. In response to a fear that some health care personnel would not voluntarily get vaccinated, the state took steps to ensure they do the "right thing."

Unquestioned acceptance and promotion of the law is the second component of *health promotion theater*. As with any policy, it is difficult to find absolute consensus among citizens, politicians, laypeople, professionals, and scientists. Therefore, it is necessary to distinguish *which* populations are accepting and promoting the law. This component of *health promotion theater* refers to acceptance among citizens and promotion by policymakers. It is important to point out that nurses, physicians, and health care personnel were *not* among those who demanded any sort of statewide solution to influenza; a law which, ironically, singlehandedly impacts them directly. The public widely supports such laws, as the C.S. Mott Children's Hospital National Poll on Children's Health discussed above demonstrates.[45] While 87 percent of the nationwide sample supported the law, the State Hospital Review and Planning Council quickly drafted and adopted the "emergency" mandate, which indicates that it was relatively unquestioned. The few critics have been medical professionals, not policymakers.

An appeal to mythic narratives is the third component of *health promotion theater.* There is, perhaps, no mythical feat greater than that of saving a life. In the case of this law, the objective is saving the lives of thousands of citizens who could potentially catch the H1N1 or seasonal influenza virus and perish. The most likely victims are children, pregnant women, and the elderly – groups that tend to garner high levels of sympathy. The viruses are the antagonist, the publicly perceived harmful and destructive force that must be stopped. Failure on behalf of health care personnel to get the vaccine further provokes the public to take action to stop a possible "pandemic." The H1N1 virus, in particular, has raised high levels of antagonism, given the CDC's report that, "flu-related hospitalizations and deaths are increasing … and are higher than expected."[46] This emergency calls for a protagonist, a hero, to prevent possible devastation. Consequently, the New York Department of Health boldly accepted the challenge. This all-too-real scenario could very well pass as the plot for a best-selling mythical narrative or the script for a motion picture. It is an epic struggle that appeals to people's sense of self-preservation and need to protect the helpless.

Empirical failure is the fourth and final component of *health promotion theater*. Contrary to the state's estimates, there are several reasons why the costs of this public health law will likely outweigh its benefits. Although the governing body did a cost/benefit analysis, it was limited to monetary costs and benefits. There are other concerns to weigh as well, and these are the focus of this analysis – overlooked factors which lead to the adoption of policies deeming the *health promotion theater* label.

Before delving into the problems, it is necessary to consider the law's purpose: to promote the health of patients and to decrease the spread of influenza in health care facilities. The effectiveness of influenza vaccinations, however, is a controversial matter. Not everyone is convinced that flu shots are the best way to avoid the virus, or that seeking vaccinations is a worthwhile effort. In fact, only about 40 percent of adults seek influenza vaccinations each year.[47] Ironically, that rate is not any different for those in the health profession, as roughly only 40 percent of health care personnel obtain yearly flu vaccinations.[48] There is no comprehensive explanation for why a majority of people neglect getting vaccinated. Explanations range from a lack of vaccine effectiveness, a lack perceived safety, and/or a lack of incentive or reward for getting vaccinated.

Concerning vaccine efficacy, the effectiveness of flu vaccines never reaches 100 percent (and fluctuates depending on how well-matched the circulating viruses are to the accompanying vaccines).[49] Furthermore, flu vaccines happen to be the *least* effective for populations *most* vulnerable to the flu, the elderly, and children. Additionally, some people are wary of vaccines due to safety concerns. In the case of the H1N1, there is heightened alarm over safety due to a class action suit brought against the FDA for hastily approving four H1N1 vaccines without determining their safety or efficacy.[50] That may explain why 30 percent of the population is not confident about the whether the new H1N1 vaccine is actually safe.[51] In fact, about 62 percent of 30 to 64 year olds and 53 percent of senior citizens decided to skip vaccination for the 2009 season.[52] On the other hand, a simpler explanation

for overall low vaccination rates among citizens as well as health care personnel may be that there are no tangible rewards or benefits associated with taking the effort to seek yearly vaccinations. Outside of personal conviction, there is no motivator or incentive compelling individuals to get vaccinated.

There are evident deficiencies in the perceived efficacy, safety, and motivation for seeking vaccinations, to which H1N1 is no exception. For the purpose of this account, however, it will be assumed that annual vaccinations are a generally helpful preventive measure against catching influenza. With that said, even *if* the vaccines themselves are 100 percent effective, this law's success in meeting its intended purpose is *still not guaranteed*. This is because failure is not strictly defined by the absence of achieving a particular result, but involves examining the disproportionality between the costs and benefits (both monetary and non-monetary). Undoubtedly, the law will prevent *some* people from catching the flu, but it carries unnecessary burdens for the state and unintended consequences for individual health facilities. The anticipated benefits are not likely to outweigh the burdens and unintended consequences.

The manpower required to oversee the mandate is a costly and unnecessary burden. Under New York's policy, each facility is required to enforce the vaccination of its personnel, assign punitive consequences to those who do not comply, and report back to the state regularly. This translates to thousands of people being paid to supervise and enforce a law that is likely to worsen the culture of the work atmosphere. When personnel do not comply in a timely manner, punitive actions will not be well received, and will diminish the cohesiveness of the work environment. A worst case scenario of firing noncompliant employees and training new persons will be time-consuming and costly. The compliant, and thus remaining, employees will likely be upset and may show their frustration in ways that distract them from performing their duties.

Noncompliance or reluctant compliance among health care personnel will also inevitably be an issue, as the majority of health care workers regularly choose not to obtain vaccinations.[53] There is no similar state-wide vaccination mandate to compare this to. However, there have been voluntary programs aimed at increasing influenza vaccination rates among health care personnel, and even those have yielded poor vaccination levels.[54] Generally, vaccination rates among health care personnel do not extend beyond 40 percent.[55] This suggests that the solution ought to be anything *but* mandating vaccination. The likely effects of requiring health care personnel to get vaccinated will jeopardize the personnel's perceived freedom of choice and personal control over their health.

Although the law makes provisions for those whose religious beliefs are in opposition to receiving vaccinations, or whose prescription medicine intake is incompatible with the vaccine, this only creates more problems in the workplace. The provision, while well-intended, requires the disclosure of intimate and personal information. It is not only likely, but understandable, that certain personnel may not feel comfortable sharing confidential information, such as religious affiliations or medication they are taking, with their superiors.

The amount of effort, manpower, and monetary commitment required by the law's enforcement, its unintended consequences, and the unavoidable change in the culture of the workplaces affected by the law are likely to outweigh the potential benefits. In other words, it is appropriate to predict the failure of this law on account of the lack in positive changes it will render. Through this new law, the state shows favoritism by seemingly valuing the interests of some citizens over others. It sends the message that protecting its patients from the flu at health facilities is more important than the personal health choices and privacy of its health care personnel at those facilities. Even assuming health care personnel compliance *is* established, it will be reluctant, and at a cost. Deviance can be expected in terms of receiving the vaccination due to diminished appraisals of legitimacy of the state and those institutions cooperating with the policy. This law simply cannot produce enough positive consequences to outweigh the effort and side effects required to sustain it.

In sum, these four components render New York's recent public health law as *health promotion theater,* an illusionary solution to a socially constructed health problem. The law is correctly labeled

by its authors as an "emergency regulation," because it is a reactionary response to the moral panic created by the H1N1 virus. Devoid of any precedence, it sprang up with overwhelming public support and acceptance, and policymakers pushed forth until its adoption. It undoubtedly appeals to various mythical narratives, such as life, good health, survival, self-preservation, and saving lives. Lastly, its overall success is unforeseeable. It will likely fail on account of unexpected consequences; such as noncompliance, high monetary costs associated with the manpower necessary to sustain it, and the negative effect it may produce on the work cultures where implemented.

Alternative Solutions

Given the above mentioned issues with the new law, a false illusion of health care promotion is created. As with any social issue that leads to *health promotion theater*, there are no easy solutions. However, if New York officials are adamant about vaccinations being the solution to the influenza problem, they ought to consider alternative ways of achieving their ultimate goal of vaccinating health care personnel. New York, as well as other states considering following suit, ought to consider implementing these more effective alternatives that do not result in high monetary costs, unnecessary manpower, and negative changes in the work culture. To our knowledge, the alternatives suggested below are not currently practiced in any health setting for the purpose of increasing vaccination rates. However, they have succeeded in motivating behavior change in other settings, as reported by each of the respective references.

Making vaccinations optional and offering rewards for those health care personnel who receive vaccinations could boost vaccination rates without the negative effects described above. Such voluntary recruitment attempts are certainly not a novel idea, and many have been utilized by officials in the past without significant effect.[56] However, the method suggested here is based on two of the six most powerful principles of influence: reciprocation and consistency.[57] Tendencies toward reciprocation, the first principle, are observed across all societies. Reciprocation is the normative gesture of repaying what one has received, be that a reciprocal exchange of gifts, favors, or invites. The reciprocation principle does not only refer to tangible items. Consistency is the second principle, introduced as the notion that public commitments predict future action. Even minor verbal agreements positively influence the likelihood of following through on intentions. These two principles can be merged in such a way as to significantly boost health care personnel vaccination rates.

Traditionally, when offering rewards to people, individuals are asked to *first* meet a requirement (i.e., getting the vaccine) *in order to* get a promised reward. Building off of reciprocation research,[58] however, it is worth trying the opposite; *first* giving individuals a reward or gift and then anticipating their reciprocation (seeking vaccinations). To buffer the vaccination success rate, health facilities should also utilize the second principle of influence, consistency. This principle can be employed simply by asking for commitments, especially public commitments or promises, prior to distribution of the reward/gift stating that the individual *does* plan on following through with his/her vaccination (as a sort of oath to reciprocating the gift). As this will take place in a public setting, the personnel will be held accountable to each other in following through on their commitment. Thus, no oversight is necessary (as people will be socially motivated and held accountable by those whom they care to preserve their reputation in front of).

This method is quite simple. An announcement could be made during a staff meeting about the importance of vaccination, asking the group to seek the shots. The announcement would be followed by asking for an informal public agreement/confirmation succeeded by the distribution of a small in-advance thank you gift to those present. Although there is a gift involved, the focus is on fulfilling the commitment and the gift's reciprocation. Yet, there are no "one-size-fits-all" rewards that will equally motivate all health care personnel to take the effort of seeking vaccinations. Thus, luring personnel with the promise of delivering a gift *upon* their vaccination is a less appealing and less effective method, as it is contingent on the gift's value to each individual. Utilizing this principle, however, the focus is not on the reward, but on enforcing the socially accepted norms of reciprocation and consistency (to which there is generally a stronger pull towards than there may be to an arbitrary

gift). With that said, it matters very *little* what the actual rewards are. Each facility could come up with its own reward ideas. The rewards could be low-cost items such as holiday items, movie tickets, gift cards, or items donated by a company. Such prizes would be less costly than the manpower required by the law to ensure that each staff member is up-to-date on his or her annual vaccinations. Additionally, as opposed to feeling forced to seek vaccination, employees would feel rewarded for doing so.

Health related incentives would be another appropriate means of encouraging health care personnel to seek vaccinations. These incentives could include offering lower insurance co-pays or deductibles for those health care personnel who choose to get vaccinated. Granted, this solution would also require some manpower, but the anticipated satisfaction and positive attitudes among health care personnel in response to these incentives would far outweigh the energy required to sustain such a program. Given that more than three out of four people report being dissatisfied with the cost of health care,[59] this type of incentive has never been more appropriate than now. Given these attitudes, it is likely that health care related incentives would motivate many to seek vaccinations.

Lastly, an entirely free way to promote influenza vaccinations would be to provide seemingly small *group* enticements that are tailored to be meaningful to each individual health care institution. Sometimes motivators targeted at the individual may not be as effective as creating a competitive group atmosphere where *groups*, rather than *individuals*, are challenged with a task. Research on social identity theory shows that intergroup behavior is motivated by an effort between groups at promoting and protecting their positive distinctiveness from other groups, which ultimately leads to secure a positive social identity.[60] This phenomenon occurs because group membership leads to an evaluation of individuals' selves through their social identity, and that often translates to heightened self evaluations as a result of the group experience. This principle can be applied to boost vaccination rates.

Groups need not be artificially created, as various groups (e.g., different specializations, shifts, floors, sections, and units) already exist at health facilities. Upon drawing a criterion that divides the facility into any given number of groups or teams, the goal must be stated (the highest percentage of group member vaccinations). Then there needs to be an established prize for the winning group/team that ought to be meaningfully tailored by each facility. For example, if employee parking happens to be a hassle, whichever group obtains the highest vaccination rate could be assigned closer parking spaces for a limited time. Other rewards could include relaxed dress codes, longer lunch breaks, or donations to the group's choice of charities. These options constitute a low-effort, fun, and enjoyable means of promoting higher vaccination rates *alongside* of building team morale and social validation among the health care personnel.

All of these proposed rewards, incentives, and enticements would achieve the law's goal of increasing the number of vaccinated personnel, *without* negatively impacting the work atmosphere or diminishing the perceived choice over their personal health. Rather, these suggested alternatives would build group solidarity alongside of health awareness, ultimately leading to more satisfied employees and better-served patients.

Avoiding Health Care Promotion Theater

The suggestions above can help promote flu vaccinations within facilities. However, the broader issue is the general prevention of laws that are mere *health promotion theater*. In other words, the question at hand is, "How can we prevent health care policies that only *appear* to tackle an issue, but do little to actually solve it?" The primary way to do this is by educating policymakers, as they are the ones who ultimately create mandates and laws. It is unreasonable to expect politicians to be experts in all fields. Therefore, the responsibility of disseminating applicable knowledge and new research falls on experts in all disciplines. Cynical researchers and experts in all fields ought to not only speak up, but should contact their policymakers. When an issue or "moral panic" arises, academics and experts in that discipline should write letters, initiate dialogue, and publish their research through

venues accessible to the target politicians. This may mean launching interdisciplinary dialogue and networking outside of comfort zones. Experts on a hot-topic issue that is on the brink of causing social alarm ought to be proactive in contacting, and even trying to meet officials for the purpose of disseminating their knowledge. For many in academia, this translates to a shift from policy critiquing to active involvement in policy formulation. All of this ought to be done in a timely matter, *during* rather than after policy formulation, as hindsight criticism does little to impact policy.

Public policy centers can also help by sponsoring seminars which provide neutral, unbiased research for policymakers. This could be modeled after 'family impact seminars,' which have successfully educated policymakers about a wide range of issues in various states.[61] Experts from around the country would gather and present their research in order to help policy makers make the best possible decisions. While policy making bodies likely do some sort of cost/benefit analysis for most mandates and laws, such seminars will provide an unbiased, broad, and multi-disciplinary array of monetary, as well as intangible research-based costs and benefits. Likewise, it would be appropriate for public policy centers, research institutes, or special interest groups to create public service announcements about potentially alarming issues that may be blown out of proportion by the public, triggering hasty legislation. For example, had a union or association of nurses or physicians sought out a way to thwart the inflation of public concern about H1N1, Subpart 66-3 may not have been implemented. Educating the public along with policymakers is the ideal way to craft policy.

Unless experts speak up in time, *health promotion theater*-like policies will continue emerging out of reactionary responses, and premature actions will be utilized to address pertinent issues. Legislation ought to be based on facts and research, not emotion. Weighing the costs and benefits ought to take place with qualified experts involved. Ideally, policymakers ought to be the ones calling in the experts and initiating the necessary partnerships; however, this does not always happen, especially in emergency situations. Therefore, the broader message that this article seeks to advance is the importance of researchers and experts broadcasting their knowledge through different publication venues, open seminars, public service announcements, and primarily though seeking out connections with influential policymakers, as opposed to waiting for an invitation to do so.

Conclusion

There is no doubt that illness is a major concern, and that steps should be taken to avoid illnesses or viruses becoming epidemics. Even so, when policymakers hastily enact responses as a result of moral panic, they risk passing policies that are mere *health promotion theater;* that is, policies that have the appearance of addressing a health issue, but actually may be unsuccessful, or even have negative consequences. Thus, while policymakers should consult experts, the experts likewise ought to seek out policymakers and offer their knowledge and research to help fully evaluate the pros and cons of proposed policies, and ultimately work together toward avoiding the enactment of *health promotion theater.*

Changing your genes

"BIOLOGY is destiny." Though the years have been unkind to Sigmund Freud's thought, that notion sounds fresher now than when he said it. In the 1950s the threads of destiny were given form when Crick and Watson elucidated the double-helix structure of DNA. In the 1960s the language of genes, in which the messages stored on DNA are written, was translated; biology, and much else, began to change. Genes are blamed for everything from cancer to alcoholism. People worry about being made ineligible for jobs because of disease susceptibilities they never knew they had; fetuses are aborted because of faults in their genes; criminals are defined by the bar-codes of their genetic fingerprints.

At first glance, genetic therapy—the nascent art of giving sick people new genes to alleviate their illness—looks like the apotheosis of this trend towards reducing human life to a few short sequences of DNA. But although its advent means people will be talking in the language of genes even more than they already do, the way they talk will change. They will not be passively reading out the immutable genetic lore passed down from generation to generation. They will not be receiving orders; they will be giving them. The birth of genetic therapy marks the beginning of an age in which man has the power to take control of his genes and make of them what he will.

New promises, new threats, old answers

At the moment, gene therapy is a small field on the fringes of medicine and biotechnology. Genes carry descriptions of proteins, the molecules that do most of the body's work; if someone is missing a gene, they will be missing a protein, and may thus suffer a deficiency or disease. If a gene or set of genes runs amok, cancer can result. The gene-therapists aim to provide the body with genes to make good its deficiencies and problems. If their field had grown as fast as the stacks of ethical reports and regulatory procedures that surround it, it would already be big business. As it is, after years of discussion, it is only now starting to blossom. Therapies are being tried on people around the world (though in tiny numbers) and new ways of delivering genes are being devised (see pages 95-97). A torrent of raw material for tomorrow's therapies is flowing from the human ge-

the drug is being made inside the body. There already exist sets of rules for trying out drugs. The question of the drug's provenance is of secondary importance, as long as its manufacture can be shown to be safe. Experimental gene therapy has satisfied regulators on that count, so far.

"So far", though, is only the beginning. Beyond today's gene therapy, which is a specialised form of medicine not that dissimilar to others, lie far more controversial possibilities: changing genes for non-medical reasons, and changing genes wholesale in such a way that the new genes are passed on from generation to generation. At present, therapists aim at genes that are clearly villains, and the therapies last at most as long as the patient, and often only as long as a transient set of cells. But what of genes that might make a good body better, rather than make a bad one good? Should people be able to retrofit themselves with extra neurotransmitters, to enhance various mental powers? Or to change the colour of their skin? Or to help them run faster, or lift heavier weights?

Yes, they should. Within some limits, people have a right to make what they want of their lives. The limits should disallow alterations clearly likely to cause harm to others. Even if the technology allowed it, people should not be allowed to become psychopaths at will, or to alter their metabolism so that they are permanently enraged. Deciding which alterations sit in this forbidden category would have to be done case by case, and in some cases the toss may be passionately argued. But so it is with all constraints on freedom. Minimal constraint is as good a principle in genetic law as in any other.

People may make unwise choices. Though that could cause them grief, it will be remediable. That which can be done, can be undone; people need no more be slaves to genes they have chosen than to genes they were born with. To keep that element of choice, however, one thing must be out of bounds. No one should have his genes changed without his informed consent; to force genetic change on another without his consent is a violation of his person, a crime as severe as rape or grievous bodily harm. There may be subtle social pressures to choose certain traits; but there is often social pressure for all sorts of things, and it does not deny the subject free will.

Children who get Flu vaccine have three times risk of hospitalization for Flu

American Thoracic Society, ScienceDaily, 20 May 2009
https://www.sciencedaily.com/releases/2009/05/090519172045.htm

Summary:
The inactivated flu vaccine does not appear to be effective in preventing influenza-related hospitalizations in children, especially the ones with asthma. In fact, children who get the flu vaccine are more at risk for hospitalization than their peers who do not get the vaccine, according to new research. While these findings do raise questions about the efficacy of the vaccine, they do not in fact implicate it as a cause of hospitalizations, according to researchers.

ATS 2009, San Diego – The inactivated flu vaccine does not appear to be effective in preventing influenza-related hospitalizations in children, especially the ones with asthma. In fact, children who get the flu vaccine are more at risk for hospitalization than their peers who do not get the vaccine, according to new research that will be presented on Tuesday, May 19, at the 105th International Conference of the American Thoracic Society in San Diego.

Flu vaccine (trivalent inactivated flu vaccine – TIV) has unknown effects on asthmatics.

"The concerns that vaccination maybe associated with asthma exacerbations have been disproved with multiple studies in the past, but the vaccine's effectiveness has not been well-established," said Avni Joshi, M.D., of the Mayo Clinic in Rochester, MN. "This study was aimed at evaluating the effectiveness of the TIV in children overall, as well as the children with asthma, to prevent influenza -related hospitalization."

The CDC's Advisory Committee on Immunization Practices (ACIP) and the American Academy of Pediatrics (AAP) recommend annual influenza vaccination for all children aged six months to 18 years. The National Asthma Education and Prevention Program (3rd revision) also recommends annual flu vaccination of asthmatic children older than six months.

In order to determine whether the vaccine was effective in reducing the number of hospitalizations that all children, and especially the ones with asthma, faced over eight consecutive flu seasons, the researchers conducted a cohort study of 263 children who were evaluated at the Mayo Clinic in Minnesota from six months to 18 years of age, each of whom had had laboratory-confirmed influenza between 1996 to 2006. The investigators determined who had and had not received the flu vaccine, their asthma status and who did and did not require hospitalization. Records were reviewed for each subject with influenza-related illness for flu vaccination preceding the illness and hospitalization during that illness.

They found that children who had received the flu vaccine had three times the risk of hospitalization, as compared to children who had not received the vaccine. In asthmatic children, there was a significantly higher risk of hospitalization in subjects who received the TIV, as compared to those who did not ($p = 0.006$). But no other measured factors – such as insurance plans or severity of asthma-appeared to affect risk of hospitalization.

"While these findings do raise questions about the efficacy of the vaccine, they do not in fact implicate it as a cause of hospitalizations," said Dr. Joshi. "More studies are needed to assess not only the immunogenicity, but also the efficacy of different influenza vaccines in asthmatic subjects."

No Child Left Unimmunized Against Influenza Act of 2009 - H.R. 2596 (111th):

GovTrack, 21 May 2009
https://www.govtrack.us/congress/bills/111/hr2596/text
https://www.congress.gov/bill/111th-congress/house-bill/2596?s=1&r=320

No Child Left Unimmunized Against Influenza Act of 2009 – Directs the Secretary of Health and Human Services (HHS) to carry out a multistate demonstration program designed to test the feasibility of using the nation's elementary and secondary schools as influenza vaccination centers in coordination with school nurses, school health care programs, local health departments, community health care providers, state insurance agencies, and private insurers.

Prohibits the Secretary from using such program for children who are eligible under other federally funded programs for payment of the costs of purchasing and administering the influenza vaccine. Requires the Secretary to work with the Secretary of Labor, state insurance agencies, and private insurers to ensure that children who have private insurance have coverage for all reasonable and customary expenses, including the costs of purchasing and administering the vaccine, incurred when influenza vaccine is administered outside of the physician's office in a school or other related setting. Authorizes the Secretary to pay the cost of purchasing and administering the influenza vaccine for children to the extent such cost is not covered through other federally funded programs or through private insurance.

Requires the program to be designed to administer vaccines consistent with recommendations of the Advisory Committee on Immunization Practices for the annual vaccination of all children aged 5 years through 19 years.

Sets forth selection criteria for schools. Makes participation by a school or an individual voluntary. Requires the program to be conducted for the 2010-2011 and 2011-2012 influenza seasons.

111TH CONGRESS
1ST SESSION

H. R. 2596

To authorize the Secretary of Health and Human Services to carry out a demonstration program to test the feasibility of using the Nation's elementary and secondary schools as influenza vaccination centers.

IN THE HOUSE OF REPRESENTATIVES

MAY 21, 2009

Mr. GENE GREEN of Texas (for himself and Mr. TIM MURPHY of Pennsylvania) introduced the following bill; which was referred to the Committee on Energy and Commerce, and in addition to the Committee on Education and Labor, for a period to be subsequently determined by the Speaker, in each case for consideration of such provisions as fall within the jurisdiction of the committee concerned

Flu Vaccinated Kids more Likely to be Hospitalized

Lawyers and Settlements, 26 May 2009
https://www.lawyersandsettlements.com/blog/flu-vaccinated-kids-more-likely-to-be-hospitalized.html

On May 19, 2009, researchers presented a study that found children who received the trivalent inactivated influenza vaccine [TIV] had a three times greater risk of hospitalization for the flu than kids who were not vaccinated at the International Conference of the American Thoracic Society in San Diego. => https://www.sciencedaily.com/releases/2009/05/090519172045.htm

To determine whether the vaccine was effective in reducing the number of hospitalizations over consecutive flu seasons for 8 years, the researchers conducted a study of 263 children between the ages of 6 months and 18, evaluated at the Mayo Clinic between 1996 and 2006, with laboratory-confirmed influenza and reviewed records to determine which kids had received a flu shot before the illness and hospitalization.

The CDC currently recommends that "all children aged 6 months up to their 19th birthday get a flu vaccine," on its website.

However, according to the study above, not only did the vaccine not prevent the flu, the kids who received it got sicker than those who did not. Which means that for the 8 year period studied, health insurance companies, government programs and parents were bilked for the cost of useless vaccines, doctors office calls and three times more flu-related hospitalizations, with the children following the expert's advice suffering the most.

The American Academy of Pediatrics, an organization that claims to represent "60,000" pediatricians, also recommends that children be required to receive a flu shot annually, along with a host of other useless and harmful, but highly profitable vaccines throughout childhood.

Last July, CBS News reported that the vaccine industry gives millions to the Academy for conferences, grants, medical education classes and even helped build their headquarters. Totals were secret, but documents cited by CBS revealed the following:

A $342,000 payment from Wyeth, maker of the pneumococcal vaccine – which makes $2 billion a year in sales.

$433,000 from Merck, the same year the academy endorsed Merck's Gardasil HPV vaccine – which made $1.5 billion a year in sales.

Another top donor: Sanofi Aventis, maker of 17 vaccines and a new five-in-one combo shot added to the childhood vaccine schedule in June 2008.

In April 2009, the AAP even went so far as to file an amicus brief (friend of the court) with the US Supreme Court in support of a petition for a writ of certiorari from vaccine makers Wyeth and GlaxoSmithKline to overturn a unanimous ruling by the Georgia Supreme Court that decided a civil lawsuit filed by Marcelo and Carolyn Ferrari on behalf of their autistic son was not barred (preempted) by the National Childhood Vaccine Injury Compensation Act.

The Georgia decision noted that recognizing presumptive preemption would "have the perverse effect of granting complete tort immunity from design defect liability to an entire industry."

The Farrari family alleges that the vaccine makers could and should have manufactured safer childhood vaccines without the mercury-based preservative, thimerosal, that caused their son's autism. The Georgia court's ruling would allow a jury to decide the case.

"The AAP can be counted to be the strongest supporters of the vaccine industry," says Ann Dachel, the mother of an autistic son and the media editor for "Age of Autism."

"And why not?" she points out, "What would a well-baby check be like without the lineup of shots every time a visit is scheduled?"

It should be noted that roughly four million new customers in need of well-baby checks are born every year, according to CDC stats. Some vaccines given to children, such as flu and tenanus, still contain thimerosal.

Other organizations that signed on to the AAP brief to help vaccine makers defeat the lone family include: "American Academy of Family Physicians, AAP Section on Infectious Diseases, American College of Osteopathic Pediatricians, American Medical Association, American Public Health Association, Every Child By Two, Immunization Action Coalition, Infectious Disease Society of America, Pediatric Infectious Disease Society, and the Vaccine Education Center at The Children's Hospital of Philadelphia," according to an April 9, 2009 AAP press release.

Last summer, in addition to listing the vaccine maker funding of the AAP, CBS News reported on pediatrician, Dr Paul Offit, described as "perhaps the most widely-quoted defender of vaccine safety." => https://www.cbsnews.com/news/how-independent-are-vaccine-defenders/

Offit has went so far as to claim babies can tolerate "10,000 vaccines at once." In responding to the CBS report, Offit reportedly told the Orange County Register, "what I actually have said is at least 10,000. It's probably closer to 100,000."

According to CBS, this is how Offit described himself in a previous interview: "I'm the chief of infectious disease at Children's Hospital of Philadelphia and a professor of pediatrics at Penn's medical school." => https://www.cbsnews.com/news/how-independent-are-vaccine-defenders/

But Offit also holds a $1.5 million dollar research chair at Children's Hospital, funded by Merck, CBS found. And he holds the patent on Rotateq, an anti-diarrhea vaccine he developed with Merck.

At the time of the report, future royalties for the vaccine were just sold for $182 million cash. "Dr. Offit's share of vaccine profits? Unknown," CBS New noted on July 25, 2008.

Offit also wrote the book, "Autism's False Prophets: Bad Science, Risky Medicine, and the Search for a Cure." According to a summary on the Amazon site in September 2008:

"In this book, Paul A. Offit, …. challenges the modern-day false prophets who have so egregiously misled the public and exposes the opportunism of the lawyers, journalists, celebrities, and politicians who support them. Offit recounts the history of autism research and the exploitation of this tragic condition by advocates and zealots. He considers the manipulation of science in the popular media and the courtroom, and he explores why society is susceptible to the bad science and risky therapies put forward by many antivaccination activists."

In a February 24, 2009 article in the Huffington Post, Robert F Kennedy, Jr, most appropriately pointed out that: "it's worth recalling that for sixty years the tobacco industry successfully defended a product that was killing one out of every five of its customers against thousands of legal actions brought by its victims and their families."

=> Robert F Kennedy, Jr. Vaccine Court: Autism debate continues. – HuffPost, 27 Mar 2009. https://www.huffpost.com/entry/vaccine-court-autism-deba_b_169673

"Big tobacco prevailed for six decades even without the help of supportive government agencies deliberately suppressing real science and research," Kennedy says. "In that sense vaccine victims must leap a much higher hurdle."

In 1982, American children were given only three vaccines: a live oral polio vaccine; the MMR; and the DPT vaccine, according to the National Vaccine Information Center. By 2007, children were being told by government health officials and pediatricians to get 48 doses of 14 vaccines by age six and 53-56 doses of 15 or 16 vaccines by age 12.

On April 7, 2008, Kalorama Information issued a press release on a market research study and reforecast of the vaccine market titled, "Vaccines 2008: World Market Analysis, Key Players, and Critical Trends in a Fast-Changing Industry," and reported that stronger than anticipated revenues for flu vaccines and the "surprising commercial success" of Merck's Gardasil, had led to $16.3 billion in vaccine sales in 2007, "an increase of 38% over 2006 sales of $11.7 billion."

According to the report, "new products approved in recent years, in particular Gardasil, but also RotaTeq, Pentacel, Zostavax and FluMist, are now having an impact on the market," the release says. "These new products, combined with a continued emphasis on flu vaccines in the U.S. healthcare system, have created a healthy environment for vaccine products."

Kalorama "expects vaccine sales to more than double in five years," the release notes.

H1N1 2009 influenza virus infection during pregnancy in the USA

Lancet, 28 July 2009 // 8 August; 374(9688): 451-8.
doi: 10.1016/S0140-6736(09)61304-0. Epub 2009 Jul 28. PMID: 19643469.

Summary

Background

Pandemic H1N1 2009 influenza virus has been identified as the cause of a widespread outbreak of febrile respiratory infection in the USA and worldwide. We summarised cases of infection with pandemic H1N1 virus in *pregnant women* identified in the USA during the first month of the present outbreak, and deaths associated with this virus during the first 2 months of the outbreak.

Methods

After initial reports of infection in pregnant women, the US Centers for Disease Control and Prevention (CDC) began systematically collecting additional information about cases and deaths in pregnant women in the USA with pandemic H1N1 virus infection as part of enhanced surveillance. A confirmed case was defined as an acute respiratory illness with laboratory-confirmed pandemic H1N1 virus infection by real-time reverse-transcriptase PCR or viral culture; a probable case was defined as a person with an acute febrile respiratory illness who was positive for influenza A, but negative for H1 and H3. We used population estimates derived from the 2007 census data to calculate rates of admission to hospital and illness.

Findings

From April 15 to May 18, 2009, 34 confirmed or probable cases of pandemic H1N1 in pregnant women were reported to CDC from 13 states. 11 (32%) women were admitted to hospital. The estimated rate of admission for pandemic H1N1 influenza virus infection in pregnant women during the first month of the outbreak was higher than it was in the general population (0·32 per 100 000 pregnant women, 95% CI 0·13–0·52 vs 0·076 per 100 000 population at risk, 95% CI 0·07–0·09). Between April 15 and June 16, 2009, six deaths in pregnant women were reported to the CDC; all were in women who had developed pneumonia and subsequent acute respiratory distress syndrome requiring mechanical ventilation.

Interpretation

Pregnant women might be at increased risk for complications from pandemic H1N1 virus infection. These data lend support to the present recommendation to promptly treat *pregnant women* with H1N1 influenza virus infection with anti-influenza drugs.

The Guardian

Sarah Boseley

Give pregnant women priority for swine flu vaccine, study urges

The Guardian, 29 July 2009, 10.06 BST
https://www.theguardian.com/world/2009/jul/29/swine-flu-pregnant-woman-lancet

Article in Lancet says risk of complications is higher, with worrying death rate from virus among expectant mothers in US

Pregnant women should be prioritised for the flu vaccine as soon as it is available, according to the authors of a study showing they are more at risk of complications and more likely to end up in hospital than other people.

Women expecting a baby should also be given antiviral drugs as soon as they get the flu, says the paper published online today by the Lancet medical journal. Little is known about the possible ill-effects of the drugs on the foetus but scientists say their benefits are likely to be greater than the risks.

The research comes from the US, where six pregnant women died of swine flu complications between 15 April and 18 May. In that month, 34 confirmed or probable cases of swine flu were reported to the Centres for Disease Control and Prevention (CDC) from 13 states. Eleven of them were admitted to hospital.

The rate of admission to hospital is four times higher than in the general population, say the authors, Dr Denise Jamieson from the CDC's division of reproductive health in Atlanta and colleagues. That could be because doctors are more nervous about the effects if flu on pregnant women and are more likely to admit them, but the death rate among pregnant women is high.

"Although the decision to admit a pregnant woman is complex and might include considerations beyond simply the severity of disease, that a high proportion (greater than 10%) of influenza-related deaths in the USA have been in pregnant women is concerning," they write.

"In the previous influenza pandemics of 1918 and 1957, mortality seemed to be higher in pregnant women than in non-pregnant populations ... During the pandemic of 1957, 50% of deaths due to Asian influenza in Minnesota among women of reproductive age occurred in pregnant women."

None of the women who died had been given antiviral drugs promptly, within the first 48 hours of symptoms occurring, they write.

Once a vaccine is available, pregnant women will be a high priority, the authors say. However they are concerned that women may not come forward to be vaccinated because of fear of any effect on their baby. Few pregnant women choose to be immunised against winter flu.

Steven Reinberg

Prioritize pregnant women to get Swine Flu shot, experts say
As CDC recommendations loom, new study confirms this group at great risk

U.S. News, 29 July 2009
https://health.usnews.com/health-news/family-health/womens-health/articles/2009/07/29/prioritize-pregnant-women-to-get-swine-flu-shot

Wednesday, July 29 (HealthDay News) – As U.S. officials meet Wednesday to decide who should get priority for potentially scarce H1N1 swine flu shots this fall, the danger the virus poses to pregnant women should vault that group to the top of the list, experts say.

A panel convened by the U.S. Centers for Disease Control and Prevention is expected to release its recommendations on vaccine distribution priorities later on Wednesday. Beyond that, the first trials of a vaccine against the new H1N1 swine flu are set to begin soon, and experts hope for the first batch of viable shots to be distributed by October, if all goes well.

"The panel will get an update on the H1N1 in the United States," said CDC spokesman Tom Skinner. "They will get an update on where things stand with the development of a vaccine against novel H1N1 and an update on the steps being taken to plan for a potential vaccination campaign in the fall."

But a study published in the July 29 issue of *The Lancet* should weigh heavily on the CDC panel's decision. It confirmed that pregnant women are at especially high risk of complications from the new flu strain.

"Pregnant women who have been infected with H1N1 influenza have had a higher rate of hospitalization, about a fourfold increase compared with the general population and a higher proportion than expected of the deaths were among pregnant women," noted study author Dr. Denise J. Jamieson, a CDC medical officer.

Based on those findings, "I would expect that pregnant women will continue to be a high-priority group for vaccination," Jamieson said, so pregnant women who get the H1N1 flu should receive prompt treatment with antiviral medications.

In fact, the first American to die from the H1N1 strain, 33-year-old Judy Trunnell of Texas, fell ill while in late-stage pregnancy. She died May 5 after falling into a coma. Her healthy baby girl was delivered by C-section.

Why does pregnancy put women at special flu risk? Emory University's Dr. Kevin Ault told the *Associated Press* that pregnancy causes changes to women's respiratory and immune systems that may make it more difficult for them to rid themselves of influenza infection. And the World Health organization recently stated that pregnant women may be "at increased risk for severe disease, potentially resulting in spontaneous abortion and/or death, especially during the second and third trimesters of pregnancy."

The risk of H1N1 during pregnancy has even led some health officials in Britain and Switzerland to advise that women consider delaying pregnancy during an H1N1 outbreak. No such call has come from U.S. health officials, however.

There's also the issue of whether a flu shot might confer some protection to newborns, who have relatively undeveloped immune systems. A study published recently in the *New England Journal of Medicine* found just such a transfer of protection among a group of Bangladeshi women and their offspring who received the seasonal flu vaccine.

Dr. Marc Siegel, an associate professor of medicine at New York University Langone Medical Center in New York City, agreed that pregnant woman should be of special concern. "Pregnant women are semi-immunocompromised, they are a target population for any infection," he said. "It is not surprising that they are at risk of flu, any flu."

In addition, today's pregnant women are younger than women born before 1957, who appear to have some immunity to the new H1N1 swine flu, Siegel said. "I put pregnant women up near the top of the list of those who should get the H1N1 vaccine," he said.

Women should not be afraid of being vaccinated against the H1N1 flu, he added. "Any fear of vaccines is greatly outweighed by the benefit of being inoculated against an emerging virus," he said. "The best way to protect a pregnant women is for everyone around her to be vaccinated in addition to her."

Another expert agreed that moms-to-be should be at the head of the line for the H1N1 shot.

"In addition, because of the greatly increased risk of death for pregnant women from either the seasonal flu or from the H1N1 swine flu, those infected with an influenza virus should [also] be promptly treated with appropriate anti-viral agents," said Dr. Pascal James Imperato, dean and distinguished service professor in the School of Public Health at SUNY Downstate Medical Center in New York City.

The seasonal flu vaccine will offer no protection against the H1N1 swine flu, Imperato added. "This means that some groups in the population will need to receive more than just one flu shot in order to be protected against all of the influenza strains in circulation," he said.

There's also the lingering memory of the 1976 swine flu vaccination program, during which some 500 Americans came down with a rare neurodegenerative condition called Guillain-Barre syndrome, which many experts believe was linked to the shot. Twenty-five of those 500 people died.

"The potential for more severe illness and many more deaths caused by this new strain of influenza weighs heavily on our minds -- as does the unfortunate outcome of the 1976 swine flu vaccination program," said CDC spokeswoman Arleen Porcell-Pharr.

But the H1N1 flu vaccine will be very much like seasonal flu vaccines, which have an excellent safety profile, Porcell-Pharr said. "However, no vaccine is 100 percent safe. This vaccine will be no exception," she added.

If the vaccines are recommended for use, those who choose to be inoculated will receive information sheets describing the vaccines' risks and benefits, signs of side effects to look for after vaccination, and information on how to report adverse events, she added.

"We will be watching very closely for any signs that the vaccine is causing unexpected side effects, and we have systems in place to investigate those signals rapidly," Porcell-Pharr said.

U.S.News & WORLD REPORT

Deborah Kotz

Swine Flu Hits Pregnant Women Harder

U.S. News, 29 July 2009, 11:51 a.m.

https://health.usnews.com/health-news/blogs/on-women/2009/07/29/swine-flu-hits-pregnant-women-harder

As a government panel decides today who should be among the first to get the swine flu vaccine, many experts are calling for pregnant women to step to the front of the line. That's because new research shows pregnant women who get swine flu are more likely to develop severe complications that result in hospitalization or even death, according to a study published today in the journal *Lancet*.

Jamieson D, et al. H1N1 2009 influenza virus infection during pregnancy in the USA. – The Lancet, 28 July 2009

"We hope that pregnant women are placed in the high-priority group for vaccinations because our research shows that they're disproportionately represented among the deaths" in this country caused by the H1N1 virus, says study leader Denise Jamieson, an obstetrician-gynecologist in the division of reproductive health at the Centers for Disease Control and Prevention in Atlanta. Of the 45 deaths from swine flu reported in the study, which collected data from April to May, six were pregnant women; that group represented 13 percent of the deaths. That's far higher than expected, since pregnant women make up only 1 percent of the population. What's more, those women who died were young and healthy and had low-risk pregnancies.

Jamieson adds that since the data were collected, there have been 302 swine deaths in the U.S. population, and 15 were pregnant women, representing 6 percent of the deaths. Though that is a lower percentage, the numbers still suggest that pregnant women are more prone to dangerous infections. The exact reasons for the increased susceptibility aren't known, but Jamieson says it could involve the decreased lung capacity that occurs during pregnancy, which makes it easier for the virus to multiply in the lungs. Or it could be because pregnancy weakens certain components of the immune system. (It strengthens others.)

There were certain similarities among the pregnant women who died. They all developed pneumonia and went into acute respiratory distress. None of them were treated with antiviral drugs like Tamiflu within the first 48 hours after they developed symptoms; in fact, by the time they were treated they had been sick for at least six days and as long as 15 days. "All pregnant women who died did not receive antivirals soon enough to benefit their treatment," the CDC said in a prepared statement that accompanied the study. The agency now recommends that pregnant women who have flu symptoms should immediately be treated with the drugs, preferably in the first two days, to lower the severity and duration of the infection.

Jamieson says she'd like to see more diagnostic flu tests performed by OB-GYNs on pregnant women who develop fevers, sore throats, and other possible flu symptoms. "There's limited access to these tests right now, but I do think more emphasis needs to be put on testing pregnant women" to ensure that they're treated promptly and properly, she explains. She also says that doctors need to do a better job of getting pregnant women vaccinated against the flu since seasonal flu is also associated with more severe complications – like heart and lung problems – during pregnancy. Fewer than 15 percent of pregnant women get a regular flu vaccine, even though the CDC started recommending it in 2004.

What about concerns over the mercury preservative thimerosal, which is present in most flu vaccines? (Pregnant women are told to avoid foods high in mercury because of its potentially detrimental effects on a fetus's brain.) "It does seem reasonable that doctors should stock and provide a thimerosal-free vaccine to their pregnant patients," says Jamieson. Such vaccines are currently available for seasonal flu and will also be available for the H1N1 vaccine. Frequent hand washing is another good precaution pregnant women can take, but Jamieson says there's no reason to avoid crowded places or public transportation, as the British government has recommended.

Deborah Kotz

Pregnant Women will be Included in H1N1 Flu Vaccine Trials

U.S. News, 30 July 2009

http://health.usnews.com/blogs/on-women/2009/07/30/pregnant-women-will-be-included-in-h1n1-flu-vaccine-trials.html

As predicted, pregnant women are, indeed, on the government's list of the first folks to be vaccinated against the H1N1 "swine flu" virus. The panel of experts convened by the Centers for Disease Control and Prevention recommended yesterday that the new vaccine be provided first to pregnant women and adults with compromised immune systems, who face a greater risk of complications, and others, like children and health-care workers, who are at higher risk of becoming infected, says Anne Schuchat, director of the CDC's National Center for Immunization and Respiratory Diseases. Some 159 million people fall into these high-priority groups, and whether there will be enough vaccine for all of them when it first becomes available isn't known.

In the event that there are shortages, the panel also came up with a superhigh-priority list of those who should be vaccinated – some 41 million individuals. Once again, pregnant women are on this list. Just how many of them will rush out to get vaccinated, however, remains a mystery. Studies suggest that fewer than 15 percent of expectant moms currently get the seasonal flu vaccine, but more may be willing to get the H1N1 vaccine – and their doctors may push harder for them to have it – given the latest data showing that pregnant women infected with H1N1 are more likely to develop severe complications.

The trouble is, many pregnant women are extremely cautious about getting any shots or medicines because of the potentially harmful effects that these agents could have on a developing fetus. In fact, vaccines that contain live weakened viruses, like measles, aren't administered during pregnancy because of the possibility that they could cause a high fever in the woman – raising the risk of birth defects – or an infection in the fetus. The seasonal flu and H1N1 shots, however, contain dead viruses that don't pose either of these problems. Still, many experts agree, the H1N1 vaccine should be tested in pregnant women before it's licensed for use during pregnancy. (Studies have already established that seasonal flu vaccine is safe and effective to use at any stage of pregnancy.)

The National Institutes of Health is set to begin testing the vaccine in pregnant women in the next month or two. "We're still awaiting word from our institutional review board [which signs off on all clinical trials], so we don't yet know who will be included," says Anthony Fauci, director of the National Institute of Allergy and Infectious Diseases, which is part of NIH. Although he says there's no reason not to include pregnant women at the earliest stage of pregnancy, the review board could "out of an abundance of caution" limit the trials to women who are beyond the first 12 weeks of pregnancy. Unfortunately, he adds, safety and efficacy data won't be available from those pregnant women trials when the vaccine initially becomes available in late October.

One question the trials may address is at what stage during pregnancy the vaccine should be given. Swine flu complications tend to be much worse when women get infected near the end of pregnancy as opposed to during the first 12 weeks. And there's always the possibility – no matter how remote – that something administered during those early weeks when a fetus's organs are still developing could

cause birth defects. "This is a new vaccine, so we can't say whether it's safer to give during one period of pregnancy or another," says Mark Steinhoff, director of the global health center at Cincinnati Children's Hospital, who has researched the use of seasonal flu vaccine in pregnant women.

By and large, there's no reason to think that the H1N1 vaccine will pose any problems for pregnant women since it's being produced in exactly the same fashion as the seasonal flu vaccine. What's more, Steinhoff adds, pregnant women who get vaccinated will probably also confer antibody protection to their newborns who are too young to be vaccinated themselves. This could prove lifesaving if H1N1 infections become extremely widespread or the virus mutates into a deadlier strain.

Pregnant women are also advised to get Tamiflu if they experience symptoms of swine flu like high fever, sore throat, and a cough. But some experts are concerned over the lack of research on the use of this drug in pregnant women infected with H1N1. "We are hugely concerned that we don't know what the right dose is for pregnant women," says Ruth Faden, director of the Berman Institute of Bioethics at Johns Hopkins University. "While it may be that the standard dose of Tamiflu is perfectly appropriate, it's at least possible that it's an insufficient dose for pregnant women at a given stage in pregnancy." That's because pregnant women's kidneys clear drugs faster from the body, which means that certain drugs may not enter the bloodstream at therapeutic levels. (This has been demonstrated with some antibiotics, but Tamiflu hasn't been tested in pregnant women.) "I think the message we should be getting out is that pregnant women should be vaccinated," she says, and that those who get infected and treated with Tamiflu should be studied in clinical trials to see if the drug is given at an effective dose. "This is a tough situation. I wish we weren't in it."

Question a doctor and lose your child

The Sunday Times, 6 September 2009
https://web.archive.org/web/20100106032925/http://www.timesonline.co.uk/tol/life_and_style/health/article6823345.ece

Parents are being threatened with having their children taken into care after questioning doctors' diagnoses or objecting to their medical care.

John Hemming, a Liberal Democrat MP, who campaigns to stop injustices in the family court, said: "Very often care proceedings are used as retaliation by local authorities against 'uppity' people who question the system."

Cases are emerging across the UK:

The mother of a 13-year-old girl who became partly paralysed after being given a cervical cancer vaccination says social workers have told her the child may be removed if she (the mother) continues to link her condition with the vaccination.

A couple had all six of their children removed from their care after they disputed the necessity of an invasive medical test on their eldest daughter. Doctors, who suspected she might have had a blood disease, called for social services to obtain an emergency protection order, although it was subsequently confirmed that she was not suffering from the condition. The parents were still considered unstable, and all their children were taken from them.

A single mother whose teenage son is terminally ill and confined to a wheelchair has been told he is to become the subject of a care order after she complained that her local authority's failure to provide bathroom facilities for him has left her struggling to maintain sanitary standards.

In the first of those cases, Ashleigh Cave, 13, from Liverpool, began experiencing severe headaches and dizziness half an hour after being inoculated last October with Cervarix, which guards against girls contracting the human papilloma virus.

The schoolgirl was soon collapsing repeatedly; she lost the use of her legs and was admitted to Alder Hey children's hospital. Nearly 11 months later she is still in hospital and is unable to stand or walk unaided. Her mother, Cheryl, has now been told that doctors believe her condition must be psychosomatic.

"The hospital brought in social workers from the local authority who have told me they are considering putting Ashleigh on an at-risk register," Cheryl Cave said. She is convinced her daughter's paralysis was caused by the vaccination.

Cave said that a social worker from Sefton council said she suspected her of having Munchausen's syndrome by proxy or factitious illness syndrome – controversial conditions in which mothers are said to attribute illnesses falsely to their children in order to gain attention.

Cave said: "The social worker said I should stop believing the injection has anything to do with Ashleigh's condition because I am putting my thoughts on to her and stopping her getting well.

"Since Ashleigh was in hospital she has become incontinent and had double kidney infections and chest infections. Have I made all these up?"

In the third of these cases, Melvilina Gavin-Langley's 16-year-old son Omar is terminally ill with Duchenne muscular dystrophy and restricted to a wheelchair.

His mother is embroiled in a legal dispute with Birmingham city council over a partly completed extension intended to provide Omar with easy access to a bathroom.

Gavin-Langley, 49, who wants the extension rebuilt because she says it was designed in a way that was dangerous and obstructed access to sewers, said: "I have had to carry Omar upstairs to bathe him but it was risking dislocating his shoulders and also I got a hernia from all the lifting.

"I told the council I could no longer lift Omar across my back.

"They then turned that around and said I had said I could no longer care for my son. They say they have to put him into care because his hair has not been washed and he's not getting a bath. They have just threatened me with this because they don't like me taking legal action against them."

A spokesman for Birmingham city council confirmed the council was seeking an interim care order but said social workers wanted Omar to remain with his mother.

Sefton council did not comment on the Ashleigh Cave case.

THE FLU CASE

Novartis preys on low income children in Germany for "swine flu" jabs

The Flu Case, 8 September 2009, 15:13
https://web.archive.org/web/20090917020700/http://www.theflucase.com/index.php?option=com_content&view=article&id=526%3Anovartis-preys-on-low-income-children-in-germany-to-give-qswine-fluq-jabs&catid=1%3Alatest-news&Itemid=64&lang=en

Novartis is currently testing its "swine flu" jab on 600 children between the age of 3 and 18 years of age recruited around the world reports Michael Mross of MMnews.

The **Tropical Medical Institute of the University of Rostock** in eastern Germany is conducting the tests on 200 children on behalf of Novartis.

The children are receiving 250 Euro for three injections given in a period of three weeks.

Low income families are reported to be enrolling their children for the "swine flu" jabs to generate some extra income.

Michael Mross reports that the doctor in charge of the trials said there was no 100% guarantee the trials would be without side effects.

Novartis is believed to have been the company that caused death to at least 21 people in Poland in the summer of 2008 through its bird flu trials.

THE FLU CASE

Potential for Baxter's and other manufacturers' H1N1 vaccines to cause fertility problems

Report in Chinese on the "swine flu" jab risks

The Flu Case, 9 September 2009

https://web.archive.org/web/20090917131846/http://www.theflucase.com/index.php?option=com_content&view=article&id=535%3Areport-in-chinese-on-the-qswine-fluq-jab-risks&catid=1%3Alatest-news&Itemid=64&lang=en

10) Potential for Baxter's and other manufacturers' H1N1 vaccines to **cause fertility problems**.

Another possible reason for concern about Baxter's H1N1 vaccine is that the company's patent for its general influenza vaccine manufacturing technique states that "Tween 80" (Polysorbate 80) is used in its influenza vaccine production process.

http://en.wikipedia.org/wiki/Polysorbate_80
http://www.theoneclickgroup.co.uk/documents/vaccines/Baxter%20Vaccine%20Patent%20Application.pdf:

Polysorbate 80 is also an ingredients of some squalene-based water-in-oil emulsions used as vaccine adjuvants.

http://docs.google.com/gview?a=v&q=cache:9HVW79vTl14J:www.who.int/vaccine_research/documents/Brief_overview_of_use_of_oil-in-water_emulsions.pdf+squalene+%2B+AS03&hl=en

This is a concern because injection of Polysorbate 80 into baby females rats caused them to develop abnormalities of the reproductive organs. See: =>
https://web.archive.org/web/20080923002041/http://infertility.suite101.com/article.cfm/polysorbate_80_causes_infertility

An excerpt from the above article – a copyrighted work state:

"Gajdova M, Jakubovsky J, Valky J. **Delayed effects of neonatal exposure to Tween 80** on female reproductive organs in rats. Food Chem Toxicol. 1993 Mar;31(3):183-90. PMID: 8473002.

Baby female rats were injected with polysorbate 80 at days 4-7 after birth. It accelerated the maturing of the rats and caused changes to the vagina and womb lining, hormonal changes, ovary deformities and degenerative follicles."

Given the possibility of adverse reproductive effects of Polysorbate 80, it is worrying CDC reccomends that pregnant women and children six months of age upwards and young adults up to the age of 25 be one of the high priority groups (in addition to healthcare and emergency services personnel) of the coming flu vaccine campaign in the USA – if supplies of vaccine are insufficient to vaccinate the whole population at once. Early Results: In Children, 2009 H1N1 Influenza Vaccine works like seasonal Flu Vaccine

NIH News, 21 September 2009
https://web.archive.org/web/20090923181003/www.nih.gov/news/health/sep2009/niaid-21.htm

Early results from a trial testing a 2009 H1N1 influenza vaccine in children look promising, according to the trial sponsor, the National Institute of Allergy and Infectious Diseases (NIAID), part of the National Institutes of Health. Preliminary analysis of blood samples from a small group of trial participants shows that a single 15-microgram dose of a non-adjuvanted 2009 H1N1 influenza vaccine – the same dose that is in the seasonal flu vaccine – generates an immune response that is expected to be protective against 2009 H1N1 influenza virus in the majority of 10- to 17- year-olds eight to 10 days following vaccination. These results are similar to those recently reported in clinical trials of healthy adults. Younger children generally had a less robust early response to the vaccine.

"This is very encouraging news," says NIAID Director Anthony S. Fauci, M.D. "As we had hoped, responses to the 2009 H1N1 influenza vaccine are very similar to what we see with routinely used seasonal influenza vaccines made in the same way. It seems likely that the H1N1 flu vaccine will require just one 15-microgram dose for children 10 to 17 years of age. The 2009 H1N1 influenza virus is causing widespread infections among children, so these are welcome results."

The ongoing NIAID-sponsored trial began in mid-August at five sites nationwide. The trial is assessing the safety and immune responses to one and two doses of either 15 micrograms or 30 micrograms of vaccine. Data from the trial is being compared for three age groups: children 6 months to 35 months old; 3 to 9 years old; and 10 to 17 years old.

The preliminary results are based on blood samples taken eight to 10 days after the first vaccination. Immune responses were strongest among the oldest children, those 10 to 17 years old. In this group of 25 children, a strong immune response was seen in 76 percent who received one 15-microgram dose of vaccine. The immune responses in children nine years old and younger were not as strong. Among 25 volunteers aged 3 to 9 years old, a strong immune response was seen in 36 percent of those given 15 micrograms of vaccine. In the youngest group, 20 children between 6 months to 35 months old, a single 15-microgram dose of vaccine produced a strong immune response in 25 percent of recipients.

"These results are not unexpected and are both similar to what is seen with seasonal influenza vaccines and consistent with what we and our colleagues at the Food and Drug Administration anticipated," notes Dr. Fauci.

Study investigators are also collecting blood samples from the volunteers approximately three weeks after both the first and second injections. It is anticipated that the immune response to the 2009 H1N1 influenza vaccine will be similar to that of seasonal influenza vaccination and will continue to rise for several weeks following vaccination, says Dr. Fauci. The study is being closely monitored by the trial physicians and staff as well as by an independent safety monitoring committee.

The vaccine being tested in this trial is manufactured by Sanofi Pasteur in Swiftwater, Pa., in the same manner as its licensed seasonal vaccine, which is used every year in millions of children, and is the same formulation recently licensed by the FDA to protect against 2009 H1N1 influenza. Like inactivated seasonal influenza vaccines, the vaccine contains a purified part of a killed virus and cannot cause flu.

NIAID is conducting trials of 2009 H1N1 influenza vaccines through its longstanding vaccine clinical trials network, the Vaccine and Treatment Evaluation Units. Additional information about the NIAID-sponsored clinical trials in children is available in an Aug. 18 Bulletin:
http://www3.niaid.nih.gov/news/newsreleases/2009/H1N1pedvax.htm and a Q&A;:
http://www3.niaid.nih.gov/news/QA/qaH1N1pedvax.htm.
A detailed description of the trial protocol is at clinicaltrials.gov:
http://clinicaltrials.gov/show/NCT00944073.

Govt: 1 swine flu shot enough for older kids

The Seattle Times / Associated Press, 21 September 2009, 1:55 pm
https://www.seattletimes.com/seattle-news/health/govt-1-swine-flu-shot-enough-for-older-kids/

Studies of the new swine flu vaccine show children 10 and older will need just one shot for protection – but younger kids almost certainly will need two.

Protection kicks in for older children within eight to 10 days of the shot, just like it does for adults, the National Institutes of Health announced Monday.

But younger children aren't having nearly as robust an immune reaction to the swine flu vaccine, and it appears they'll need two shots 21 days apart, said Dr. Anthony Fauci, head of NIH's National Institute of Allergy and Infectious Disease.

That's not a surprise, since the very young often need two doses of vaccine against regular winter flu the very first time they're immunized against that version of influenza, too, Fauci stressed.

"This is acting strikingly similar to seasonal flu" vaccine, Fauci said. "Overall, this is very good news for the vaccination program."

It means that most people in the U.S. will have to line up for influenza vaccinations twice this year instead of three times – once for the regular winter flu shot and a second time to be inoculated against swine flu, what doctors call the 2009 H1N1 strain.

But here's a twist: If a very young child happens to be getting their first-ever seasonal flu vaccination this year, that tot would need a total of four shots – two against regular flu and two against swine flu.

Once swine flu shots start arriving next month, it will be OK for kids – or people of any age – to get one in each arm on the same visit, said Dr. Anne Schuchat of the Centers for Disease Control and Prevention. But doctors already have supplies of regular flu vaccine, and the CDC wants people to go ahead and get that first inoculation out of the way now.

"This is going to be a complicated flu season," Schuchat warned.

Also Monday, the U.S. ordered more swine flu vaccine, bringing its eventual total to 251 million doses, up from the long-planned 195 million doses. That's an ambitious undertaking for a country where fewer than 100 million people normally get a winter flu shot. The extra orders were from Sanofi Pasteur's Pennsylvania flu-shot factory and from Maryland-based MedImmune LLC, which makes a nasal-spray version.

The new swine flu seems no more deadly than regular winter flu, which every year kills 36,000 Americans and hospitalizes 200,000. But there's an important difference: This H1N1 strain sickens younger people more frequently than the over-65 population who are seasonal flu's main victims. So children are among the priority groups who are supposed to be first in line once swine flu vaccine starts arriving next month, and many schools around the country are expected to offer mass vaccinations.

To determine the right child dose, the NIH set up studies involving 600 children, from babies to teenagers.

About 76 percent of 10- to 17-year-olds showed strong protection after one H1N1 shot. That’s similar to the protection seen with regular winter flu vaccine. It doesn’t mean the rest didn’t respond at all, just that they didn’t have as strong a response, officials cautioned.

But just over a third of 3- to 9-year-olds showed strong protection from the swine flu shot, and only a quarter of babies and toddlers ages 6 months to 3 years, Fauci said.

That response was measured eight to 10 days after the shot, and flu protection usually builds over several weeks so the numbers could improve somewhat, he said. But he wasn’t optimistic that the under-10 crowd would be able to skip the booster dose. Doubling the dose in the shot from a standard 15 micrograms of antigen to 30 micrograms didn’t improve the response.

Younger children simply "don’t have as mature an immune system,” Fauci explained. So a first dose of vaccine against a flu strain they’ve never experienced acts as an introduction for their immune system, and a booster shortly thereafter revs up that immune response.

Side effects are no different from those with regular flu vaccine, such as redness and soreness at the injection site and occasional low fever or headache.

Monday’s study didn’t examine FluMist, the nasal-spray flu vaccine. The first 3.4 million doses of swine flu vaccine to be shipped early next month will be the FluMist version, which can be used by healthy people ages 2 to 49. But health officials said they expected young children to need two doses of FluMist as well.

STATE OF WASHINGTON

DEPARTMENT OF HEALTH

PO Box 47890 • Olympia, Washington 98504-7890

DECLARATION OF OUTBREAK AND VACCINE SHORTAGE AND SUSPENSION OF RCW 70.95M.115 LIMITS FOR CERTAIN INFLUENZA A (H1N1) 2009 MONOVALENT VACCINES IN MULTI-DOSE VIAL PRESENTATIONS

WHEREAS RCW 70.95M.115 prohibits vaccinating a person who is known to be pregnant or under three years of age with influenza vaccine that contains more than 1.0 microgram of thimerosal per 0.5 milliliter dose. RCW 70.90M.115(3) authorizes the secretary of the department of health to temporarily suspend those limits if there is an outbreak of vaccine-preventable disease or a shortage of vaccine that complies with the limits.

The H1N1 influenza virus is a new influenza virus first detected in humans in the United States in April 2009. The United States continues to report the largest number of H1N1 cases of any country worldwide. There have been confirmed cases in all states in the United States. Significant illness from H1N1 influenza has continued into the summer across the country. As of September 04, 2009, the Centers for Disease Control and Prevention (CDC) reported 9,079 hospitalized cases and 593 deaths in the United States and its territories. As of September 16, 2009, there have been 171 hospitalized cases and 16 deaths in Washington State. Of the 16 deaths in Washington State, two have been pregnant women. According to the CDC, rates of infection (the number of reported cases per 100,000 population) are highest among people 0 to 24 years old. Rates of hospitalization among children have been highest in children younger than two years of age.

Nationally and within Washington, the spread of the H1N1 influenza virus has continued through the summer. The CDC and the Department of Health anticipate that the incidence of disease and influenza-related hospitalizations and deaths will increase rapidly starting in September 2009. Vaccination is considered the most effective method to stop community outbreaks as well as reduce overall sickness and death

H1N1 vaccine a tough sell to pregnant women

Los Angeles Times, 23 October 2009
https://www.latimes.com/health/la-sci-flu-pregnancy23-2009oct23-story.html#page=1

As the H1N1 influenza vaccine trickles into clinics and pharmacies over the next few weeks, public health officials and doctors desperately hope that pregnant women will be at the front of the line for the shot. Past influenza pandemics have proved that they're at increased risk for severe complications - and they appear to be even more vulnerable to this new flu strain.

On Thursday, a consortium of major medical groups, including the American Medical Assn., the Centers for Disease Control and Prevention, and the American College of Obstetricians and Gynecologists, released a statement pleading with pregnant women to get both the H1N1 and seasonal flu vaccines. => https://web.archive.org/web/20150210195731/http://www.ama-assn.org/assets/h1n1/mm/pregnant-colleague-letter.pdf

But pregnant women have a well-established antipathy toward vaccinations, with only 15% getting the flu vaccine in any given year, compared with 30% of the general population, according to CDC reports. The current shortage of the H1N1 vaccine may further stymie efforts at widespread immunization. Moreover, pregnant women distrust medications in general -- even though flu vaccines could prevent or mitigate infection should they be exposed.

All of these factors indicate doctors' hopes will go unrealized even as rates of flu-related deaths, hospitalizations and preterm births rise.

"We may have to hospitalize more pregnant women than we ever have before," said Dr. Allison Bryant, an assistant professor of obstetrics, gynecology and reproductive health at UC San Francisco, who has studied the current pandemic's effects on pregnant patients.

By Aug. 21, the latest date for which numbers are available, pregnant women accounted for 6% of the 484 confirmed U.S. deaths linked to what's known as swine flu, although they make up only 1% of the population. Two H1N1-related deaths in pregnant women have been reported in Los Angeles County, according to the county Department of Public Health.

As for pregnant women diagnosed with flu, of the 700 cases reported to the CDC, 14% required admission to an intensive care unit -- four times the hospitalization rate of non-pregnant women of similar age. That number is probably an underestimate, CDC officials said, because many cases aren't confirmed by testing.

Further, many pregnant women are teenagers or young adults – among the groups most likely to develop severe cases of influenza.

"These otherwise healthy pregnant women can deteriorate rapidly," said Dr. Denise Jamieson, a medical officer in the CDC's division of reproductive health. "We have seen some cases where pregnant women present in the emergency room, and they are already so sick they are intubated and delivered very quickly."

Flu has long been known as a disaster for pregnant women. Complications and deaths from flu were much higher among pregnant women and newborns in the pandemics of 1918, 1957 and 1968 than among the general population. In the 1918 outbreak, 27% of flu infections in pregnant women were fatal, compared with about 10% of overall flu cases worldwide.

Unlike in previous pandemics, however, pregnant women have two options for protection this year: the H1N1 vaccine - for which they and young children have been given priority - and the antiviral medication Tamiflu.

"We usually say pregnant women should only take medications for which the benefits outweigh the risks," Bryant said. "But we certainly believe that is the case with H1N1."

Flu, in general, causes more complications in pregnancy because a woman's immune system is naturally weakened to prevent her body from rejecting the fetus. That boosts the chances of secondary infections, such as pneumonia.

In past pandemics, pregnant women had a 50% higher chance of developing pneumonia compared with other infected people, and such women were 50% more likely to die. Pneumonia poses a particular threat to pregnant women because they have limited lung capacity, and the H1N1 strain appears to settle deeper in the lungs of young people.

The risk of flu complications is highest for women infected during the third trimester, when lung capacity is most reduced because of pressure from the fetus. Pregnant women with asthma or other chronic health conditions are at especially high risk for complications – as are those who are obese or poor, who are current or former smokers, or who have underlying heart disease.

Flu is not thought to be transmitted to the fetus, but the infection's indirect effects, such as high fever, can increase the risk of neural tube defects.

In past pandemics, flu during pregnancy has increased the rate of preterm birth. It also may increase the occurrence of miscarriages.

In the unusually severe 1918 pandemic, the miscarriage rate was an estimated 26% in women with uncomplicated flu and 52% in those with influenza and pneumonia, according to historical records. The rate of preterm birth was also about 50% in infected pregnant women.

Given the dire picture from the past of pregnancy and flu, public health officials are now in overdrive to prevent deaths and complications. Obstetricians report receiving at least one letter of advice a week from either the CDC or the American College of Obstetricians and Gynecologists. Thursday's letter described doctors' attention to the matter as "critical."

"What I've taken from that information is that this is serious," said Dr. Kathryn Shaw, an obstetrician at White Memorial Medical Center in Boyle Heights. "We're telling patients, the vaccine is not only safe, but you are high on the list of people who should receive it."

Yet a sizable portion of reproductive-age women in Los Angeles are not convinced of the value of any type of vaccine, said Dr. James Moran, chairman of obstetrics and gynecology at Saint John's Health Center in Santa Monica.

"I've already talked to many patients who say, 'Well, I've read stories that the baby will get autism if I get the vaccine,' " he said. "There is no scientific evidence this vaccine has anything to do with autism. . . . They don't realize influenza is an illness they could die from."

Mari Abrams, 34, is 28 weeks pregnant and works in a marketing department at a hospital. She has spent the last few weeks seeking advice from her doctor, friends and family and on the Internet about the vaccine and has gone from reluctant to convinced. "I'm going to be one of the first in line to get the vaccine," said the Porter Ranch woman. "At some point, I have to trust that this has been tested, and they're looking out for our well-being."

It may be harder to persuade pregnant women to take Tamiflu. Until this year, the drug was not recommended for pregnant women because its effects on the fetus are relatively unknown.

Not usually enthusiastic about recommending drugs for pregnant women, the CDC is nonetheless recommending that pregnant women who know they have been exposed to the flu, and those infected with the flu, begin taking Tamiflu as soon as possible. Preliminary studies suggest it's safe, the agency says.

Parents May Underestimate the Risks of H1N1 Flu for Their Children

Cases of 2009 H1N1 influenza (previously called "swine flu") in the United States this year have shown that children appear to be more susceptible to the virus than older adults. As a result, the Centers for Disease Control and Prevention (CDC) identified children as a priority group for H1N1 influenza vaccination. H1N1 flu vaccine is expected to be available beginning in October, and 2 doses are recommended for young children up through age 10 years.

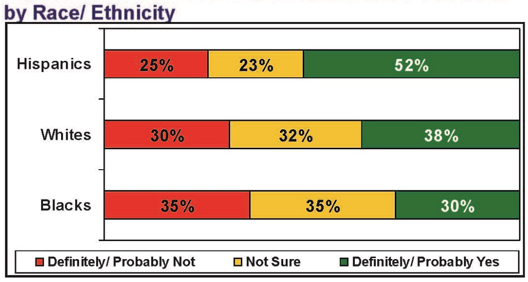
Recognizing the potential severity of H1N1 influenza for children, the C.S. Mott Children's Hospital National Poll on Children's Health surveyed a national sample of parents in August 2009, in order to measure their attitudes regarding H1N1 flu and intentions to vaccinate their children against H1N1 flu.

Plans for H1N1 Vaccination of Children

Despite national recommendations issued in July emphasizing the importance for kids of vaccination against H1N1 flu, only 40% of parents intend to have their children vaccinated. In contrast, more than one-half of parents plan to have their children get seasonal flu vaccine this year (Figure 1).

Figure 1. Parents' Plans to Have Children Get H1N1 and Seasonal Flu Vaccine

Source: C.S. Mott Children's Hospital National Poll on Children's Health, 2009



Parents of children with high-risk medical conditions (for example, asthma) are more likely to plan to have those children get H1N1 flu vaccine.

Report Highlights

- **Only 40% of parents plan to have their children get the H1N1 flu vaccine—much fewer than those who plan to have children get the seasonal flu vaccine.**
- **Hispanic parents are more likely than white or black parents to plan to have their children get the H1N1 flu vaccine.**
- **Nearly one-half of parents who don't plan to vaccinate their children are not worried about their kids getting the H1N1 flu.**
- **Only about one-third of parents believe that H1N1 flu will be worse for children than seasonal flu.**

When comparing racial/ethnic groups, more Hispanic parents plan to have their children get H1N1 influenza vaccine, compared with white or black parents (Figure 2).

Vol. 8 Issue 1 ■ September 24, 2009

Reasons for Parents' H1N1 Vaccine Plans

Parents who report that they definitely or probably will NOT have their children get H1N1 vaccine, or who are unsure, give these reasons:

- 56% Worried about side effects of the H1N1 vaccine
- 46% Not worried about children getting H1N1 flu
- 42% Can take medications to treat H1N1 flu
- 30% Too much hassle to get 2 doses
- 25% H1N1 vaccine won't be required or recommended for school / daycare
- 23% Worried that H1N1 vaccine will be too expensive
- 20% H1N1 is not a serious disease

In contrast, parents who *plan* to have their children get H1N1 vaccine endorse these reasons:

- 83% H1N1 is a serious disease
- 80% Worried about getting H1N1 flu
- 75% H1N1 vaccine is recommended for children
- 62% H1N1 vaccine will likely be required or recommended for school / daycare
- 55% Worried that medications will not be available or effective
- 40% H1N1 vaccine likely to be inexpensive

Parents Estimate the Risk of H1N1 Flu for Children

To measure how parents perceive the risk of H1N1 flu for children, the National Poll on Children's Health asked parents to compare H1N1 flu with seasonal flu.

Across several comparisons, about one-third of parents believe that H1N1 flu will be worse for children than seasonal flu (Table 1). About one-half believe the risks are the same for the two types of flu.

Table 1. How would you compare seasonal flu and the new H1N1 flu for each of the following?

	Seasonal flu will be worse	*Seasonal flu and H1N1 flu will be the same*	*H1N1 flu will be worse*
Number of children who catch it	24%	44%	32%
Number of children who get very sick and need to be hospitalized	14%	48%	38%
Number of missed school days because children are sick	20%	49%	31%

Source: C.S. Mott Children's Hospital National Poll on Children's Health, 2009

Parents' perception of risk is closely tied to their plans to have children vaccinated against H1N1 flu. Parents who think H1N1 flu will be worse for children than seasonal flu are substantially more likely to plan to have their children vaccinated against H1N1.

Implications

When the 2009 H1N1 flu outbreak was first detected in mid-April 2009, CDC began working with states to collect, compile and analyze information about who was affected. That information, analyzed by CDC, supports the conclusion that 2009 H1N1 flu has caused greater disease burden for children than for older people. Unlike what is typically seen with seasonal flu, the rates of illness and hospitalizations related to H1N1 flu are higher for children than for other age groups.

The results from this National Poll on Children's Health indicate that parents may not fully appreciate the different risk of H1N1 flu for their children. In both their intentions to vaccinate children and their comparisons of H1N1 and seasonal flu, many parents do not feel that H1N1 is a significant health threat. Nearly one-half of parents who do not plan to vaccinate their children indicated that they were not worried about their children getting H1N1 disease; nearly 1 in 5 believed that H1N1 flu is not a serious disease.

Another notable finding is the remarkably high proportion of Hispanic parents who plan to vaccinate their children against H1N1 flu. This may reflect a higher perceived risk among Hispanics, given the well publicized outbreak of H1N1 flu in Mexico in early 2009.

With H1N1 flu now becoming more active across the country, it is important that parents seek information about the benefits and risks of H1N1 vaccination for their children, 6 months and older. Public health officials and health care providers must play a critical role in ensuring that parents understand the risks of H1N1 flu illness and H1N1 flu vaccination, and that children have adequate and timely access to vaccine.

Data Source

This report presents findings from a nationally representative household survey conducted exclusively by Knowledge Networks, Inc, for C.S. Mott Children's Hospital via a method used in many published studies. The survey was administered in August 2009 to a randomly selected, stratified group of parents aged 18 and older (n=1,678) from the Knowledge Networks standing panel that closely resembles the U.S. population. The sample was subsequently weighted to reflect population figures from the Census Bureau. The survey completion rate was 62% among panel members contacted to participate. The margin of sampling error is plus or minus 2 to 5 percentage points for the main analysis. For results based on subgroups, the margin of error is higher.

Novartis Vaccines and Diagnostics Limited BLA 1750
September 2009

Influenza A (H1N1) 2009 Monovalent Vaccine

HIGHLIGHTS OF PRESCRIBING INFORMATION
These highlights do not include all the information needed to use Influenza A (H1N1) 2009 Monovalent Vaccine safely and effectively. See full prescribing information.

Influenza A (H1N1) 2009 Monovalent Vaccine
Manufactured by Novartis Vaccines and Diagnostics Ltd.
Suspension for Intramuscular Injection

8.1 Pregnancy
Pregnancy Category C: Animal reproduction studies ***have not been conducted*** with Influenza A (H1N1) 2009 Monovalent Vaccine or FLUVIRIN. It is also not known whether Influenza A (H1N1) 2009 Monovalent Vaccine or FLUVIRIN can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Influenza A (H1N1) 2009 Monovalent Vaccine should be given to a pregnant woman only if clearly needed.

8.3 Nursing Mothers
It is not known whether FLUVIRIN or Influenza A (H1N1) 2009 Monovalent Vaccine is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Influenza A (H1N1) 2009 Monovalent Vaccine is administered to a nursing woman.

8.4 Pediatric Use
Safety and effectiveness in pediatric subjects below the age of 4 years have ***not been established***. [see ADVERSE REACTIONS (6) and CLINICAL STUDIES (14)]

8.5 Geriatric Use
Since 1997, of the total number of geriatric subjects (n = 397) in clinical studies of FLUVIRIN, 29% of adult subjects were 65 years and over, while 2.1% were 75 years and over.

Antibody responses were lower in the geriatric population than in younger subjects. Adverse events occurred less frequently in geriatric subjects (≥65 years) than in younger adults. Other reported clinical experience has not identified differences in responses between the elderly and younger patients. [See ADVERSE REACTION (6) and CLINICAL STUDIES (14)].

8 USE IN SPECIFIC POPULATIONS

Novartis' Influenza A (H1N1) 2009 Monovalent Vaccine and seasonal trivalent Influenza Virus Vaccine (FLUVIRIN) are manufactured by the same process. Available information for FLUVIRIN is provided in this section.

8.1 Pregnancy

Pregnancy Category C: Animal reproduction studies have not been conducted with Influenza A (H1N1) 2009 Monovalent Vaccine or FLUVIRIN. It is also not known whether Influenza A (H1N1) 2009 Monovalent Vaccine or FLUVIRIN can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity. Influenza A (H1N1) 2009 Monovalent Vaccine should be given to a pregnant woman only if clearly needed.

8.3 Nursing Mothers

It is not known whether FLUVIRIN or Influenza A (H1N1) 2009 Monovalent Vaccine is excreted in human milk. Because many drugs are excreted in human milk, caution should be exercised when Influenza A (H1N1) 2009 Monovalent Vaccine is administered to a nursing woman.

8.4 Pediatric Use

Safety and effectiveness in pediatric subjects below the age of 4 years have not been established. [see ADVERSE REACTIONS (6) and CLINICAL STUDIES (14)]

THE FLU CASE

Novartis package inserts admit no data on whether swine flu jab harms pregnant women and children

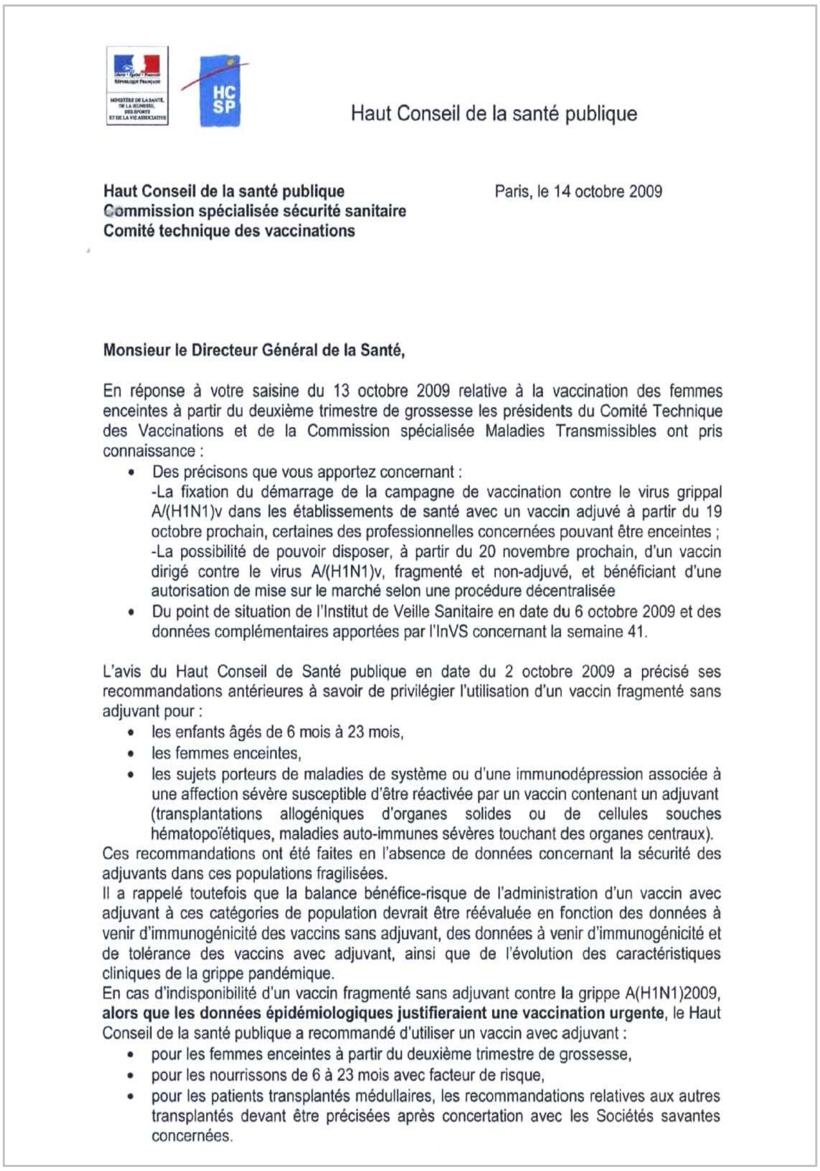
The Flu Case, 17 November 2009, 11:18
https://web.archive.org/web/20100102051527/http://theflucase.com/index.php?option=com_content&view=article&id=1840%3Anovartis-package-inserts-admit-no-data-on-whether-swine-flu-jab-harms-pregnant-women-and-children&catid=1%3Alatest-news&Itemid=64&lang=en

Package inserts for Novartis's swine flu jab (below) show that the companies knows very well there is no clinical data on whether "Influenza A (H1N1) 2009 Monovalent Vaccine or FLUVIRIN can cause fetal harm when administered to a pregnant woman or can affect reproduction capacity."

It is not clear why no clinical trials have been carried out on pregnant women to establish this data since they are a target group and have been for months.

One possibility is that Novartis knows that any clinical trials will reveal that the swine flu jab does cause especial harm to pregnant women and children.

By not conducting the trials, Novartis can imply they are safe when there is no such safety data.



Ministère de la Santé et des Sports
Grippe A(H1N1) - la meilleure protection, c'est la vaccination.
Les gestes de chacun font la santé de tous.

Haut Conseil de la santé publique
Commission spécialisée sécurité sanitaire - Comité technique des vaccinations

Paris, le 14 octobre 2009
https://web.archive.org/web/20091026143900/http://www.sante-sports.gouv.fr/IMG//pdf/Ltre_DGS_reponse_saisine_091013-def.pdf

L'avis du Haut Conseil de Santé publique en date du 2 octobre 2009 a précisé ses recommandations antérieures à savoir *de privilégier l'utilisation d'un vaccin fragmenté sans adjuvant pour*:
• les enfants âgés de 6 mois à 23 mois,
• les femmes enceintes,
• les sujets porteurs de maladies de système ou d'une immunodépression associée à une affection sévère susceptible d'être réactivée par un vaccin contenant un adjuvant (transplantations allogéniques d'organes solides ou de cellules souches hématopoïétiques, maladies auto-immunes sévères touchant des organes centraux).

Ces recommandations ont été faites en l'absence de données concernant la sécurité des adjuvants dans ces populations fragilisées.

Haut Conseil de la santé publique

Haut Conseil de la santé publique
Commission spécialisée sécurité sanitaire
Comité technique des vaccinations

Paris, le 14 octobre 2009

Monsieur le Directeur Général de la Santé,

En réponse à votre saisine du 13 octobre 2009 relative à la vaccination des femmes enceintes à partir du deuxième trimestre de grossesse les présidents du Comité Technique des Vaccinations et de la Commission spécialisée Maladies Transmissibles ont pris connaissance :

- Des précisons que vous apportez concernant :
  -La fixation du démarrage de la campagne de vaccination contre le virus grippal A/(H1N1)v dans les établissements de santé avec un vaccin adjuvé à partir du 19 octobre prochain, certaines des professionnelles concernées pouvant être enceintes ;
  -La possibilité de pouvoir disposer, à partir du 20 novembre prochain, d'un vaccin dirigé contre le virus A/(H1N1)v, fragmenté et non-adjuvé, et bénéficiant d'une autorisation de mise sur le marché selon une procédure décentralisée
- Du point de situation de l'Institut de Veille Sanitaire en date du 6 octobre 2009 et des données complémentaires apportées par l'InVS concernant la semaine 41.

L'avis du Haut Conseil de Santé publique en date du 2 octobre 2009 a précisé ses recommandations antérieures à savoir de privilégier l'utilisation d'un vaccin fragmenté sans adjuvant pour :

- les enfants âgés de 6 mois à 23 mois,
- les femmes enceintes,
- les sujets porteurs de maladies de système ou d'une immunodépression associée à une affection sévère susceptible d'être réactivée par un vaccin contenant un adjuvant (transplantations allogéniques d'organes solides ou de cellules souches hématopoïétiques, maladies auto-immunes sévères touchant des organes centraux).

Ces recommandations ont été faites en l'absence de données concernant la sécurité des adjuvants dans ces populations fragilisées.
Il a rappelé toutefois que la balance bénéfice-risque de l'administration d'un vaccin avec adjuvant à ces catégories de population devrait être réévaluée en fonction des données à venir d'immunogénicité des vaccins sans adjuvant, des données à venir d'immunogénicité et de tolérance des vaccins avec adjuvant, ainsi que de l'évolution des caractéristiques cliniques de la grippe pandémique.
En cas d'indisponibilité d'un vaccin fragmenté sans adjuvant contre la grippe A(H1N1)2009, **alors que les données épidémiologiques justifieraient une vaccination urgente**, le Haut Conseil de la santé publique a recommandé d'utiliser un vaccin avec adjuvant :

- pour les femmes enceintes à partir du deuxième trimestre de grossesse,
- pour les nourrissons de 6 à 23 mois avec facteur de risque,
- pour les patients transplantés médullaires, les recommandations relatives aux autres transplantés devant être précisées après concertation avec les Sociétés savantes concernées.

L'INVS constate actuellement « que l'incidence des consultations pour grippe clinique estimée par le réseau Sentinelles reste stable » bien que toujours au-dessus du seuil épidémique. « La proportion d'infections respiratoires aiguës (IRA) parmi les actes médicaux en médecine de ville est aussi stable selon le réseau des Grog. Les réseaux SOS Médecins et Oscour indiquent une baisse de l'activité grippale pour la deuxième semaine consécutive. Le nombre de cas graves liés au virus A(H1N1)2009 survenu cette semaine reste stable par rapport à celui des semaines précédentes. Le taux de prélèvement positifs pour le virus A(H1N1) 2009 réalisés par le réseau des Grog reste faible ».
Selon cette analyse « le virus A (H1N1) 2009 continue à circuler. Le recours aux soins en médecine de ville pour grippe clinique et infections respiratoires aiguës est stable. La part du virus A(H1N1) 2009 dans ce recours aux soins reste faible. »
La situation en semaine 41 est très proche de celle observée en semaine 40, sans augmentation notable de l'activité de soins liée à la grippe H1N1.
A l'analyse de ces données il apparaît que la situation épidémiologique actuelle ne justifie pas une vaccination urgente. En conformité avec l'avis du 2 octobre 2009, les conditions qui pourraient conduire à l'utilisation d'un vaccin adjuvé chez les femmes enceintes à partir du deuxième trimestre ne sont donc pas réunies. Toutefois, certains cas particuliers liés à des facteurs de risque de complication de la grippe ou à une forte exposition au virus A(H1N1)2009 méritent d'être pris en considération.

Si les conditions épidémiologiques actuelles se maintiennent, la vaccination des femmes enceintes à partir du deuxième trimestre de grossesse pourrait débuter avec la mise à disposition de vaccin fragmenté non adjuvé dûment enregistré par les agences compétentes. Cette position pourra être reconsidérée si l'Institut de Veille Sanitaire enregistrait des signaux indiquant une accélération rapide de la circulation du virus A(H1N1)2009 ou si un retard à la mise à disposition du vaccin fragmenté non adjuvé était annoncé.

Le Comité technique des vaccinations se réunira le jeudi 15 octobre 2009. Outre les précisions sur la vaccination des transplantés et immunodéprimés, il examinera la problématique particulière des femmes enceintes professionnelles de santé et des femmes enceintes avec facteurs de risque. L'avis du Comité technique des vaccinations sera soumis à la validation de la Commission spécialisée Maladies Transmissibles le vendredi 23 octobre 2009.

Nous vous prions de croire, Monsieur le Directeur Général de la santé en l'assurance de notre haute considération,

Professeur Daniel Floret Président du Comité technique des vaccinations	Professeur Christian Perronne Président de la Commission spécialisée Maladies Transmissibles

French government letter generates confusion about whether pregnant women and small children will get adjuvants

The Flu Case, 21 October 2009

https://web.archive.org/web/20091026143900/http://www.theflucase.com/index.php?option=com_content&view=article&id=1266:french-government-letter-generates-confusion-about-whether-pregnant-women-and-small-children-will-get-adjuvants&catid=1:latest-news&Itemid=64&lang=en

The French government body charged with formulating vaccine policy, the Haut Conseil de Sante, changed its recommendation on October 2nd and said that pregnant women and small children should get a "swine flu" jab without adjuvants – but only if there is such a vaccine available. If there is no vaccine without adjuvants available – and French government officals have been claiming this is the case – pregnant women and small children should still get the "jab" with adjuvants, says a letter posted on the French Health Ministry website.

School flu inoculation begins
More than 68,000 kids expected to get shots or nasal mist

Honolulu Adveriser, 14 October 2009
https://web.archive.org/web/20091018090822/http://www.honoluluadvertiser.com/article/20091014/NEWS15/910140325/School+flu+inoculation+begins

Not counting last-minute stragglers bearing late par-ental consent forms, 396 Kalihi Kai Elementary students went under the seasonal flu needle yesterday morning, along with 126 kids who took the vaccine in mist form via nasal spray.

There were few, if any, tears. Kids such as fourth-grader Marc Nunez, 9 – who expressed apprehension about getting his shot beforehand – calmly stroll-ed away afterward saying it didn't hurt much. His secret: "Just look away when they do it," he said.

The occasion was the kickoff of "Protect Hawai'i's Keiki: Stop Flu at School," a program that is expected to inoculate more than 68,000 elementary and middle school students in 334 public, private and charter schools in Hawai'i through Dec. 3.

The school vaccination clinics are being provided by the state Department of Health in collaboration with numerous public and private schools, as well as health care providers and community partner groups.

In the midst of that vaccination effort, the DOH is getting ready to launch a second elementary and middle school program next month to vaccinate students for H1N1, otherwise known as swine flu.

"Other states haven't done something like this," said Gov. Linda Lingle, referring to the fact that two years ago, Hawai'i became the first state to offer free flu vaccine to elementary and middle school students statewide.

"That's why we're so well positioned for the H1NI (swine flu)" vaccination campaign, Lingle said.

The governor was at the school in part to remind students that their parents would soon be receiving another consent form – this one for the H1N1 vaccination program. Lingle encouraged students and parents to read the forms and, if they are comfortable with it, to sign it and mail it back.

Lingle also reminded the students that it's important to be vaccinated for both the seasonal and H1N1 flu strains.

Eventually, she said, the Department of Health and the Hawai'i National Guard would be administering swine flu vaccine to the general public statewide.

"It's not just going to be children, or course," Lingle said. "It will be everybody."

Dr. Sarah Park, state epidemiologist, said the percentage of student participation has increased with each school vaccination clinic program.

"Based on our consent reviews, there definitely seems to be an increased interest among the kids," Park said. "And among the adults as well, actually. Because we also offer vaccinations to the school staff and faculty."

Last year, the total came to 62,000 students and 9,500 staff and teachers.

"I can tell you that in past years we have vaccinated about 43 percent of the kids in Hawai'i ages 5 to 15. And it looks like we will definitely surpass that this year."

Janice Okubo, spokeswoman for the state Department of Health, said one reason the percentage for the free vaccination program isn't higher is because a substantial percentage of parents have their children vaccinated before the beginning of the school year.

"Some parents prefer to take their kids to a private physician," Okubo said. "We would certainly like to break the 50 percent mark, and we're hoping that's going to happen this year."

The student H1N1 vaccination campaign should run through January, Okubo said. The DOH hopes to vaccinate as many students in the swine flu campaign as it will in the seasonal flu program, she said.

Health department nurses will vaccinate middle and high school students during school hours next week

The Tampa Tribune, 19 October 2009

https://web.archive.org/web/20091022134437/http://www2.tbo.com/content/2009/oct/19/hillsborough-schools-start-swine-flu-vaccinations-/#comments

TAMPA - The first swine flu vaccinations in Hillsborough County schools are scheduled for Tuesday and students at exceptional centers are first in line.

It's a day later than organizers originally announced, but officials needed more time, said health department spokesman Steve Huard.

"We wanted to make sure we had enough time for permission slips to go out and be signed, and to make sure we had enough of the vaccine," he said.

Students at Caminiti and LaVoy exceptional centers were scheduled to start receiving the H1N1 vaccine around 8:30 a.m., school officials said. Willis Peters and Eisenhower exceptional centers will follow.

Lopez exceptional center and D.W. Waters and Simmons career centers are scheduled for vaccinations on Wednesday and, if necessary, Thursday.

Next week, beginning Monday, Oct. 26, health department nurses will vaccinate middle and high school students during school hours. Students at charter and virtual schools, and those being home-schooled and enrolled in adult education can also get vaccinated.

Schools scheduled next week include Freedom, Newsome, Steinbrenner and East Bay high schools and Liberty, Randall, Martinez and Eisenhower middle schools.

On Tuesday and Wednesday. Oct. 27 and 28, elementary students accompanied by their parents or guardians can get vaccinated from 3:30 p.m. to 7 p.m. at Leto, Jefferson and Armwood high schools, and at Bowers-Whitley Career Center.

All minor and exceptional education students must have a signed permission slip in order to receive the vaccine. Elementary students must be accompanied by a parent or guardian.

Schools Superintendent MaryEllen Elia and health department Director Doug Holt said last week that vaccination schedules are subject to change depending on availability of the vaccine and demand.

For more information, visit the school district Web site at www.sdhc.k-12.fl.us/ and click on "H1N1 (Swine Flu)."

Boy rushed to hospital after swine flu jab

Belfast Telegraph, 27 October 2009, 16:39
https://www.belfasttelegraph.co.uk/news/health/boy-rushed-to-hospital-after-swine-flu-jab/28500833.html

The safety of Northern Ireland’s swine flu vaccination programme was called into question today by the parent of a young special needs pupil who ended up in hospital just hours after getting the jab.

Anne Marie Fletcher said she feared her 15-year-old son Rhys was going to die as she rushed him to hospital less than 24 hours after receiving the swine flu vaccine.

The teenager fell seriously ill after receiving the injection, along with thousands of other pupils across Northern Ireland last Friday. He was later diagnosed with swine flu.

"My husband drove us to Antrim (Area Hospital) and I sat in the back with Rhys,” she told the Belfast Telegraph. By this stage he was going into spasms. He couldn’t bend his fingers. I was absolutely terrified. He was rambling and becoming incoherent. I honestly thought he was going to die in the back of the car. He kept saying he wanted to sleep but I wouldn’t dare let him close his eyes because I was frightened that if I did he would never wake up.”

The Public Health Agency, the organisation tasked with managing Northern Ireland’s response to the swine flu pandemic, has stated clearly that anyone suffering from flu-like symptoms should remain at home and contact their GP by telephone.

The experience of the Fletcher family from Carrickfergus calls into question whether Government protocols regarding the handling of swine flu are being followed. It is the latest episode to shake public confidence after the family of a Londonderry teenager who died with the virus was not informed she had it until after her funeral.

Some 2,500 children in over 20 special schools for severe learning disability across Northern Ireland were offered the vaccine last week after four pupils died with the virus this month.

The Fletcher family’s ordeal began on Friday, several hours after 15-year-old Rhys received the swine flu vaccine at Hillcroft Special School in Newtownabbey.

"I was concerned about Rhys having the vaccination but after what I heard about the four children with special needs dying after contracting swine flu I thought it was better to be safe than sorry,” Mrs Fletcher said. "I took him into school on Friday and he had his injection. A few hours later he started complaining of having a sore arm. He also had a temperature and he was starting to cough. During the night he started to complain that he felt sick. He was up and down most of the night retching.”

Mrs Fletcher contacted the out-of-hours GP service and was told to bring Rhys to Whiteabbey Hospital. She expressed concerns about bringing him to a hospital in light of his symptoms.

"He was in a lot of discomfort and a lot of pain. He was surrounded by people and they were objecting about him being in the waiting area. When we were eventually seen we were told he had to be referred to Antrim Area Hospital.

"My husband drove us to Antrim and I sat in the back with Rhys. By this stage he was going into spasms. He couldn't bend his fingers, I was absolutely terrified. He was rambling and becoming incoherent. I honestly thought he was going to die in the back of the car. He kept saying he wanted to sleep but I wouldn't dare let him close his eyes because I was frightened that if I did he would never wake up."

Following treatment at Antrim Area Hospital the teenager's condition improved enough for him to be discharged, but several hours after returning home the family received a telephone call from the Public Health Agency.

"They mentioned that Rhys may have swine flu when he was in Antrim Hospital but then they said he didn't have it and he was probably suffering from a reaction from the injection, although they said they couldn't be sure," continued Mrs Fletcher. "We took Rhys home and just before 11pm we got a call from a doctor with the Public Health Agency who wanted to discuss Rhys' symptoms. They phoned again about 11.10pm and asked me to bring Rhys to Dalriada (out of hours GP) to be tested for swine flu, but I told them I wasn't taking him anywhere at that time of night.

"They phoned back later and said there was no urgency and we could bring in the morning, but I refused. I told them I thought people with suspected swine flu shouldn't be taken to hospital and they said it was OK because they could see him in a private room. I was disgusted at this point and said I wouldn't bring Rhys to hospital, so eventually a district nurse came out on Sunday to take some swabs. We got a phone call later on to say he had swine flu."

Mrs Fletcher said she was horrified at the treatment her son has received and that she has serious concerns that countless other people have been exposed to the virus as a result. "Rhys is still very listless and I'm worried he could become badly affected by the swine flu. He is on Tamiflu now but I'm also worried he could suffer side-effects from that as well."

The Department of Health said it could not comment on operational matters, while the Public Health Agency did not provide a response.

A spokesman from the Northern Health Trust said: "We appreciate that this issue was brought to our attention. We cannot discuss individual cases but there is an agreed protocol for dealing with cases such as this. A number of agencies were involved and clearly the protocol was not followed as it should have been. We appreciate the concerns that this will have caused and we will examine the circumstances with our partner organisations to make sure this does not happen again."

Meanwhile, the Health Minister has announced that the swine flu vaccination is to be offered to staff who provide personal care for pupils at special schools here.

The vaccination programme for children with complex special needs was carried out last week.

"The staff who provide personal care to the vulnerable children within special schools for severe learning disability are doing similar work as frontline health and social care workers. Therefore I believe that this move will further protect this vulnerable group of children and young people. I have asked the Public Health Agency to make arrangements to offer vaccine to this group of staff as quickly as possible," Michael McGimpsey said.

Ohio boy given H1N1 Vaccine against mom's wishes

Fox News, Associated Press, 30 October 2009, 10:20 am EDT
https://www.foxnews.com/story/ohio-boy-given-h1n1-vaccine-against-moms-wishes

Oregon, Ohio – A furious Ohio mother says her 7-year-old son, who has had problems with medications, was vaccinated for swine flu at school against her wishes.

Kim Lutheran works as a nurse and says her son, Matthew, has had bad reactions to medicine. So, she says she signed for "no consent" on a vaccination form and then circled her intentions with a black marker to make things clear to the boy's public school in the Toledo suburb of Oregon.

Lutheran says she learned Matthew still received a shot on Monday. She says the local health department must be held accountable.

Deputy Health Commissioner Larry Vasko says his agency has responded by changing the consent forms, telling parents not to sign or return them if they do not want their children vaccinated.

Lutheran told the Toledo Blade that her son was sent back to his classroom after handing in his no consent form, only to sent back to the nurse's office a short time later where he was given the H1N1 Vaccine.

"He got sent back again by himself into strange room with these strange people," she told the newspaper. "Supposedly three people looked at this piece of paper before he went to the R.N. who gave him the immunization. ... He's 7. He didn't know."

Matthew did not have a reaction to the vaccine.

Reports of H1N1 Vaccine Causing Miscarriages

Prevent Disease, 7 November 2009
https://web.archive.org/web/20091112143056/http://preventdisease.com/news/09/110709_H1N1_vaccine_miscarriage_reports.shtml

Krissi Danielsson reporting from About.com quotes an article from the Minneapolis Star Tribune which showed how some pregnant women are skeptical of the new H1N1 vaccine. Several women blogging at the end of the article had experienced miscarriages with the H1N1 vaccine.

Pregnant women are considered one of the "high risk" groups, but many women are less than thrilled about the idea of getting the shot, reporting concerns about the safety of the vaccine and possible effects for the unborn baby.

I can definitely see where they are coming from, being someone who was concerned about safety of pretty much everything when I was pregnant. And there's not much research on the safety of any type of flu vaccine during the first trimester, much less thimerosal exposure in the first trimester, although the CDC says that flu vaccination is advisable in any trimester during a pandemic. As with most cases, all you can really do is weigh the risks and benefits of both courses of action and discuss your concerns with your doctor - then make an informed choice on how to proceed.

What are your thoughts? Do you plan to get the H1N1 flu vaccine, especially if you are currently pregnant or hope to become pregnant in the near future?

Comments (from readers)

October 9, 2009 at 2:41 pm - (1) Jo says: I got the flu vaccine (regular not H1N1) at 8 weeks pregnant. Three days later I miscarried. I am not going to get the H1N1.

October 26, 2009 at 11:07 am - (2) Regrets says: I got both vaccines on Thursday. I was 9 weeks pregnant. I miscarried on Sunday. I was told by several doctors to get these vaccines. Now I wish I followed my gut feeling and not get them at ALL!

October 29, 2009 at 8:33 am- (3) says: i work in a hospital like setting and was told 'the benefits outweigh the risks" 1am i got the vaccine, 3am i started bleeding and craming, 3pm miscarried. you decide

October 31, 2009 at 1:29 pm - (4) sue says: I had the H1N1 vaccination and 24 hours later had a miscarriage.

October 31, 2009 at 8:25 pm - (5) Linda Hill says: My daughter in law was 10 weeks pregnant and had the H1N1 vaccine on Friday that night she miscarried.

November 1, 2009 at 9:58 pm - (6) Stephanie says: I received the H1N1 over a week ago. I am now 5 weeks. I am doing well so far.

November 2, 2009 at 10:52 pm - (7) SoSorry says: I was so ready to get the H1N1 vaccine last week and they were only giving them to pregnant women. I was 6 weeks along and got it and the next day I started cramping and miscarried. I already had two healthy pregnancies and never miscarried or had any problems. My doctors think I am crazy to think it was the H1N1 but if no one looks into this than other women will not know. I am so sorry that I got it.

November 3, 2009 at 4:30 pm - (8) Connie says: I also received the H1N1 vaccination on October 22nd, 2009 and went into labor on October 25th, at 16 weeks pregnant and we just heard the heartbeat and everything was fine with my pregnancy on October 16th, 2009, then on October 28th my water broke then on October 29th, I delivered a stillborn baby boy, and no one can tell me why… Everyone wants to say it did not come from the shot but I believe it did. My baby was growing at the correct pace and everyone wants to brush off the vaccination. I say if you have the vaccination and suffer a miscarriage if they are able to perform an autopsy have it done.

November 3, 2009 at 4:34 pm - (9) Connie says: I also agree something needs to be done and looked more into with this vaccination because most women are being advised it's just something that happens, but I also had two healthy children normal pregnancies and when I received this vaccination with my third pregnancy, my baby is gone. Contact me at connie.adams@rocketmail.com

November 4, 2009 at 10:12 pm - (10) sioux falls, south dakota says: I received the H1N1 vaccine on October 16th and started experiencing cramping on the 22nd. I was nearly 17 weeks pregnant and gave birth to a stillborn baby boy on the 23rd. Like many of the other women here, the first thing I suspected was the H1N1 vaccine.

I immediately asked a nurse at the hospital if that would have anything to do with it. Without hesitation, she told me "absolutely not."

I had reservations about getting the vaccine, but followed the advice of my long trusted family doctor.

In a follow up appointment with my doctor 3 days after I lost my baby, I asked him if the vaccine would have had any adverse effects on my baby. He also said that it was not possible.

I don't believe that my doctor was necessarily lying to me, he was simply following the accepted practices and opinions of his field. I do, however, believe that as a nation, we are being lied to.

This vaccine is NOT safe during pregnancy. There has not been enough testing done to determine this and there are far too many "coincidences" for this to be anything but a result of a vaccine that was hastily pushed into production and distribution in an effort to stop widespread panic.

I have read so many stories in defense of the vaccine that will talk about how common miscarriages are, but I would challenge you to ask ANY health care professional how common second trimester miscarriages are.

My baby was doing perfect developmentally and I had felt him move earlier that day. My heart goes out to all of you out there who have had to go through the same heartache and loss that I have had in the last couple of weeks. There is no reason that any woman or family should have to go through this. Get the word out to all of the pregnant women that you know.

I know that if I had heard that women had been losing their babies shortly after they received the vaccine, I would have followed my gut and not gotten it myself. Maybe then Wyatt would have had a chance at life.

November 5, 2009 at 11:51 am - (11) sue field says: If you read the novatis or baxter pkg insert available on the web you will find that 1. there is not sufficient testing on pregnant women so they dont know how safe it is….its not recommended for children under 2 is not a fetus a child under 2? there is no conclusion on safety with breastfeeding … Md's just want to scare the hell out of you for the 1% that can get very sick... If folks would just wash hands frequently, stay away from sick contacts as much as possible and take supplements and live a healthy way…you likely can avoid the flu altogether… SOOOOO Sorry for your losses … my heart breaks for you all.

The following H1N1 swine flu vaccine miscarriage horror stories are from a June 2010 birth club:

EBWashington: - I am so upset. I was so excited to be pregnant after trying for a year. As soon as I found out I was pregnant, I joined this birth club and I was due June 25th. We have two healthy boys with no history of miscarriage. Everything was going great. Last Monday, I got the H1N1 vaccine thimerosal reduced (mercury reduced for pregnant women). On Tuesday morning, I started cramping and on Wednesday I started bleeding heavily. My hcg was 50 on Wednesday and I was

almost 6 weeks along so it was low. They still thought that I might be pregnant but on Friday my hcg was down to 22. I am an emotional wreck. I feel like I had a healthy baby and I caused this by getting the H1N1 vaccine. My doctors pushed it. I researched online and there have been many miscarriages after the H1N1 vaccine but they haven't been reported since it is hard to say what caused the miscarriages. I hope that I did not cause this. I wish everyone the best.

Tayla08 **-** I don't have an answer for you, but a friend of a friend just had a miscarriage 2-3 days after getting the shot. She was 7weeks. She had no previous history of m/c… No one can answer if they're related…it hasn't been out long enough and there haven't been any studies done on pregnant women. I will tell you, that it has made up my mind on getting it…I won't and I'm not going to get it for my DD either. My daughter and I both had H1N1 last week, and although it truly sucks…I think I'll take my chances. One doctor will tell you to get it and the next will tell you not too…you have to do what's in your heart.

90707 **-** my heart goes out to you as i recently miscarried as well and was due in june. i had a healthy heart beat at 6wks. then at 7.5 wks my son got the h1n1 mist vaccine which has live vaccine in it. the nurse said to be careful b/c it could technically spread if he rubbed his nose and touched a surface etc. the next night i miscarried and 5 days later was diagnosed with h1n1. i work from home, kids are home, hadnt been anywhere during that time. so the chances that it is all related are very high. the flu mist vaccine warns for immunocompromised patients (which includes prego) to stay away from recipients of the flu mist for 21 days.

THE FLU CASE

Swedish boy, aged 4, close to death from "swine flu" vaccine

The Flu Case, 9 November 2009, 12:22
https://web.archive.org/web/20100102020000/http://theflucase.com/index.php?option=com_content&view=article&id=1711%3Aswedish-boy-aged-4-close-to-death-from-qswine-fluq-vaccine&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The almost complete cover up in Sweden regarding deaths and other severe "side effects" from the poisinous Pandemrix "swine flu" vaccine is frightening. A few stories are getting out in spite of this, like the story of Kevin, aged 4 living in Stockholm with his mom Mia who is pregnant in her third trimester.

"- I was sure he was dead" she says in an article published at first only in the printed version of the news paper Aftonbladet and later added to their site after being "reminded" by readers to do so.

Kevin sat with his father in a café when he suddenly started to shake uncontrollably. His little body arched backwards in convulsions and his eyes rolled backwards exposing only white. His mom was not far away and someone quickly fetched her saying "Mia come quickly, Kevin is really bad".

When she arrived to Kevin, a ring of people surrounded him as he was lying flat on the ground. "- His lips were completely white. I have never seen a person that white in my life. I took him in my arms and he was completely limp. My only thought was, 'He is dead, He is no longer alive' ", says his mom.

Kevin did no longer breathe. Two nurses happened to be there and they instructed Mia how to give CPR immediately. Mia started to do that while she at the same time felt she was starting to go into labor. She gave her son air as others called for an ambulance. "I lost the sense of time. But after a while his lips got their color back. He opened his eyes."

During the ride to the hospital, Kevin only expressed one fear: "Mommy, I don't want to have another shot…"

Doctors who cared for him at his arrival at the Hospital agreed that the only explanation to this was that he two days earlier got the poisonous Pandemrix "swine flu" vaccine. They also said "- He is the second one today, this is in no way unique."

The news paper contacted The Medical Products Agency in Sweden and spoke with Professor Jan Liliemark who claimed he had never heard of similar cases. "- Children can come in to states of Coma from a variety of reasons. It could be connected to the vaccination but there could also be other reasons."

Kevin's parents chose to speak about their ordeal so that other parents would be better informed than they were. They never heard that things like this could happen after a vaccination.

Mia says "- What if this would have happened at home while playing alone in his room while I was cleaning downstairs?"

THE FLU CASE

Child paralysed by Flu Mist in the US

The Flu Case, 9 November 2009, 06:59
https://web.archive.org/web/20100102013421/http://theflucase.com/index.php?option=com_content&view=article&id=1706%3Achild-paralysed-by-flu-mist-in-the-us&catid=1%3Alatest-news&Itemid=64&lang=en

"Our granddaughter, Jordyn, (Bobbi and Jeff's daughter) received the nasal spray vaccine for H1N1 on Tuesday of this week and within a half an hour started feeling bad. She developed a fever of 103 and continued for most of Wednesday with it. She seemed better yesterday (Thursday), but was still not herself. She woke up this morning and could not walk (her legs were paralyzed). Bobbi and Jeff have taken her to Sparrow Hospital in Lansing and we are waiting word. We think she has Guillain Barre and, if so, the, paralysis can spread to her other limbs and her face. We are requesting prayer from you and as many believers as you have contact with."

AFTONBLADET

Hälften sjuka efter vaccin

Aftonbladet, 12 November 2009
http://www.aftonbladet.se/nyheter/article6108431.ab

233 elever vaccinerades i måndags. Dagen efter sjukskrev sig 130 elever på en skola i Karlshamn. Många uppgav att de känt sig febriga eller fått värk i kroppen när de hade tagit sprutan, skriver Blekinge Läns Tidning.

Först blev Richard Eitrem, smittskyddsläkare i Blekinge, bestört när han fick höra hur många som blivit sjuka. Han jämförde med när man vaccinerade personalen på infektionskliniken – då blev inte en enda människa sjuk. Men när han hade tagit kontakt med skolans rektor lugnade han ner sig. Alla som sjukskrev sig efter sprutan var tillbaka i skolan dagen därpå.

Enligt Eitrem går det också redan svininfluensa på skolan och därför var sjukskrivningarna fler än vanligt.

Osaklig information

I utsatta förorter till storstäderna vaccineras betydligt färre skolbarn mot svininfluensa än i andra områden. I norra Botkyrka söder om Stockholm och Rosengård i Malmö har bara mellan 20 och 30 procent av föräldrarna sagt ja till att låta vaccinera sin barn. I södra Botkyrka har 70 procent av föräldrarna sagt ja. Det framgår av siffror från skolhälsovården, uppger Ekot.

Enligt Ingrid Scotte, skolsköterska i Rosengård, beror tveksamheten till vaccinet på osaklig information om biverkningar.

THE FLU CASE

Half of school children sick from "swine flu" shot

The Flu Case, 12 November 2009.
https://web.archive.org/web/20100102004722/http://theflucase.com/index.php?option=com_content&view=article&id=1753%3Ahalf-of-school-children-sick-from-qswine-fluq-shot&catid=1%3Alatest-news&Itemid=64&lang=en

In a school in Sweden where the students was mass vaccinated with the poisonous Pandemrix "swine flu", half of them called in sick the day after the vaccination.

Out of 233 students, 130 reported sick the day after the shot and did not show up for school. The doctor administering the shot, Richard Eitrem, was shocked and called the headmaster of the school to find out what the status was of his patients. Many of the students went back to school the second day and this "calmed him down".

The seasonal flu is also making several students ill and according to Aftonbladet, that contributed to the high number of students calling in sick.

The article then states that only 20% to 30 % of the parents in several areas surrounding the capital Stockholm agreed to have their children vaccinated with the poisonous Pandemrix vaccine. According to a school nurse, Ingrid Scotte, that is due to hesitations towards the vaccine based on "irrelevant" information concerning side effects.

Va. teen suffers rare illness after swine flu shot
Boy diagnosed with Guillain-Barre syndrome, but CDC says no clear link

MSNBC, 12 November 2009**,** 12:57 p.m. ET
https://web.archive.org/web/20091115143459/http://www.msnbc.msn.com/id/33845867/ns/health-cold_and_flu

A 14-year-old Virginia boy is weak and struggling to walk after coming down with a reported case of Guillain-Barre syndrome within hours after receiving the H1N1 vaccine for swine flu.

Jordan McFarland, a high school athlete from Alexandria, Va., left Inova Fairfax Hospital for Children Tuesday night in a wheelchair nearly a week after developing severe headaches, muscle spasms and weakness in his legs following a swine flu shot. He will likely need the assistance of a walker for four to six weeks, plus extensive physical therapy. "The doctor said I'll recover fully, but it's going to take some time," the teenager said.

Jordan is among the first people in the nation to report developing the potentially life-threatening muscle disorder after receiving the H1N1 vaccine this fall. His alarming reaction was submitted via msnbc.com's reader reporting tool, First Person, by his stepmother, Arlene Connin.

Jordan McFarland, 14, was hospitalized for five days
after coming down with Guillain-Barre syndrome hours after receiving a vaccination for H1N1
Brendan Smialowski / for msnbc.com

Increased cases of GBS were found in patients who received a 1976 swine flu vaccine, but government health officials say they've seen no rise in the condition associated with the current outbreak.

So far, the federal Centers for Disease Control and Prevention have received five reports of GBS in people who received the H1N1 vaccine since Oct. 6, not including Jordan's case, said Dr. Claudia J. Vellozzi, deputy director for immunization safety.

Out of about 40 million doses of H1N1 vaccine available to date, that's a far lower rate of GBS than the 1 case that develops in every 1 million people who receive the regular flu vaccine. "It's much less than we'd expect," she said, adding that many cases go unreported.

In 1976, about 1 additional case of GBS developed in every 100,000 people who were vaccinated against the swine flu, according to the CDC.

Jordan's parents said doctors diagnosed the teen with GBS, a rare muscle disorder that develops when a person's own immune system attacks the nerves, causing muscle weakness, difficulty walking and sometimes paralysis and death.

Hospital officials didn't dispute that the boy had GBS, but refused to comment on the boy's condition or treatment, even after his family granted permission. "They don't want to create a fear or panic in the community," said Jordan's stepmother, Connin. Connin and Jordan's father, Calvin McFarland, both 38, believe the shot sparked the illness that came on 18 hours after the boy's vaccination.

No clear link

But Vellozzi said there's no clear link between the new vaccine and the disease. "We know that GBS and other illnesses occur routinely in the U.S.," Vellozzi said, noting that 80 to 120 cases are diagnosed each week in the general population. "There are events that follow vaccination. That's what they are, they happened to follow vaccination.

GBS is among the most severe adverse events being tracked with updated systems developed by the CDC, the Food and Drug Administration and the American Academy of Neurology in order to monitor the rollout of the H1N1 flu vaccine.

So far, CDC officials have received about 1,700 reports of adverse events linked to the new shot, Vellozzi said. Of those, only about 4 percent, or 68, were coded as serious. That's on par with reports regarding seasonal vaccine.

While any harmful side effect can be devastating for an individual, when it comes to larger public health issues, the H1N1 virus is considerably riskier than the vaccine, experts say.

"The H1N1 illness is making lots of children very ill," Vellozzi said. "There's lots of illness and lots of death." So far, more than 4,000 people have died from H1N1 infection in the U.S., according to latest estimates by the CDC. Since the start of the H1N1 vaccine campaign, the CDC has repeatedly warned that certain conditions, such as miscarriage, heart attack and even GBS occur regardless of immunization, and officials have urged the public not to blame the vaccine for the illnesses, but to report promptly any suspected side effects.

As of early Wednesday, CDC officials said they had received no report from Inova Fairfax about Jordan's condition. Later in the day, however, hospital spokesman Tony Raker indicated the hospital had submitted the report.

After hearing about Jordan's case from msnbc.com, CDC officials advised the family to report Jordan's case themselves.

Vaccine critic Barbara Lowe Fisher, president of the National Vaccine Information Center in Vienna, Va., said assuming all potential side effects are coincidence is a mistake. Such an attitude is likely to prevent doctors and other health workers from reporting adverse events in a timely manner, obscuring a true picture of any problems.

Mike Adams

Virginia teen athlete in wheel chair after H1N1 vaccine shot

Natural News, 12 November 2010
https://www.naturalnews.com/027473_Guillain-Barre_Syndrome_swine_flu_vaccine.html

A teenage Virginia athlete is in a wheel chair now after suffering Guillain-Barre Syndrome within hours after receiving an H1N1 swine flu vaccine shot. 14-year-old Jordan McFarland developed severe headaches, muscle spasms and weakness in his legs after being injected. He will need "extensive physical therapy" to recovery, reports MSNBC. Plus, he'll need the help of a walker for four to six weeks.

Guillain-Barre Syndrome (GBS) is the name given to anyone who exhibits a particular set of neurological symptoms including muscle weakness and muscle spasms. GBS is now increasingly occurring following H1N1 vaccine injections. It was diagnosed in thousands of patients following the 1976 swine flu vaccine scare, and it appears to be recurring here in 2009 as the swine flu vaccine makes it into more widespread distribution.

Health authorities, however, remain adamant that H1N1 vaccines are *never* the cause of GBS, and that such diagnoses are "pure coincidence." This blatantly unscientific P.R. tactic is designed to dismiss any and all concerns over the neurological side effects of H1N1 vaccines by simply denying they exist. To date, the CDC has received reports of five additional people being diagnosed with GBS following swine flu vaccinations, but it dismisses them all as coincidence. "It's much less than we'd expect," says CDC official Dr. Claudia J. Vellozzi. (Which is sort of interesting all by itself, because it reveals that the CDC expects a lot more people to get GBS following vaccine injections...)

At the same time, part of the reason the CDC isn't receiving many reports on neurological disorders caused by H1N1 vaccines is because they participated in **a massive media brainwashing event** that prepped the population to dismiss all side effects by pre-announcing the bizarre idea that "side effects experienced after vaccine injections are not related to vaccines."

This was an organized, nationwide media brainwashing campaign engineered by the CDC, FDA and drug companies. It sought to pre-program health consumers to automatically dismiss serious side effects that appeared in the hours after receiving swine flu vaccine injections.

The campaign worked. In fact, even the GBS of this young man, Jordan McFarland, wasn't submitted to the CDC. It only came to light when his step-mother submitted details to MSNBC.com's *reader reporting tool*. In other words, this was **citizen journalism** at work, where a parent submitted information directly to the media.

For this to occur is exceedingly rare. Most parents would simply wait for their doctor to submit such information to health authorities, not knowing that submitting reports of vaccine-related side effects *remains voluntary* in modern medicine.

No requirement to report vaccine side effects

You read that right: There is no requirement that doctors send reports of vaccine side effects to any health authority at all. And that raises the question: So how do they really know how many people are suffering neurological side effects from the H1N1 vaccines?

The answer? *They don't.* Nobody knows.

And that's the way the drug companies (and the CDC) would like to keep it. Because reports of neurological disorders tend to (understandably) freak people out and make them more cautious about receiving swine flu vaccines -- especially given how mild swine flu is in the first place. As drug companies well know, the best way to sell more vaccines is to pretend the side effects don't exist at all. That has become the standard operating procedure of the vaccine industry: Deny, deny, deny. Bury the truth and pretend it doesn't exist. Keep the vaccines flowing and keep consumers guessing. Declare all vaccines to be perfectly safe with zero side effects, and widen the target consumer base to include children and pregnant women. This is the mantra of the vaccine industry.

Consider this: If teen boys wound up in the hospital after taking *a dietary supplement*, the FDA and media would have gone crazy over the report. The FDA would have issued public warnings and perhaps even confiscated the products from the supplement manufacturer. Or if these kinds of symptoms were being reported after people take *medicinal herbs*, you'd see a similar media frenzy as accusations of the dangers of the herbs appeared all over the 'net. But somehow when the medicine is *a vaccine* -- a vaccine that has NEVER been tested in a scientific clinical trial -- the drug industry gets a free pass! All side effects are dismissed. All the people hospitalized, paralyzed or killed are simply forgotten and written off as unimportant.

This is the state of the vaccine industry today: It is corrupt, highly dishonest industry that poses a clear and present danger to the health of the People. And yet *absolutely nothing is being done to protect the people from unsafe vaccines*. No clinical trials are being done. No cautions are being advised. All concerns are simply dismissed out of hand, with absolutely no intelligent scrutiny or investigation.

No questions allowed

That's really what the vaccine industry has become today: A cabal of "untouchables." You can't question vaccines without being derided as a quack. You can't demand vaccine clinical trials without being labeled a "non-believer." **Vaccines have become the cult of modern medicine.** You're supposed to simply line up, drink your Kool-Aid take your vaccine shot, obey all directives (do what you're told) and above all *stop asking questions!*

But here at NaturalNews, we refuse to stop asking questions. In fact, **we have more questions** all the time, like why is a healthy young boy suddenly in a wheel chair within hours after receiving a swine flu vaccine shot?

Why have no placebo-controlled clinical trials ever been conducted on ANY flu vaccine?

Why do we even need a shot for H1N1 when the epidemic is so mild that it has only killed a fraction of the number of people who normally die from seasonal flu?

Why did the FDA grant approval for four H1N1 vaccines all on the same day, without any scientific testing at all?

Why are people so easily brainwashed / scared into taking vaccine shots when all they really need is vitamin D?

And for that matter, why does there continue to be a media blackout on the use of vitamin D to prevent swine flu infections?

These are the questions we should be asking, but these are the questions considered "off limits" by health authorities and the complicit mainstream media. At least MSNBC had the guts to print this story about 14-year-old Jordan McFarland. Most media outlets would have simply canned the story right from the start.

Huliq News

Cheryl Phillips

Teen Suffers from Guillain-Barre Syndrome after H1N1 Swine Flu Shot

Huliq News, 12 November 2009.
https://web.archive.org/web/20091115044553/http://www.huliq.com/8059/88700/teen-suffers-guillain-barre-syndrome-after-h1n1-swine-flu-shot

A 14-year-old Virginia boy was hospitalized for five days after coming down with Guillain-Barre syndrome hours after receiving a H1N1 swine flu vaccination. Guillain–Barré is one of the leading causes of non-trauma-induced paralysis in the world.

Jordan McFarland, a high school athlete from Alexandria, Virginia is one of the first people in the nation to report developing the potentially life-threatening muscle disorder after receiving the H1N1 vaccine this fall.

Jordan spent 5 days in Inova Fairfax Hospital for Children after suffering an almost immediate reaction to the H1N1 flu vaccine. He became weak and struggled to walk after coming down with a reported case of Guillain-Barre syndrome (GBS) within hours after receiving the H1N1 vaccine for swine flu.

Guillain–Barré syndrome is an autoimmune disorder affecting the peripheral nervous system, usually triggered by an acute infectious process. GBS is rare and has an incidence of 1 or 2 people per 100,000.

It is frequently severe and usually exhibits as an ascending paralysis noted by weakness in the legs that spreads to the upper limbs and the face along with complete loss of deep tendon reflexes.

With prompt treatment, the majority of patients will regain full functional capacity. However, death may occur if severe pulmonary complications and autonomic nervous system problems are present.

Jordan McFarland left the hospital Tuesday night in a wheelchair nearly a week after developing severe headaches, muscle spasms and weakness in his legs following an H1N1 swine flu shot.

GBS may be a rare side-effect of influenza vaccines, with an incidence of about one case per million vaccinations. There were reports of GBS affecting about 500 people who had received swine flu immunizations in the 1976 U.S. outbreak of swine flu.

Twenty-five of these people died from severe pulmonary complications, leading the government to end that immunization campaign. There is some speculation that GBS may not have been directly due to the vaccine but to a bacterial contamination of the vaccine.

To date, the federal Centers for Disease Control and Prevention have received five reports of GBS in people who received the H1N1 vaccine since October 6, 2009. This does not include Jordan's case, according to Dr. Claudia J. Vellozzi, deputy director for immunization safety.

Connin and Jordan's father, Calvin McFarland, both 38, believe the shot caused the illness that came on 18 hours after the boy's vaccination. His doctors have confirmed that Jordan has GBS, but do not want to talk about the case as it may create panic among people who have still not received their H1N1 Swine flu shot.

So far, CDC officials have received about 1,700 reports of adverse events linked to the new shot. Of those, only about 4 percent, or 68, were coded as serious.

While any harmful side effect can be devastating for an individual, when it comes to larger public health issues, the CDC stresses that the H1N1 virus is considerably riskier than the vaccine.

People like Jordan McFarland, who was diagnosed with GBS after an H1N1 vaccine, can typically expect recovery to start after the fourth week from the onset of the disorder. Approximately 80% of patients have a complete recovery within a few months to a year, although minor findings may persist, such as the absence of neurologic reflexes.

If you or your child have ad adverse reaction to an H1N1 swine flu vaccine, report the incident here on the Vaccine Adverse Event Reporting System: http://vaers.hhs.gov/index

DIGITAL JOURNAL

Teenager suffers Guillain-Barre syndrome after swine flu shot

Digital Journal, 12 November 2009
https://web.archive.org/web/20091115100348/http://www.digitaljournal.com/article/282042

During the 1970s flu scare, when a strain of the Swine Flu circulated in the United States, hundreds of people contracted Guillain-Barre syndrome after being vaccinated. A new case in Virginia has some worried history will repeat itself.

After receiving the H1N1 Swine Flu vaccine, a 14-year-old Virginia boy is having a hard time walking. On Tuesday night he finally left the Fairfax Hospital for Children after a week of muscle spasms and weakness in his legs, according to *Huliq News*.

Jordan McFarland has been diagnosed with Guillain-Barre syndrome and will spend some time in a wheelchair.

In 1976, when a strain of the Swine Flu spread across the U.S., there were 500 reported cases of Guillain-Barre syndrome and 25 deaths. Today, 33 years later, some analysts worry about more people will get Guillain-Barre syndrome.

As *MSNBC* notes, the Center for Disease Control and Prevention have received five reports of people contracting GBS since Oct. 6, not including McFarland's case. Deputy Director for Immunization Safety, Dr. Claudia J. Vellozi, said the rate is only one out of about 40 million doses, which is far lower than the regular flu shot.

Vellozi further added, "We know that GBS and other illnesses occur routinely in the U.S. There are events that follow vaccination. That's what they are, they happened to follow vaccination."

GBS is rare, with one out of every 100,000 people being diagnosed with the non-trauma-induced paralysis. After in-depth and serious treatment, 80 per cent of patients have fully recovered and it is expected that McFarland will completely recover.

However, some analysts and doctors, such as Vellozi, believe the diagnosis may not be from the vaccine but a bacterial contaminant in the H1N1 vaccine. Vellozi added that there are 80 to 120 GBS cases reported each week in the US.

In addition, as *Natural News* reports, American doctors are not required to report vaccine side-effects to any health authority.

In July, *Digital Journal* reported that public health officials were calling for a no-fault compensation that would encourage people to take the vaccination because it may cause conditions or side-effects similar to McFarland's case.

The H1N1 Swine Flu vaccine has not received the standard testing usually applied to vaccines by the World Health Organization.

Nevertheless, the high school athlete remains optimistic, "The doctor said I'll recover fully, but it's going to take some time."

Tvååring dog trots H1N1-vaccinering

HBL, 13 November 2009, 10:13
https://web.archive.org/web/20091220095857/http://www.hbl.fi/text/helsingfors/2009/11/13/w39771.php

Ett två år gammalt barn dog i svininfluensan i går. Barnet hörde till riskgruppen och hade vaccinerats en vecka tidigare.

Enligt pressmeddelandet från sjukvårdsdistriktet HNS blev barnet sjukt i början av veckan. I onsdags togs barnet in för sjukhusvård. Det hade då gått en vecka sedan barnet vaccinerats mot H1N1.

Barnet vårdades på akuten vid Barnkliniken på Mejlans sjukhusområde där det sedan avled en dag senare.
Den exakta dödsorsaken är inte känd.

THE FLU CASE

Child dies one week after getting the flu shot – cause of death claimed to be "swine flu"!

The Flu Case, 17 November 2009.
https://web.archive.org/web/20100102011044/http://theflucase.com/index.php?option=com_content&view=article&id=1846%3Achild-dies-one-week-after-getting-the-flu-shot-cause-of-death-stated-to-be-qswine-fluq&catid=1%3Alatest-news&Itemid=64&lang=en

In Finland is reported that a child at the age of two died from the "swine flu". In the article it says that the child received the "swine flu" vaccine shot one week earlier and in a bizarre twist of facts, it states the child died from the "swine flu" not the vaccine. In the same article, at the very end a disclaimer: "The exact cause of death is not known".

This is what we see now around the world - cases of death being proclaimed to be a result of the "swine flu" and not the vaccination which they received a few days before death.

THE FLU CASE

Child of two and woman of 18 die after getting swine flu shot in Finland

The Flu Case, 13 November 2009, 16:52

https://web.archive.org/web/20100102040548/http://theflucase.com/index.php?option=com_content&view=article&id=1772%3Achild-of-two-and-woman-of-18-die-after-getting-swine-flu-shot-in-finland&catid=41%3Ahighlighted-news&Itemid=105&lang=en

At least two people have died in Finland after getting the swine flu jab. A two-year-old child died one week after getting the shot. According to the local media, the shot "came too late and couldn't save the child."

In addition, an 18-year-woman died in the Päijät-Häme Hospital District in Lahti one week after getting the jab, according to the newspaper Helsingin Sanomat, which, however, attributes the death to the swine flu virus and not the vaccine.

In an interview with Helsingin Sanomat President Tarja Halonen said that she has not been vaccinated yet, as she does not belong to any of the risk groups, and does not plan to jump the queue.

However, the Speaker of Parliament Sauli Niinistö said the President and the government ministers should be allowed to jump the queue to get their H1N1 shots.

...

The Päijät-Häme Hospital District confirmed on Wednesday that an 18-year-old woman had died as a result of a H1N1 virus infection. She had a difficult long-term illness.

She had been admitted to the Päijät Häme Central Hospital in Lahti early on Tuesday morning. The woman had exhibited swine flu symptoms for several days, and was tested positive for the H1N1 virus.

After being treated with antibiotics and antiviral medicines, the woman was transferred to a life support machine. She died at the hospital on Tuesday night.

According to the hospital district, the patient had been vaccinated last week, but it did not manage to boost her immunity against the virus immediately.

The vaccine will offer protection against the H1N1 influenza infection in two to three weeks from the vaccination.

According to THL it is not possible to contract the swine flu from the vaccine.

The current number of H1N1-related deaths in Finland is six.

However, the number of infected individuals is tens of thousands, maybe more than 100,000. Some people get only a very mild infection, occasionally even without any symptoms.

Gripe A: mãe recebe vacina e feto more

Raiva Escondida, 15 Novembro 2009
https://raivaescondida.wordpress.com/tag/swine-flu/

Hospital de Portalegre diz que não há relação entre os dois factos

Uma mulher grávida de 34 semanas foi vacinada com a vacina contra a gripe A e o feto de oito meses acabou por morrer três dias depois, confirmou o tvi24.pt junto de fonte do Hospital de Portalegre.

A mesma fonte adiantou que até ao momento não está provada qualquer relação entre os dois factos. Em comunicado, o hospital esclarece que o nascimento do bebé já morto ocorreu este domingo e que a grávida dirigiu-se ao hospital no sábado «por diminuição dos movimentos fetais».

João Romacho, cunhado da mulher de 31 anos, natural de Alegrete, Portalegre, disse em declarações à Lusa, que depois de na quarta-feira ter sido vacinada contra a gripe A, a grávida começou a queixar-se de dores no corpo e mal-estar geral, estranhando que o bebé ora se mexesse mais do que o normal, ora não se mexesse.

«No sábado de manhã [a grávida] foi ao Centro de Saúde de Portalegre, onde a médica que a assistiu verificou que o batimento cardíaco do feto era baixo, mas existia, e aconselhou-a a ir para casa e a voltar no dia seguinte para ver como estava», disse João Romacho à Lusa.

A mulher acabaria por recorrer ao Hospital de Portalegre por volta do meio-dia de sábado, onde ficou a saber que o coração do feto tinha parado.

João Romacho disse à Lusa que os médicos afastaram desde logo a hipótese de a morte do feto estar relacionada com a vacina, mas os familiares da mulher desconfiam que possa haver uma ligação.

«Não podemos dizer que tenha sido da vacina até porque anteriormente já tinha havido um episódio em que o batimento cardíaco do bebé estava muito acelerado, mas claro que depois de ter tomado a vacina… deixa-nos intrigados e com interrogações. A realidade é que a partir daí [da vacinação] se desenvolveram uma série de reacções», disse o familiar.

O hospital confirma, no comunicado, que a mãe foi vacinada contra o vírus H1N1 na passada terça-feira, mas adianta que não é possível estabelecer uma relação causal entre a vacinação da grávida e da morte do feto».

A direcção hospital acrescenta também no comunicado que «a ocorrência de nados-mortos em Portugal, sem causa prévia, é em média de um por dia».

João Romacho adiantou ainda que os familiares aguardam agora pelos resultados da autópsia ao feto e reclamam explicações dos médicos que acompanharam a mulher ao longo da gravidez para apurar se houve responsabilidades. Só a autópsia, efectuada pelo Instituto de Medicina Legal, poderá revelar a causa de morte do bebé e se a morte estava ou não relacionada com a vacina contra o vírus H1N1.

Gripe A: Terceiro feto morto em grávida vacinada. – Raiva Escondida, 18 Novembro 2009. https://raivaescondida.wordpress.com/tag/swine-flu/

Deu ontem entrada no Hospital de Santo André, em Leiria, mais uma grávida com um feto morto e que tinha sido vacina contra a gripe A (H1N1). É o terceiro caso em poucos dias, mas as autoridades não confirmaram até agora nenhuma relação causa-efeito entre a morte dos fetos e a inoculação.

A jovem de 27 anos estava grávida de vinte semanas e tinha sido vacinada no início do mês. Deu ontem entrada no Hospital de Santo André, em Leiria, que confirmou a morte do feto, que será autopsiado.

Ontem foi confirmada, no hospital CUF Descobertas, a morte de um feto de 34 semanas, cinco dias depois de a mãe ter sido vacinada contra a gripe A. A situação surgiu dois dias depois de uma outra mulher, vacinada

em Portalegre, ter perdido a filha que esperava há também 34 semanas. A Direcção-Geral da Saúde recusa comentar o caso até serem conhecidos os resultados de análises e testes que só podem ser feitos depois do nascimento.

O director clínico do Hospital CUF Descobertas garantiu hoje que vai ser feita autópsia ao feto que morreu com 34 semanas. A autópsia poderá ser fundamental para encontrar a causa da morte, mas os médicos recusam estabelecer uma ligação entre a morte do bebé e a vacina para a gripe A.

João Saramago
Gripe A: Quarta grávida vacinada perde bebé. – Raiva Escondida, 23 Novembro 2009
https://raivaescondida.wordpress.com/tag/swine-flu/

Em Portalegre:
Morreu mais um feto no Hospital de Portalegre em que a grávida foi vacinada contra a gripe A.

A grávida residente em Ponte de Sôr deu entrada, nas últimas 24 horas, nesta unidade hospitalar, onde a 15 de Novembro morreu um outro feto com 34 semanas em que a mãe também foi vacinada.

O pai da grávida, Romão Catarino, confirmou o caso referindo que uma das possíveis causas poderá ter resultado do enrolamento do cordão umbilical à volta do pescoço do feto.

O Hospital de Portalegre promete, para o final da tarde, esclarecimentos sobre este caso, divulga a ‘Rádio Portalegre’.

No espaço de oito dias, sobe para quatro o número de grávidas vacinadas com a ‘Pandemrix’ que perderam os bebés. Além dos dois casos de Portalegre, ocorreu um em Lisboa e um outro em Leira.

Na Europa são conhecidos pelo menos mais três casos com grávidas que tomaram a vacina e perderam os bebés. Dois na Noruega e um em França.

THE FLU CASE

Another woman loses her baby after Pandemrix jab in Portugal

The Flu Case, 25 November 2009, 07:02
https://web.archive.org/web/20100102015908/http://theflucase.com/index.php?option=com_content&view=article&id=2052%3Aanother-woman-loses-her-baby-after-pandemrix-jab-in-portugal&catid=1%3Alatest-news&Itemid=64&lang=en

Another woman who vaccinated with the Pandemrix swine flu jab in Portugal has lost her baby.

The woman from Ponte de Sor lost her baby in the 34th week at the Hospital de Portalegre after getting the jab.

In the space of eight days, at least four women vaccinated with the 'Pandemrix' in Portual have lost babies, two in Portalegre, one in Lisbon and another in Leira.

Gripe A: morre mais um feto depois da vacina

tvi24, 17 Nov 2009, 20h 57
https://tvi.iol.pt/noticias/sociedade/h1n1/gripe-a-morre-mais-um-feto-depois-da-vacina

Grávida está internada no hospital CUF Descobertas, em Lisboa

Uma grávida deu entrada no hospital CUF Descobertas esta segunda-feira à noite com o feto já sem vida, confirmou fonte do gabinete de comunicação do grupo José de Mello Saúde ao tvi24.pt.
«Podemos confirmar que deu entrada esta segunda-feira à noite no hospital CUF Descobertas uma grávida de 34 semanas cujo feto estava sem vida», disse a fonte.
A mesma fonte garantiu que a grávida tinha sido vacinada contra a gripe A na passada sexta-feira, sendo que o feto ainda não saiu. Não foi revelada a idade da mulher.

O tvi24.pt sabe que a grávida continua internada no mesmo hospital, sendo que o parto do feto morto ainda não foi efectuado, e que a mulher foi vacinada na sexta-feira passada. «Não parece haver nenhuma relação causa-efeito entre a vacina e a morte do feto. Mas só depois do parto e da autópsia poderemos saber com exactidão», disse à SIC Conceição Telhado, directora do serviço de Ginecologia do CUF Descobertas.

A grávida tem 34 anos e dois filhos. Este é o segundo caso que surge no espaço de três dias.
No passado domingo, um outro bebé, também de 34 semanas, morreu no Hospital de Portalegre depois da sua mãe, de 31 anos, ter tomado a vacina contra a Gripe A. Os especialistas, assim com a autópsia, não encontraram qualquer relação entre a vacina e a morte do feto.

O tvi24.pt tentou contactar diversas vezes o Ministério da Saúde para obter mais esclarecimentos, mas não obteve qualquer resposta.

Two women lose babies after swine flu jab in Portug

The Flu Case, 18 November 2009 15:17
https://web.archive.org/web/20100102053633/http://theflucase.com/index.php?option=com_content&view=article&id=1856%3Atwo-women-lose-babies-after-swine-flu-jab-in-portugal&catid=1%3Alatest-news&Itemid=64&lang=en

A pregnant woman who took the swine flu jab on Friday was rushed to the CUF Descobertas on Monday but lost her baby, according to the Jose de Mello, a Portuguese health official.

TV42.pt reports that the 34-year-old woman is still in hospital and has yet to give birth to the lifeless fetus.

Conceca Talhado, the head of the gynaecology department at CUF Descobertas said that an autopsy would be needed to establish whether there was a link between the swine flu vaccine and the death of the fetus.

On Sunday, another baby, also in the 34th week died in Portalegre hospital after the 31-year-old mother took the swine flu jab.

Record

Novo feto sem vida em grávida vacinada:
É o Segundo Caso em Apenas Três Dias

Recxord, 17 novembro 2009, 20:54
https://www.record.pt/fora-de-campo/detalhe/novo-feto-sem-vida-em-gravida-vacinada

Uma grávida recentemente vacinada contra a gripe A deu ontem à noite entrada no Hospital CUF Descobertas, em Lisboa, com o feto já sem vida, confirmou fonte do gabinete de comunicação do grupo José de Mello Saúde.

"Podemos confirmar que deu entrada esta segunda-feira à noite no hospital CUF Descobertas uma grávida de 34 semanas cujo feto estava sem vida, disse a fonte, que garantiu também que a grávida tinha sido vacinada contra a gripe A.

Este é o segundo caso em apenas dois dias e com contornos muito idênticos. No passado domingo, deu entrada no Hospital de Portalegre uma mulher grávida, também de 34 semanas, com o feto morto, que fora igualmente vacinada contra o vírus da gripe A três dias antes.

cm SOCIEDADE

Segunda grávida vacinada perde bebé

CM Journal, 18 de Novembro de 2009 às 00:30
https://www.cmjornal.pt/sociedade/detalhe/segunda-gravida-vacinada-perde-bebe

Uma mulher de 34 anos, grávida do terceiro filho, perdeu o bebé, segunda-feira à noite, três dias depois de ter sido vacinada contra a gripe A. Trata-se da segunda morte de um feto, num espaço de três dias, após a imunização da mãe, depois do caso ocorrido em Portalegre. Em ambas as situações, as mulheres estavam grávidas de 34 semanas.

A mulher de 34 anos deu entrada no Hospital da CUF Descobertas, no Parque das Nações, em Lisboa, já com o feto sem vida. Tinha sido vacinada na sexta-feira. Segundo fonte do hospital, a mulher encontrava-se ontem à noite em trabalho de parto induzido. A autópsia só será realizada caso os pais assim o decidam.

"Era uma gravidez normal. Foi observada e vimos que o feto não apresentava batimentos cardíacos. Não parece haver relação causa-efeito entre a vacina e a morte do feto. Mas só depois do parto e da autópsia poderemos saber com exactidão", explicou Conceição Telhado, directora do serviço de Ginecologia do CUF Descobertas.

Jorge Branco, director da Maternidade Alfredo da Costa, garantiu ao CM que "vai continuar a haver fetos mortos em Portugal", reforçando a ideia de que não há relação entre as mortes e a vacinação. "Não existe uma relação causal. Reino Unido, Alemanha, Noruega, Suécia, Finlândia e Dinamarca têm a mesma vacina que nós e só existem mortes em Portugal devido à vacinação?", questionou o médico, sublinhando que "é mais perigoso para a mãe não ser vacinada do que ser". Em Portugal morreram 256 fetos ao longo de 2008, e 289 em 2007.

Gripe Vista à Lupa

8 mortes registadas em Portugal consequência da gripe A. O primeiro caso fatal aconteceu a 23 de Setembro, no Hospital Santo António, no Porto.

Pediatras
Os pais estão a pedir aconselhamento aos pediatras antes de levarem os seus filhos à vacinação contra a gripe A.
"*Não há relação entre a morte do feto e a vacina contra a gripe a*", Francisco Georg, Director-geral da Saúde

Família Suspeita de Negligência

O feto que morreu com 34 semanas depois de a mãe ter sido vacinada contra a gripe A no Centro de Saúde de Portalegre foi ontem a enterrar. A autópsia não foi conclusiva, mas os pais de Margarida querem apurar a verdade sobre a morte da bebé e aguardam pelo relatório final para tomar uma posição.

João Romacho, tio da bebé, disse ontem ao CM que pode haver outras responsabilidades neste processo além das suspeitas da vacina: "A morte pode não estar relacionada directamente com a vacina. Mas a minha cunhada estava a tomar antidepressivos e essa medicação pode ter tido alguma interacção com a vacina." João acrescenta que a família suspeita que houve uma atitude negligente de quem assistiu a cunhada: "Se o coração da bebé estava fraco ficava internada e não mandavam a mãe para casa".

Enfermeiros de Quarentena em Benfica

O Centro de Saúde de Benfica está a funcionar apenas com três dos seis enfermeiros de que dispõe. De acordo com José Santos, do conselho clínico, três dos profissionais estão em casa, "não foram vacinados e, por acaso, têm a sintomatologia da gripe A mas não têm um diagnóstico confirmado". A falta de enfermeiros agravou a sobrecarga de trabalho, nomeadamente nos serviços de vacinação.

Com o início do processo de imunização das crianças dos seis aos 24 meses, os enfermeiros não têm mãos a medir. "O telefone não pára. Tendo em conta esta situação devia ser equacionado reforço dos recursos", declarou José Santos.

THE FLU CASE

Third case of woman losing baby after Pandemrix jab in Portugal

The Flu Case, 19 November 2009, 10:09
https://web.archive.org/web/20100102035517/http://theflucase.com/index.php?option=com_content&view=article&id=1869%3Athird-case-of-woman-losing-baby-after-pandemrix-jab-in-portugal&catid=1%3Alatest-news&Itemid=64&lang=en

A pregnant woman who took the Pandemrix swine flu jab was rushed to the Hospital de Santo André, em Leiria in Portugal but lost her baby.

This is the third case in a few days in Portugal but health officials say they cannot confirm any link betewen the death of the baby and the Pandemrix vaccine in spite of the fact there is a huge body of scientific evidence that these vaccines for which there are oddly no clinical data but which are classified as bioweapons by EU and US authorities are damaging.

The 27-year-old was 20 weeks pregnant and was vaccinated ot the begining of this month.

My boy's agonising death after virus vaccination

Bild, 20 November 2009, 10:42 Uhr
https://www.bild.de/news/bild-english/my-boy-finlay-agonising-death-after-vaccination-10498524.bild.html

With trembling hands, the distraught mother stroked the yellow bear which belenged to Finlay – her beloved son. The little boy died two weeks ago at the age of 21 months after having a vaccination against swine flu.

Doctors reported the case to the Paul Ehrlich Institute as a possible result of a deadly reaction to the virus inoculation.

Mother Yvonne B. (34), a nurse for the elderly in Berlin, said: "Finlay was born with a heart defect and damaged lungs. He had been operated on four times. Now he was waiting in hospital for a new heart and a new lung.

"He was doing quite well. We went out with him everyday. He played in the leaves and liked to watch birds."

Doctors told the parents that the tot should be inoculated, mirroring the advice of the standing committee on vaccinations.

Mom-of-three Yvonne added: "They said the side effects would be no problem, but that swine flu would be a real danger to our son. On top of that, a patient in the room next door had been diagnosed with swine flu."

In the afternoon the boy was vaccinated. On the next day he was still laughing and happily playing around in the leaves.

But in the night, his condition suddenly worsened. He vomited and fluid got into his lung. The organ failed, and then so did his heart.

The devastated mother said: "We were called at night. Finlay fell asleep on my husband's arm."

Immediately a horrific thought surfaced - was the H1N1 virus vaccination to blame for the agonising tragedy?

"The assumption is simply an obvious one! At least that the vaccination played some kind of role."

The parents consented to an autopsy of their son. "The Pathological Institute told us yesterday they couldn't exclude a connection, but also that there was nothing speaking for it compellingly.

"If I had the choice again, I would not let my son be vaccinated."

The investigation of the boy's death is still ongoing.

A week ago the parents carried their son to his grave. "He had an unbelievable willingness to live. We never thought for a second that he wouldn't make it," said his mother.

Arepanrix: Une expérimentation illégale:
Vaccination de femmes enceintes avec PandemRix

Mondialisation.ca, 20 Novembre 2009
https://www.mondialisation.ca/arepanrix-une-exp-rimentation-ill-gale/16097?doing_wp_cron=1708587701.8948469161987304687500

Dans la défense de l'action en justice que des médecins et citoyens ont intentée pour garantir plus de transparence sur les risques et bénéfices du vaccin PandemRix en Belgique, (voir la requête en PDF) l'intimé (l'Etat Belge) niait que cette campagne de vaccination était en même temps une expérimentation (voir la première assignation).

Je reprends ci-dessous un passage du texte des appelants (l'Initiative Citoyenne de Mlle Meulemans et cie) qui exigent que le caractère expérimental de cette vaccination soit rendu claire, nécessitant un comité d'éthique, et/ou tout le moins une information non biaisée à toutes les personnes concernées, avec la signature d'un formulaire de consentement libre et éclairé pour toute personne désirant se faire vacciner.

Début de l'extrait à [«Dans son dossier, l'intimé justifiait ses actions en se fondant sur le principe de précaution et produisait une pièce n°1 émanant de l'EMEA (non datée) et intitulée «Vaccins grippaux pandémiques A(HINl) autorises selon une procédure de dossier prototype («Mock-up»)».

Pour les appelants, loin d'être une «précaution», la vaccination notamment des femmes enceintes pose de graves questions et constitue une «expérimentation» interdite par la loi;

En page 10/12, ce document indique sous le titre «FEMMES ENCEINTES»:
«*Expérience avec les vaccins grippaux sans adjuvant:*
Le bénéfice des vaccins grippaux a été rarement étudié de façon spécifique dans cette population, et il n'y a pas de données provenant d'études randomisées contrôlées. » Des données de sécurité des vaccins saisonniers grippaux inactives et sans adjuvant chez la femme enceinte et issue d'essais cliniques sont très limitées.»
«Expérience avec les vaccins pandémiques: Pour les deux vaccins pandémiques (Focetria/Pandemrix), il n'y a pas de données cliniques disponibles chez la femme enceinte.»

Pandemrix
Des études précliniques de toxicité sur la fertilité maternelle, l'embryon, le fœtus et le nouveau-né (jusqu'à la fin de la période de lactation) ont été réalisées chez le rat… Aucune donnée n'est disponible sur l'administration du vaccin au moment de la phase d'implantation de l'embryon. I1 n'y a pas de données disponibles chez la femme enceinte avec un vaccin qui contient l'adjuvant AS03.

«… la sécurité des vaccins chez la femme enceinte et leur efficacité clinique sera surveillée étroitement, dans le cadre du plan de gestion de risque. Des études observationnelles sur la base de registre existant de grossesse sont planifiées.»

Il est donc sur basé de cette pièce n° 1 produite par l'intimé, indiscutable que concernant l'administration du PANDEMRIX à des femmes enceintes:

1. il n'existe que quelques données pré-cliniques du PANDEMRIX qu'avec des rats
2. il n'existe pas d'étude d'efficacité
3. il n'existe pas d'étude de bénéfice
4. il n'existe aucune donnée clinique
5. il n'existe pas d'étude de toxicité
6. la situation est pré-clinique et observationnelle.

Il n'est donc pas contestable, en l'espèce, que l'administration du PANDEMRIX aux femmes enceintes revêt un caractère expérimental ; » ß fin de l'extrait.]

En Belgique nous avons entendu le professeur Nathan Clumeck sur les ondes de la télévision vouloir rejeter toute notion que cette vaccination relève d'un caractère expérimental. Nous avons aussi, suite au témoignage émouvant du professeur Yvon Englert du service de gynécologie d'Erasme, reçu la déclaration du Groupement des Gynécologues Obstétriciens de Langue française de Belgique du 2 novembre 2009, qui appellent toutes les femmes enceintes en deuxième et troisième trimestre de grossesse à aller se faire vacciner avec le PandemRix.

Ce que GGOLFB mentionne dans son communiqué concernant l'adjuvant de PandemRix c'est que les «conséquences à long terme chez le fœtus semblent être minimes et non chiffrables».

Cette phrase est extraordinaire: ce sont nos connaissances sur les «conséquences à long terme chez le foetus» qui «semblent être minimes», et si nous donnons ce vaccin expérimental en masse aux femmes enceintes, les «conséquences à long terme» pourront être «non chiffrables», c'est-à-dire INCALCULABLES!

Revenons maintenant aux seules données pré-cliniques dont nous disposons, et que le GGOLFB semble vouloir dire que l'importance est minime: à la page 18 de la notice destinée aux patients concernant la sécurité du (PandemRix vendu au Canada sous le nom ArepanRix, nos pas si cons citoyens Canadiens peuvent prendre part des résultats de deux études sur la sécurité du Pre-Pandrix, (qui utilise la même mixture d'adjuvants ASO3 que le PandemRix/ArepanRix) C'est écrit sous la rubrique:

Pre-clinical Safety Data

"*Two reproductive studies were conducted with ASO3-adjuvanted H5N1 antigen and evaluated the effect on embryo-fetal and peri-and post-natal development in rats, following intramuscular administration. Although no definite conclusion could be reached, regarding a possible relation to treatment with the H5N1 vaccine and/or the adjuvant ASO3, and other findings were considered normal, the following observations deserve to be mentioned:*

In the first study, there was an increased incidence of fetal malformations with markedly medially thickened kinked ribs and bent scapula as well as an increased incidence of dilated ureter and delayed neurobehavioral maturation.

In the second study, there was an increased incidence of post-implantation loss, and the fetal variation of dilated ureter. Not all findings were observed in both studies, and hence the toxicological significance is uncertain."

(Source: Arepanrix H1N1 Vaccine .pdf Exposed, à partir de 2 min30sec.) Traduction en Français pour l'éclaircissement du Groupement des Gynécologues Obstétriciens de Langue Française de Belgique:

Concernant la sécurité pré-clinique (la seule donnée concernant la sécurité de ce vaccin sur leur utilisation sur les femmes enceintes avant le début de l'étude OBSERVATIONELLE, notamment sur 8000 femmes enceintes qui ont été vaccinées en octobre 2009 en Suède)

«Deux études ont été menées avec l'antigène H5N1 adjuvanté en ASO3 et ont évalué les effets sur le développement embryo-foetal et péri- et post-natal chez les rats, suite à une injection

intramusculaire. Bien qu'une conclusion définitive n'ait pas pu être établie vis-à-vis d'une relation possible au traitement avec le vaccin H5N1 et/ou l'adjuvant AS03, et que les autres données de l'essai semblaient normales, il convient de mentionner l'observation suivante. Dans la première étude, il y avait une incidence accrue de déformations fœtales, surtout les côtes étaient épaissies sur leur partie médiale, avec des plis anormaux, et des omoplates pliées, ainsi qu'une incidence accrue d'uretères dilatés et des retards dans la maturation neuro-comportementale. Dans la deuxième étude il y avait une augmentation de l'incidence de perte de grossesse post implantation, et de la variation fœtale d'uretère dilaté. Tous les phénomènes n'ont pas été observés dans les deux études, et donc la signification toxicologique de ces études demeure incertaine.»

Je pense que, contrairement à certains experts à l'EMEA et l'OMS, les futures mères canadiennes savent très bien lire, car j'entends des rapports qu'il y a des centres de vaccination ouverts là-bas depuis plusieurs jours qui n'ont pas vu arriver le moindre chat!

En dehors de tous les risques et incertitudes déjà connus sur ce vaccin, les lecteurs et lectrices canadiens peuvent prendre connaissance de cette information non sans importance que ce que nous savons sur l'utilisation de PandemRix/ArepanRix concernant la grossesse, c'est que dans des études de sécurité pré-cliniques, les rates enceintes qui avait reçu du «Pre-Pandrix» avec le même adjuvant ont eu des petits avec une incidence accrue de malformations, du retard dans la maturation neurocomportementale, des pertes précoces de l'embryon et des fausses couches.

Cette information ne figure ni sur www.influenza.be, ni sur le communiqué de www.ggolfb.be, mais il est pourtant de nature à intéresser aussi les femmes enceintes belges qui se demandent s'il vaut mieux se vacciner avec le PandemRix ou pas.

Il y a actuellement une bonne estimation du risque réel que l'infection «sauvage» par le H1N1 nous fait courir.

Par contre, les risques à long terme de cette vaccination de jeunes enfants et de femmes enceints sont, comme le GGOLFB le dit, «non chiffrables», c'est-à-dire INCALCULABLES.

Sachant que déjà à court terme, et par les vaccins anti-H1N1 plus classiques utilisés aux Etats-Unis, les effets secondaires commencent à être rapportés en avalanche et sachant que les études de sécurité pré-cliniques concernant les femmes enceintes était tout sauf rassurants (voir ci-dessus) et que le PandemRix contient, en dehors du squalène qui n'a jamais été évalué chez la femme enceinte, également du fœto-neurotoxique thiomersal, du polysorbate 80 et du formaldehyde, soyons un peu sérieux, et arrêtons maintenant de recommander une vaccination de masse de ce produit qui n'a nullement démontré son innocuité ou son bénéfice chez les femmes enceintes!

Membre de l'Initiative Citoyenne qui en tant que médecin exige du gouvernement belge que le caractère expérimental de la vaccination avec le PandemRix soit immédiatement communiqué par le billet de l'exigence d'un formulaire de consentement libre et éclairé à tous les médecins et les patients susceptibles de (se) vacciner. Sur ce formulaire, qui reprend les Contra-Indications absolues et relatives (maladies auto-immuns) du PandemRix, le médecin et son patient devront aussi s'engager à rapporter tout effet secondaire mal vécu, mais étant donnée les nombreuses tâches urgents quotidiens pour le médecins à accomplir, et le fait que ce rapportage n'est nullement obligatoire, mais bénévole, il est très souhaitable que le patient ai aussi un endroit ou se tourner, pour rapporter l'effet secondaire directement. L'Agence Française de Sécurité Sanitaire des Produits de Santé a mis un formulaire comme cela à disposition du public, et nous devons indiquer une site pareil sur nos formulaires en Belgique.

Il est grand temps que le rapport bénéfices/risques de cette vaccination par le produit peu étudié «PandemRix» soit analysé par un comité d'éthique indépendant, car les risques du virus «sauvage» A/H1N1 ne sont pas énormes, et ont le bénéfice d'offrir une immunité naturelle qui dure 50 ans pour les jeunes qui l'attrapent qui n'ont jamais été en contact avec ce souche H1N1.

THE FLU CASE

GSK's Pandemrix Swine Flu shot caused damage to pregnant rats in pretrial studies

The Flu Case, 23 November 2009, 12:41

https://web.archive.org/web/20100102042044/http://theflucase.com/index.php?option=com_content&view=article&id=2025%3Agsks-pandemrix-swine-flu-shot-caused-damage-to-pregnant-rats-in-pretrial-studies&catid=41%3Ahighlighted-news&Itemid=105&lang=en

GlaxoSmithKline's Pandemrix swine flu jab caused damage to pregnant rats in pretrial studies, but governments are concealing this fact from people.

GlaxoSmithKlein saw increased rates of loss of pregnancies and malformations in offspring of PandemRix "mock-up" vaccinated offspring, but surprisingly documents of EMEA and WHO do not mention these disturbing abnormalities remarks Dr Eric Beeth.

Dr Beeth joined a citizen's initiative taking the government to court to protect his profession of General Practioners from unknowingly participating in an illegal experimentation on pregnant women, and practicing the experimental vaccination without an informed consent form.

The dangers of this type of government protected experimentation is especially transparent when it comes to pregnant women, where no data, except the NOT very reassuring reproductive toxicity pre-clinical trials on rats existed before the experimental vaccine was tried out on a massive scale on pregnant women: those whom we must protect the most from all types of known and unknown drugs/pharmaceutical products.

Four pregnant women in Belgian are currently engaged in a legal action to obtain Non-Experimental, standard procedure H1N1 flu shots, without adjuvants, and preferably no thiomersal either.

In his article on www.mondialisation.ca, Dr Beeth quotes a paragraph in English from a study showing that offspring from pregnant rats that were given Pandemrix had an *increased incidence of foetal malformations*: the quote is taken from page 18 of this GSK patient information PDF in Canada: http://www.gsk.ca/english/docs-pdf/Arepanrix_PIL_CAPA01v01.pdf

In a report in French, Beeth quotes a paragraph from a study showing that rats who were given Pandemrix had an increased incidence of fetal malformations.

There have been no clinical trials on pregnant women.

Pharmaceutical companies such as GSK might be expected to carry out these trials if there is evidence of such fetal malformations in rats. Their failure to do so suggests a deliberate attempt to manipulate clinical trials data to get an dangerous drug through to cause damage to pregnant women.

Four pregnant women in Belgian are planning legal action against the government for recommending the dangerous Pandemrix to pregnant women without adequate data.

This is an extra from the report in French

"Two reproductive studies were conducted with ASO3-adjuvanted H5N1 antigen and evaluated the effect on embryo-fetal and peri-and post-natal development in rats, following intramuscular administration. Although no definite conclusion could be reached, regarding a possible relation to treatment with the H5N1 vaccine and/or the adjuvant ASO3, and other findings were considered normal, the following observations deserve to be mentioned:

In the first study, there was an increased incidence of fetal malformations with markedly medially thickened kinked ribs and bent scapula as well as an increased incidence of dilated ureter and delayed neurobehavioral maturation.

In the second study, there was an increased incidence of post-implantation loss, and the fetal variation of dilated ureter. Not all findings were observed in both studies, and hence the toxicological significance is uncertain."

Les élèves transportés et vaccinés dès mercredi

Le Journal de Québec, 21 novembre 2009, 19h58
https://www.journaldequebec.com/2009/11/20/les-eleves-transportes-et-vaccines-des-mercredi

Les élèves du préscolaire et du primaire pourront aussi se prévaloir du privilège.

C'est dès mercredi que les élèves de la Commission scolaire de Montréal (CSDM) se rendront en autobus au centre de vaccination massive le plus près de chacune des écoles pour recevoir le vaccin contre la grippe A(H1N1).

Jeudi dernier, des formulaires ont été remis aux élèves de 14 ans et moins pour que les parents les remplissent et les retournent dès lundi à l'école de leurs enfants, pour que la direction de chaque établissement puisse organiser le transport des élèves.

Contrairement à ce que certains médias ont avancé, ce ne sera pas que les élèves du secondaire qui seront vaccinés. Ceux du préscolaire et du primaire pourront aussi se prévaloir du privilège.

«Nous aurons entre 50 et 70 autobus disponibles à tous les jours, jusqu'au 17 décembre», explique Alain Perron, porte-parole de la CSDM.

Si la commission scolaire s'aperçoit qu'elle manque de temps pour faire vacciner tout le monde, il sera possible de poursuivre le processus au retour du congé des fêtes, en janvier.

Éviter l'engorgement

M. Perron tient à rappeler que les parents devraient eux-mêmes s'acquitter de cette responsabilité au lieu que ce soit l'école qui s'en charge.

«Il y a une journée pédagogique aujourd'hui (vendredi). Les parents pouvaient donc aller faire vacciner leurs enfants et ils pourront aussi le faire samedi et dimanche», ajoute le porte-parole.

Cela permettrait d'ailleurs à la CSDM d'éviter d'être débordée par la demande au moment d'organiser le transport de ces élèves vers les centres de vaccination.

Le coût relié aux transports de ces élèves n'est toujours pas connu puisqu'il est impossible de savoir pour le moment combien d'élèves se prévaudront du service offert par la commission scolaire.

THE FLU CASE

School kids in Montreal to be bused to swine flu vaccine centres from Wednesday

The Flu Case, 21 November 2009, 13:22
https://web.archive.org/web/20100102053209/http://theflucase.com/index.php?option=com_content&view=article&id=2007%3Aschool-kids-in-montreal-to-be-bused-to-swine-flu-vaccine-centres-from-wednesday&catid=41%3Ahighlighted-news&Itemid=105&lang=en

50 to 70 buses are ready to transport children belonging to Montreal's school district to the pupil's nearest swine flu vaccine centers from Wendesday.

Last Thursday, parents were given consent forms to fill out for kids of 14 or under.

Should pregnant women have the swine flu jab?

This is Oxfordshire, 22 November 2009, 7:00AM GMT
http://www.thisisoxfordshire.co.uk/news/4752630.At_risk_shun_swine_flu_jab/?ref=rss

I sat and looked at my in-box. It was the third email I'd received about this in as many days. What was I going to say? These emails were from three good friends, all of whom were pregnant and asking the same question: should they have the swine flu jab or not?

"Everyone keeps telling me to have this," said one of them; "I feel under so much pressure from the hospital, I just don't know what to do," wrote another. The tone of all three emails was of feeling forced into something they weren't sure about, and it made me feel acutely uncomfortable.

The UK swine flu vaccination programme is well underway and the first wave should be completed by Christmas. More than 11million people from groups deemed a "priority", including pregnant women, are being offered the jab, alongside two million health and social care staff. But things have not gone smoothly. Research published last week suggests that, so far, more than half the patients offered the vaccine have turned it down. Central to this seems to be concerns regarding safety. This is not helped by the perception that the infection is mild and therefore not worth the potential risk associated with vaccination. Resistance to the jab is particularly high among pregnant women, with only 46 per cent accepting it.

The medical profession has reacted angrily to this state of affairs, seeing it as irresponsible. Last week the Government published online information and leaflets aimed at persuading pregnant women to accept the injection. All three of the friends who emailed me said that they were being made to feel they had to have it, and that health staff had brushed aside their concerns.

The politics surrounding vaccination are complex, and pregnant women as a cohort have a history of scepticism regarding vaccines, initiated by the MMR furore. However, there is a case for a degree of coercion with some vaccinations. Many of the childhood vaccinations rely on "herd-immunity" – a certain percentage of the population having the vaccine in order to protect those that do not, or cannot have it, from infection. In these cases, it can be argued it is a civic responsibility to be vaccinated. But this is not the case with swine flu.

Because of the pandemic nature of the infection, the benefits from inoculation operate on an individual level only. It should therefore be down to each person to make a choice. But it is a difficult choice to make.

On the one hand, there is evidence to suggest that pregnant women are at increased risk of severe disease, particularly in the later stages of pregnancy and that they are ten times more likely to be admitted to an intensive care unit compared with the general population.

On the other hand, most pregnant women won't get swine flu and most of those that do won't be severely affected. Vaccination is not without risk in itself, and pandemic flu vaccines have been associated with a rare neurological condition known as Guillain Barre Syndrome (GBS).

Swine flu vaccines used in the US in 1976 resulted in one case of GBS per 100,000. This is a very small number, but it still meant that more people died as a result of the vaccine than from swine flu. Within the medical profession, some have raised concerns about the unknown effects of the additives in the vaccines, in particular a substance called squalene.

Dr Tom Jefferson, coordinator of the vaccines section of the Cochrane Collaboration, stated that "none of the studies we've extracted have any research on it at all". So the dilemma facing pregnant women is that there is a small but quantifiable risk associated with infection and an unknown but probably only very small risk associated with the vaccine.

When dealing with such fragile certainties, I'm not surprised people are unsure what to do. To dismiss these women's concerns as a hysterical, misinformed reaction does them a disservice.

But it is the responsibility of doctors to inform patients and allow them to make a decision based on this knowledge, not browbeat them into submission. At this early stage of risk-analysis, who can say what the right decision is, yet all three of my friends feel under pressure to have the vaccination, as though there was no real choice in the matter.

While the Government and medical profession may not agree with an individual decision, if there is no risk to the population at large, then it remains their choice. It is they, after all, who will have to deal with the consequences. Arguably, the one exception to this is medical staff who have a responsibility to their patients, and therefore they do have a civic duty to be vaccinated. I'm having mine next week. As for my three pregnant friends, the decision, while difficult, remains theirs.

At-risk shun swine flu jab

This is Oxfordshire, 22 November 2009
https://www.thisisoxfordshire.co.uk/news/4752630.at-risk-shun-swine-flu-jab/

Pregnant women, heart disease patients and people with kidney problems are putting their health on the line by shunning the swine flu vaccination.

About 120,895 Oxfordshire people are considered to be most at risk of contracting the ailment.

But GP surgeries across the county have recorded only a 50 per cent take-up among this group, with pregnant women the most reluctant to have the vaccination.

NHS Oxfordshire, the new name for Oxfordshire Primary Care Trust, last night urged everyone who falls into the high-risk category to have the injection.

Those deemed most susceptible to the H1NI virus are people with long-term illness, such as chronic liver, heart and kidney diseases, and pregnant women.

From next month, a national programme will also begin to vaccinate all children under five.

Angela Baker, consultant in public health for Oxfordshire Primary Care Trust, said pregnant women and those who lived in high deprivation in areas of Banbury and Oxford were not taking up the swine flu jab as well as hoped.

She said: "There are two very different groups of people who are not taking up the vaccination.

"Those who don’t believe in healthcare and are not engaged with local health services, who tend to live in more deprived areas.

"And there are those who have made a very informed choice not to have the vaccine.”

The Department of Health said swine flu increases the risk of complications such as miscarriage and premature labour in pregnant women.

It has launched a national campaign to encourage more expectant mothers to have the jab.

Take-up rates have varied across the county, from as low as 30 per cent in Headington to as high as 80 per cent in Chipping Norton, although NHS Oxfordshire said the variation could be partly explained by delays in delivery of the vaccine to some GP surgeries.

The county saw an average of a 50 per cent take-up among the high-risk group, according to NHS Oxfordshire.

Dr Baker said although pregnant women were the most likely to shun the jab, they were among the most at risk.

She added: "Ten per cent of all people hospitalised because of swine flu are pregnant women.”

She added that 10 of the more than 120 people who had died from swine flu across the country had been pregnant women.

Mother-of-two Samantha Tong, 37, of Abingdon Road, Oxford, said she was still unsure whether she would have the free swine flu vaccination.

Mrs Tong, whose third child is due in six weeks, said pregnant women could be reluctant because the vaccine had not been around long enough for them to make an informed choice.

She said: "I don’t think we’re being told enough about it.

"I have spoken with my midwife and doctor, and still don’t know whether I am going to have it.

"You have to weigh up what the damage is likely to be to your unborn baby, and what would happen if you were to fall ill.

"It’s a very difficult decision to make.”

Julie Osborne, a breastfeeding counsellor for the Baby Cafe breastfeeding clinics in Oxford, said many mothers were talking about the vaccine.

She said: "A lot of mums and pregnant women are trying to decide what to do.

"People feel they don’t know enough about it one way or the other to be able to make a choice. "However, Dr Baker said pregnant women should feel reassured.

She added: "The only way we can properly protect people from swine flu is by vaccinating them before they become too ill.”

THE FLU CASE

GSK's Pandemrix Swine Flu shot caused damage to pregnant rats in pretrial studies

The Flu Case, 23 November 2009, 12:41

https://web.archive.org/web/20100102042044/http://theflucase.com/index.php?option=com_content&view=article&id=2025%3Agsks-pandemrix-swine-flu-shot-caused-damage-to-pregnant-rats-in-pretrial-studies&catid=41%3Ahighlighted-news&Itemid=105&lang=en

GlaxoSmithKline's Pandemrix swine flu jab caused damage to pregnant rats in pretrial studies, but governments are concealing this fact from people.

GlaxoSmithKlein saw increased rates of loss of pregnancies and malformations in offspring of PandemRix "mock-up" vaccinated offspring, but surprisingly documents of EMEA and WHO do not mention these disturbing abnormalities remarks Dr Eric Beeth.

Dr Beeth joined a citizen's initiative taking the government to court to protect his profession of General Practioners from unknowingly participating in an illegal experimentation on pregnant women, and practicing the experimental vaccination without an informed consent form.

The dangers of this type of government protected experimentation is especially transparent when it comes to pregnant women, where no data, except the NOT very reassuring reproductive toxicity pre-clinical trials on rats existed before the experimental vaccine was tried out on a massive scale on pregnant women: those whom we must protect the most from all types of known and unknown drugs/pharmaceutical products.

Four pregnant women in Belgian are currently engaged in a legal action to obtain Non-Experimental, standard procedure H1N1 flu shots, without adjuvants, and preferably no thiomersal either.

THE FLU CASE

Vaccination of French kids to start on Wednesday
Parents must sign Consent Forms

The Flu Case, 23 November 2009.

https://web.archive.org/web/20100102004610/http://theflucase.com/index.php?option=com_content&view=article&id=2029%3Avaccination-of-french-kids-to-start-on-wednesday-parents-must-sign-consent-forms&catid=1%3Alatest-news&Itemid=64&lang=en

The mass vaccination of children in France's schools is to begin on Wednesday by means of the use of mobile vaccination teams amid intense government and media hype about the threat of the swine flu.

Over 200 schools in France have been closed so far, on account of the virus.

Parents must give their consent to the jab.

HELSINGIN SANOMAT

Aivokuolleen naisen vauva pelastettiin keisarileikkauksella Kuopiossa

Helsingin Sanomat, 24 November 2009, 12:16
https://web.archive.org/web/20091127092033/http://www.hs.fi/kotimaa/artikkeli/Aivokuolleen+naisen+vauva+pelastettiin+keisarileikkauksella+Kuopiossa/1135250982190

(STT) Kuopio. Aivokuolleen 26-vuotiaan naisen poikavauva pystyttiin pelastamaan keisarileikkauksella Kuopion yliopistollisessa sairaalassa, kertoo Ilta-Sanomat. Vajaan kilon painoinen poika toipuu parhaillaan sairaalan keskososastolla.

Keisarileikkaus tehtiin viime torstaina vain muutama tunti sen jälkeen, kun halvauksesta jo toipumassa olleen äidin aivotoiminta yllättäen lakkasi. Menossa oli 28. raskausviikko.

"Hyytymää aivoissa ei raskauden takia päästy missään vaiheessa hoitamaan, ja se aiheutti lopulta aivokuoleman", kertoo sairaalan johtajaylilääkäri Jorma Penttinen lehdelle.

Menehtynyt pohjoiskarjalainen nainen sai halvauskohtauksen vain pari tuntia sen jälkeen, kun hän oli saanut sikainfluenssarokotuksen kotipaikkakunnallaan viime kuun loppupuolella.

Yliopistosairaala (Kys) kiisti jo tämän kuun alussa epäilyt, että rokote olisi aiheuttanut halvausoireet. Kysin mukaan verihyytymä ja tukos olisivat voineet sattua potilaalle milloin tahansa, koska raskaus altistaa keinoläppäpotilaat hyytymille. Naiselle oli asennettu viisi vuotta sitten sydämen keinoläppä, minkä vuoksi hänellä oli veren hyytymistä estävä lääkitys.

Ilta-Sanomien mukaan nainen oli jo pitkään yrittänyt saada lapsen sairautensa aiheuttamista riskeistä huolimatta. Lehden haastattelemien lääkäreiden mukaan tapaus on hyvin harvinainen.

Woman in Finland paralysed hours after Swine Flu jab, gives birth to living baby

The Flu Case, 24 November 2009, 20:53
https://web.archive.org/web/20100102015303/http://theflucase.com/index.php?option=com_content&view=article&id=2051%3Awoman-in-finland-paralysed-hours-after-swine-flu-jab-gives-birth-to-living-baby&catid=1%3Alatest-news&Itemid=64&lang=en

(STT) Braindead woman gave birth to a living baby in Kuopio, Finland. According to a Finnish tabloid Ilta-Sanomat, a baby boy of a 26-yeras old braindead woman was saved using a caesarean section in the University Hospital in Kuopio Finland.

The section took place last Thursday only a couple of hours later after the brain activity of the mother, who was already recovering from paralysis, suddenly stopped. It was 28th week of her pregnancy.

"The clot on her brain during the pregnancy couldn't be cured at any stage, and that eventually caused the brain death", tells the head physician Jorma Penttinen. Deceased woman from north Karelian, Finland, *had paralysed only a couple of hours after she had received the swine flu vaccine* on her home town at the end of last month.

The University Hospital (KYS) denied all the suspicions of possible link between the vaccine and the paralysis symptoms already at the beginning of this month.

According to KYS, the clot and the blockage could have taken place at any time, because pregnancy exposes to clots those patients who have heart valve replacements. There was a heart valve replacement done for the deceased woman five years ago and beacause of that, she had a medication for preventing clots.

According to Ilta-Sanomat, the woman had tried to have a baby for a long time already, despite the risks of her illness. The doctors that the paper interviewed, said that this was a very rare case.

Parents ignore swine flu vaccination programme

The Foreigner, 26 November 2009, at 12:40
https://web.archive.org/web/20101003035534/http:/theforeigner.no/pages/news/parents-ignore-swine-flu-vaccination-programme/

False sense of immunity

50 percent of parents living in Stavanger haven't taken their children to be vaccinated, despite recommendations by the health authorities.

Bjørn Iversen, senior medical officer at the Norwegian Institute of Public Health, believes that parents and children have lulled themselves into a false sense of security regarding the swine flu.

"Some believe that the danger of infection is over as the second wave is on the decline. Young people think they're not vulnerable, and that nothing can happen to them," he tells The Foreigner.

The institute is unsure for the moment as to if there'll be a third round of outbreaks, but Iversen says previous pandemics have shown that there are several waves. He recommends people take their children to be vaccinated as a precaution.

"Vaccinating children is a good way of limiting the spread, because children are the most effective transmitters of illness."

Scepticism

But Iversen admits they have a task on their hands at a local and national level, for several reasons.

"One of the problems of the living in the Western world with its levels of prosperity and hygiene is that we don't see serious infections anymore. We don't relate to illness in the same way that they do in non-Western countries."

It was also difficult to convince doctors and nurses to be vaccinated at first, he says.

"However, their attitude changed quickly when young people started dying from the swine flu, or had to be put in a respirator because of it."

Challenges

Another problem is how the different Norwegian municipalities are organised.

"One of challenges in Norway is that all municipalities are autonomous. They decide themselves how the information should be distributed and what campaigns they should run. There are also different vaccination practices from municipality to municipality, with the worst differences occurring in separate parts of Oslo," he says.

The way forward

But he believes that more parents will also choose to vaccinate their children if the institute, different municipalities, and health care staff explain their point of view well enough.

"Parents need to be given enough information to give them a chance to reconsider their decision, and we also have to organise groups of immunisations in a way that's most convenient for them."

He says he's had the shot too.

"I didn't jump the queue, but was giving a lecture somewhere and offered the chance to be vaccinated in my lunch hour."

Swine flu vaccination for under-fives urged by HSE

Irish Times, 27 November 2009,00
https://www.irishtimes.com/news/swine-flu-vaccination-for-under-fives-urged-by-hse-1.779205

The HSE has urged parents with children under the age of five to avail of the swine flu vaccine, as it emerged that only a quarter of parents contacted by the HSE so far have brought their children for vaccinations. A vaccination programme for schoolchildren is due to begin next week.

Dr Pat Doorley, national director of population health with the HSE, has said that the low uptake among parents with children under five was a matter for concern due to the high rate of infection in that category.

"Children under five are a high priority group and . . . we are concerned that we are not getting a sufficient number of them vaccinated," Dr Doorley said.

Almost 150,000 letters have already been sent to about half of parents with children under the age of five. However, only 25 per cent have so far responded by bringing their child to a clinic for vaccination. "Those children who are not vaccinated are at risk of getting swine flu," Dr Doorley warned.

Parents who have not received letters will do so in coming weeks.

While babies under six months are not to be vaccinated, the HSE is proposing that they issue invitations to parents to get the entire family, including parents, brothers and sisters, vaccinated.

Although the rate of infection in children under the age of five has fallen, it is still significantly higher than the national average.

There are 290 cases of swine flu per 100,000 for children under five in comparison with 126.9 cases per 100,000 among the general population.

"We are still seeing significant rates of infection in children which is of concern to us," the Department of Health's chief medical officer, Dr Tony Holohan, said. "People are just not aware that the rates are still very high amongst children."

Meanwhile, vaccinations are to commence in primary and secondary schools next Monday. The vaccination programme for schools is expected to take two months to complete.

"Mostly children will be vaccinated in the school setting," Dr Doorley said.

"Those who are attending small schools will be vaccinated either in bigger schools or, in a small number of cases, in mass vaccination clinics."

It also emerged yesterday that a man with an underlying condition has died in the south of the country as a result of swine flu, bringing to 17 the number of deaths in the State resulting from the virus.

The rate of swine flu infections has fallen slightly from 134 cases per 100,000 last week to almost 127 cases per 100,000 this week.

A minimum of 240,000 people have received the swine flu vaccine; however, that figure could be up to two or three times higher depending on GP returns.

There have been 368 reports of adverse reactions although these have generally been mild.

THE FLU CASE

Irish parents prepare Non-Consent Letter
as unsigned Government sign Flu Jab "Invitations" come through Letter Box

The Flu Case, 27 November 2009, 11:12
https://web.archive.org/web/20100102045214/http://theflucase.com/index.php?option=com_content&view=article&id=2085%3Airish-parents-prepare-non-consent-letter-as-unsigned-government-sign-flu-jab-qinvitationsq-come-through-letter-box&catid=1%3Alatest-news&Itemid=64&lang=en

Letter for parents to non-consent of vaccination of children.

Note: Change the wording of this letter slightly and send same to HSE. Letters being posted by HSE at the moment, notifying parents of the imminent vaccination plans for our children, are not signed by any one responsible. Instead, the letter vaguely ends, 'Yours Faithfully, The Swine Flu Team'. This, lack of signature, is a contentious issue! Get your letter signed by a notary (link for notaries of Ireland below this letter) and send it by registered post. A little extra cost but well worth it for professionalism and to have a record.

Address this letter to School Principal (Nursing Staff).

(Cut the above information before printing your letter and it will fit on one page)

^^

From: (Your Name)
Date:
RE: Request for NON-vaccination of my child (child's name)
Dear Principal __________ (and nursing staff),

This letter is to inform you that as a parent of a child in your school, I do not consent to any H1N1 (Swine Flu) vaccination of my child, (Child's Name), and that if my child is subjected to such a vaccine without my permission, I will consider that a gross violation of not only my parental rights, but the civil rights of my child.

The H1N1 swine flu vaccines currently being given to schoolchildren in Ireland were approved using an unlawful waiver that allowed the vaccines to be approved with absolutely no credible scientific testing. No adequate safety or efficacy testing has been conducted on any of the swine flu vaccines, and those children who are being injected with the vaccines are being treated as human guinea pigs.

H1N1 swine flu has also turned out to be so mild that it can be easily overcome with a healthy immune system aided by healthy levels of circulating vitamin D.

As a parent, part of my responsibility to my child is to protect them from potentially dangerous chemicals or unproven medications that may cause neurological side effects. A previous batch of swine flu vaccines in 1976 are now known to have caused Guillain-Barre Syndrome (GBS), a serious neurological disorder that can cause paralysis or death. The risk of such side effects may be small, but they are permanent and not worth the claimed protection against a disease that is many times less virulent than regular seasonal flu.

Please make note that my child is not to receive any vaccinations without my prior written consent, and that if my child is subjected to vaccines of any kind without such permission, I will immediately seek legal counsel in an attempt to hold your school responsible for all long-term medical costs potentially associated with the vaccine side effects. I will also sue for violation of my child's civil rights.

Should such a scenario unfold, I also plan to go public with this story at both the local and national levels in order to bring increased awareness to this gross violation of parental rights. A copy of this signed and dated letter will be made available to the press to prove that I clearly and specifically requested my child NOT be vaccinated. I will also be happy to provide this documentation to whatever state regulators or law enforcement investigators may become involved at that point.

You may avoid all of this by honoring my request to safeguard my child from any and all H1N1 (Swine Flu) vaccines being given at your school, if that becomes policy.

Regards,

(Your Name) … (Notary stamp here)

THE FLU CASE

Jean-Yves Crevel

Lettre ouverte a tous les parents d'élèves et a leurs associations representatives

The Flu Case, 27 November 2009
https://web.archive.org/web/20100102021626/http://theflucase.com/index.php?option=com_content&view=article&id=2086%3Afrench-parents-write-open-letter-advising-against-signing-swine-flu-jab-consent-form-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Ce jour, 25 novembre 2009, nous sommes enjoints par l'éducation nationale de remplir un formulaire visant à autoriser la vaccination de nos enfants dans les établissements scolaires, en dehors de tout cadre habituel.

La veille, nous apprenions que les autorités canadiennes, constatant avec l'Organisation Mondiale de la Santé, un nombre anormal de réactions allergiques graves (dont une mortelle) viennent de retirer en urgence un lot de vaccins Arepanrix produit par le Laboratoire GSK.

A la lecture des documents officiels destinés à autoriser les vaccins Arepanrix au Canada et Pandemrix en France, nous constatons que, contrairement à ce qui a été affirmé précipitamment, ces deux vaccins sont identiques, seuls les noms diffèrent:
https://web.archive.org/web/20091229191059/http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832fr.pdf
(http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832fr.pdf)
http://www.hc-sc.gc.ca/dhp-mps/prodpharma/legislation/interimorders-arretesurgence/prodinfo-vaccin-fra.php

De plus, le 19 février 2009, le Comité Consultatif pour les Vaccins et les Produits Biologiques Associés de la FDA (Food and Drug Administration, chargée aux États-Unis de l'évaluation et de l'autorisation des médicaments) s'était réuni pour une audition publique. A cette occasion, le Dr Vaughn, représentant de GSK, a déclaré: «Alors que nous avons une grande expérience en matière de profil de sécurité pour le vaccin classique inactivé contre la grippe saisonnière chez les enfants de plus de six mois, il y a en général, une expérience très limitée concernant le profil de sécurité de l'ASO3 chez l'enfant» (l'AS03 désignant le squalène contenu dans les vaccins français et canadiens de GSK)

Par ailleurs, le formulaire qui est remis au parent vise ostensiblement à leur extorquer leur consentement:

Comme il l'a été relevé par la rédaction du journal télévisé de France2 (23 novembre2009 / 13 heures) la case «Non» aurait été «oubliée», l'éducation nationale prétend qu'il s'agit «d'une erreur».

Il est préalablement demandé de cocher une case à côté de laquelle figure la mention «J'ai reçu une information sur le vaccin et la vaccination (cochez la case si la réponse est oui)».

Cette «information» fait référence aux feuillets qui accompagnent le formulaire. Or, il ne s'agit pas d'information, attendu que tous ces feuillets incitent à répondre «Oui» à la question qui suit: «et donne mon accord à la vaccination...» alors que l'information minimale que les parents sont en droit d'attendre est précisément le nom et la composition du vaccin, telle qu'elle figure dans le tableau ci-dessus, pour réellement décider en toute connaissance de cause quelles substances peuvent être inoculées à leurs enfants.

Enfin, en suivant l'évolution des cas de grippes relevés officiellement par le réseau Sentinelle, il ressort que certaines régions françaises, (voir par exemple les cartes de la région Poitou-Charentes pour les semaines 45 puis 46) sont sorties de la situation épidémique sans aucune campagne de vaccination systématique. Les récents communiqués de l'Organisation Mondiale de la Santé comme les données des services d'urgence français (Assistance publique - Hôpitaux de Paris) amènent à conclure que le pic de l'épidémie aurait déjà été atteint et que la baisse du nombre de cas se produit avant que les populations ne soient vaccinées.

En conséquence, et en considération de l'article 223-6 du code Pénal réprimant la non assistance à personne en danger, je demande:

A tous les parents de répondre «Non» au formulaire. A ceux qui souhaitent, malgré tout, faire vacciner leurs enfants, d'exiger un vaccin ne présentant pas les risques du Pandemrix.

Aux organisations représentatives des parents d'élèves de demander officiellement au Ministre de l'Éducation Nationale de sursoir à toute vaccination dans l'attente des investigations en cours sur les reactions allergiques graves constatées dans d'autres pays, ceci en application du principe de précaution inscrit dans la Constitution, de faire étudier les vaccins proposés par des experts réellement indépendants des fabricants, d'informer correctement les parents, notamment en faisant figurer la composition complète des vaccins sur les formulaires.

J'invite tous les parents d'élèves qui le souhaitent à co-signer et diffuser cette lettre.
Jean-Yves CREVEL

THE FLU CASE

French parents write Open Letter
advising against signing Swine Flu jab consent form

. The Flu Case, 27 November 2009, 11:17
https://web.archive.org/web/20100102021626/http://theflucase.com/index.php?option=com_content&view=article&id=2086%3Afrench-parents-write-open-letter-advising-against-signing-swine-flu-jab-consent-form-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

French parents have published an open letter giving facts and evidence to show that GlaxoSmith-Kline's Pandemrix swine flu jab is not adequately tested, and advising them not to sign "consent" forms for their children to be given the vaccine at school.

The open letter comes as the French government steps up its mass vaccination plans and parents around the country are receiving froms asking them to give their formal consent to kids to be given

the jab, a step that will prohibit them from claiming compensation from pharamceutical companies in the future for any damage caused by the jab.

The letter notes that parents have not been given adequate information by the government as to the potential side effects of the vaccine, and also that some regions in France have already announced the pandemic is over without a vaccination campaign.

The letter in French can be found here:
http://www.decapactu.com/spip/article.php3?id_article=499

"**Open letter to all parents of pupils and their representative associations**"

Today, 25 November 2009, we are being instructed by the national education authorities to fill out a form designed to allow vaccination of our children in schools, outside any standard framework.

Yesterday, we learned that the Canadian authorities noting along with the World Organization of Health an abnormal number of serious allergic reactions (including a fatal case) is about to make an emergency withdrawal of a batch of vaccines Arepanrix produced by the Laboratory GSK.

Reading the official documents intended to authorize the vaccines Arepanrix in Canada and Pandemrix in France, we note that, contrary to what has been stated too quickly, these two vaccines are identical, with only different names:
https://web.archive.org/web/20091229191059/http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832fr.pdf // (http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832fr.pdf)
http://www.hc-sc.gc.ca/dhp-mps/prodpharma/legislation/interimorders-arretesurgence/prodinfo-vaccin-fra.php

In addition, on 19 February 2009, the Advisory Committee for vaccines and biological products associates of the FDA (Food and Drug Administration, responsible to the United States of the evaluation and authorisation of medicines) met for a public hearing.

On this occasion, Dr Vaughn, representative of GSK, said: "while we have a great experience in matters of security profile for the classical inactivated vaccine against the seasonal influenza among children of more than six months, there is in general, very limited experience concerning the safety profile of the ASO3 among the child. » (AS03 designates squalene, which is in the French and Canadian GSK vaccine…)"

LE FIGARO

Cécilia Gabizon

Grippe A: les mineurs peuvent refuser l'injection

Le Figaro, 27 Novembre 2009, 08:17
https://sante.lefigaro.fr/actualite/2009/11/27/9915-grippe-mineurs-peuvent-refuser-linjection

*Selon le code de santé publique, le consentement d'un patient même mineur est nécessaire pour tout acte médica*l.

Ceux qui ont longuement mûri la décision de faire vacciner leurs enfants pourraient être déçus. Si, le matin, votre chérubin dit clairement «qu'il ne veut pas, il ne sera pas vacciné», a fait savoir le ministère de la Santé. Les premiers refus ont été observés alors que démarre la campagne de vaccination contre la grippe A (H1N1) dans les collèges et les lycées. Or, depuis la loi du 4 mars 2002 sur les droits des malades, le mineur a droit au respect de sa volonté. Au terme de l'article L. 1111-4 du Code de la santé publique, «le consentement du mineur doit être systématiquement recherché s'il est apte à exprimer sa volonté et à participer à la décision». Lorsqu'il dispose de la maturité suffisante, un mineur «peut donc refuser un traitement ou l'interrompre», explique le Dr Irène Kahn-Bensaude, pédiatre et conseiller de l'Ordre.

Ce n'est que dans les cas d'urgence, «si le refus risque d'entraîner des conséquences graves pour la santé de l'enfant, que la loi mais aussi l'article 43 du Code de déontologie disent clairement que le médecin doit passer outre», assure le Dr Michel Fillol, secrétaire général adjoint du Conseil national de l'ordre des médecins.

Procédure différenteen primaire

Dans le cas de la vaccination, «la volonté de l'enfant, dès lors qu'il peut l'exprimer clairement, prime sur celle des parents», estime Michèle Anahory, avocate, associée chez Price Waterhouse.

«C'est une dérogation aux dispositions sur l'autorité parentale», explique Me Marie-Anne Levitan, avocate spécialiste des questions de santé. Qui peut s'avérer problématique lorsque l'enfant est petit, car «la loi n'a pas fixé d'âge minimum pour donner son consentement». Au ministère de la Santé, on se veut pragmatique : «Il n'est pas possible de vacciner des adolescents contre leur gré.» En revanche, si les parents veulent absolument que leur progéniture soit protégée de la grippe A (H1N1), ils peuvent l'emmener plus tard, dans un centre de vaccination. En visite au collège Jules-Romains à Paris mercredi, Roselyne Bachelot a tenté de persuader les méfiants : «À ces jeunes qui doutent, je leur dirai que j'ai envie de les emmener dans un service de réanimation pour leur montrer un jeune avec les poumons complètement détruits par la grippe H1N1, ce qu'on ne voit pas avec la grippe saisonnière.»Dans ce collège, une deuxième journée de vaccination est déjà prévue, ce qui laissera du temps de réflexion aux parents encore indécis. Certains auraient rempli «non»au questionnaire, a fait savoir la principale Marie-Anne Krzesinski, mais «souhaiteraient finalement que leurs enfants soient vaccinés».

La ministre a rappelé que «lorsqu'un des deux parents s'oppose»à la vaccination, «c'est toujours le non qui l'emporte». Enfin, pour éviter peut-être que les enfants ne se dérobent à la piqûre, la procédure sera différente en primaire. Les petits devront se rendre accompagnés de leurs parents dans les centres de vaccination, le mois prochain.

The Telegraph

Mother taken to court for refusing to allow daughter to have swine flu vaccination

Telegraph, 28 November 2009, 8:00AM GMT

https://web.archive.org/web/20091201030639/http://www.telegraph.co.uk/health/healthnews/6671405/Mother-taken-to-court-for-refusing-to-allow-daughter-to-have-swine-flu-vaccination.html

A mother is being taken to court by her ex-partner for refusing to allow their daughter to have the swine flu vaccine.

The 44-year-old, a former international consultant, opted to take her daughter, 9, out of the immunisation programme run at her private school because she had reservations about the safety of the vaccine.

After spending hours researching it and speaking with friends in the medical profession, she decided that not enough was known about the long-term effects of the vaccine, and that her child, who has no medical problems, should not have it.

However, when news of her choice reached her former partner, 46, a financial consultant, he strongly disagreed.

He has now launched a civil action in the family court division of the Jersey Royal Court in the hope it will decide that the girl must be inoculated.

It is the first case of its kind and could set a precedent for future parental disputes over the vaccine.

Her mother told The Daily Telegraph: "I would die a million deaths for my little girl, I love her dearly and don't want to see any harm come to her, but I sincerely believe having this vaccination is not in her best interests. – "I have researched the vaccination extensively, the decision I have made is an informed one. I do not want my daughter to have it.

"My daughter is an extremely healthy child so I don't believe swine flu poses that much of a threat to her. A girl in her class had it, but the symptoms were not too bad, she just complained of a sore throat and feeling out of sorts.

"If she gets swine flu then she will build immunity naturally, and I will nurse her night and day until she is better.

"I am concerned about the long term impact of the vaccination. We were all told in the 1970s that thalidomide was safe for pregnant women, and look what happened."

The couple, who both live on Jersey, split acrimoniously over two years ago after a relationship of more than a decade.

They have since been embroiled in a separate legal dispute over the terms of a pre-nuptial-style contract they signed when she left her job to raise their daughter.

They cannot be named for legal reasons.

The mother said: "My former partner is adamant that he wants her to have the swine flu vaccine.

"I received an email from him saying he really wanted her to have the vaccine and I wrote back explaining my reasons and telling him it wasn't a decision I had taken lightly.

"The next thing I know, I received a letter telling me to attend court on Monday. His letter notified me of his application for a specific issue order, which I am told means our daughter could be made a ward of court and the judge could decide that she must have the injection.

"He knows I can't afford lawyers to fight him."

NHS figures show that under 16s are the age group most likely to be admitted to hospital with swine flu, while 21 per cent of deaths in England are among under-14s.

The Government says that trials of the swine flu vaccine have proved it to be as safe as the normal seasonal flu vaccine.

However, a poll of doctors for Pulse Magazine found that 49 per cent would refuse to have it, while a similar survey for GP magazine found 29 per cent would opt out, with 71 per cent stating safety fears as their reason why.

Most of the children at the girl's school have had the inoculation over the past two weeks after consent forms were sent home to parents.

Her mother said: "The fear of god has been struck into parents and children over swine flu, especially on this island, and I think it is totally out of proportion.

"She is aware of what is happening and she is aware of all the risks but she still does not want it. She knows that if she gets swine flu she will feel unwell.
"What are they going to do to make her have this? Hold her down?"

A legal source confirmed that the application has been lodged with the court and there will be a preliminary hearing on Monday.

He said: "The parents have split and there has been a lot of acrimony but I am not going to comment on what is going on there.

"The father genuinely thinks it is in his daughter's best interests to receive the immunisation. He would take the view that he would rely on what the medical authorities advise, rather than information collected from the internet where there is a lot of misinformation to be found.

"The court will consider what is best for the welfare of the child, and that is its only consideration."

The swine flu vaccine is not offered in schools in England and Wales, although it was recently announced that children aged between 6 months and five years will be invited to have the inoculation at their GP surgery.

However, in Jersey, all children from nursery age to 18 years old have been urged to have either the Pandenrix or Celvapan vaccination at their schools, under the guidance of the Medical Officer of Health, Dr Rosemary Geller.

A spokesman for the States of Jersey Department of Health and Social Services said: "We urge parents to have their children vaccinated but it is certainly not compulsory, parents have to sign a consent form.

"I understand our approach is different to England but that is because we are a very small island with a population of just 100,000 people. We have got through our high risk groups very quickly and have moved on to inoculate children because data suggests they are more susceptible.

"For that reason we have urged parents to consent to the vaccination because our hospital only has a limited capacity for intensive care patients."

The Health Protection Agency estimates there have been 760,000 cases of swine flu in England since the pandemic began and 163 deaths.

There have been 607 confirmed cases of swine flu in Jersey, and no deaths.

THE IRISH TIMES

Kitty Holland

Swine flu injections in schools from Monday

The Irish Times. 28 November 2009
https://www.irishtimes.com/news/swine-flu-injections-in-schools-from-monday-1.779997

The Swine flu vaccination programme will begin in schools on Monday, the HSE has confirmed.

A spokeswoman said larger schools would be visited first by vaccination teams "to get higher numbers done in the first batches".

The HSE has written to the first schools being targeted and others will be written to in coming weeks. All school staff will also be offered the vaccination.

The move marks the extension of the programme from at-risk groups, women who are more than 14 weeks pregnant and up to six weeks after birth, people over 65 and children aged between six months and five years.

By the time this phase of the programme is completed, some time early next year, everyone under the age of 18 and over six months will have been offered the vaccination.

The letters to schools will outline arrangements and vaccination packs will be provided to be sent home to parents with a consent form. Children over 16 will be able to sign their own consent forms.

A HSE spokeswoman said it would not be possible for teams to go into every individual school and in some instances a number of schools may be invited to bring their pupils to another school on the day vaccinations are being administered there.

In other cases pupils and staff will be advised to attend a HSE vaccination clinic and appointments for these children should be made by their parents or guardians.

Minister for Education Batt O'Keeffe has urged schools to co-operate, acknowledging that it will mean some disruption to school timetables.

Medical advice is that children under 13 will require two doses of the vaccine and that those 13 and over may need a second dose.

"The HSE is, therefore, initially focusing on vaccinating all children and arrangements for how the second dose will be given, to those that require it, will be advised by the HSE at a later date."

Separately, a number of parents of under-fives who have received HSE letters inviting them to bring their children for vaccination, have complained of being unable to access HSE clinics in the Dublin area.

One father of two said yesterday that the clinic he had been advised to attend, Cabinteely Health Centre, was fully booked.

A HSE spokeswoman advised parents to bring children to the local HSE clinic with their letter, adding "they won't be turned away".

Swine Flu Alert - Shocking Vaccine Miscarriage Horror Stories

MercolaCom, 28 November 2009
http://articles.mercola.com/sites/articles/archive/2009/11/28/Shocking-Swine-Flu-Vaccine-Miscarriage-Stories.aspx
https://archive.org/details/mercola-swine-flu-miscarriage

U.S. health authorities have made pregnant women one of the highest priority groups for getting the H1N1 swine flu vaccine, but is it actually safe for pregnant women and their babies?

In fact, the package inserts for the swine flu vaccines actually say that the safety of these vaccines for pregnant women has not been established. And miscarriage reports from pregnant women who have taken the H1N1 swine flu vaccine are starting to pour in from all over the nation.

The link below contains stories that will shock and anger you. If you are a pregnant mother, please do not take the H1N1 swine flu vaccine. Instead, do everything that you can do to avoid public places and make sure to wash your hands more than you usually would. Research the many great natural ways there are for fighting the flu.

Dr. Mercola's Comments (Facebook)

As a pro-safety drug- and vaccine advocate, I believe it's imperative to be able to unequivocally prove that a drug or vaccine will cause no harm, AND be able to show that it offers measurable benefit, before releasing it to market. This is especially important when we're dealing with pregnant women and young children.

Neither is true for the flu vaccine during pregnancy, and even less so for the H1N1 vaccine when given to pregnant women. Flu vaccine manufacturers clearly indicate that safety and effectiveness of their flu vaccines have not been established for pregnant women and nursing mothers.

Ditto for their H1N1 vaccines.

De Telegraaf

Onderzoek overlijden kinderen na griepprik

De Telegraaf, 2 December 2009, 11:39
https://web.archive.org/web/20120521210254/http://www.telegraaf.nl/grieplijn/5470303/__Onderzoek_overlijden_kinderen__.html?p=11,1

Den Bosch – Twee kinderen zijn overleden vlak nadat ze de inenting tegen de Mexicaanse griep hadden gekregen. Het centrum voor bijwerkingen Lareb heeft dat gemeld. In beide gevallen wordt nader onderzoek verricht, liet het centrum woensdag weten.

Eén kind had een ernstige hartafwijking en overleed vijf dagen na vaccinatie. "Er is geen aanwijzing voor een relatie met het vaccineren", stelt het centrum, dat het geval toch nader onderzoekt. Het tweede kind kreeg na de griepprik koorts. "Behalve koorts had het kind geen andere verschijnselen die wijzen op een relatie met het toedienen van het griepvaccin, maar er is ook geen duidelijke andere oorzaak voor het overlijden gevonden", stelt Lareb

THE FLU CASE

Two Children Die in the Netherlands after Swine Flu shot

The Flu Case, 3 December 2009, 11:13
https://web.archive.org/web/20100102021450/http://theflucase.com/index.php?option=com_content&view=article&id=2166%3Atwo-children-die-in-the-netherlands-after-swine-flu-shot&catid=1%3Alatest-news&Itemid=64&lang=en

Two children in The Netherlands died after getting the swine flu shot according to the newspaper, De Telegraaf.

One of the children had a severe heart disease and died 5 days after getting the shot.

The second child developped a fever after being vaccinated. The child appears to have had no underlying condition or sickness that could be attributed as the cause of death.

The authorities are dying a link between the shot and the deaths.

Le Télégramme

Grippe A. Quatre fois la dose de vaccin pour cinq enfants à Brest

Le Tèlègramme, 2 décembre 2009 à 00h00
https://www.letelegramme.fr/finistere/spangrippe-aspan-quatre-fois-la-dose-de-vaccin-pour-cinq-enfants-a-brest-707719.php

À la suite de l'erreur d'une infirmière, cinq enfants ont reçu quatre fois la dose de vaccin prescrite, lundi matin, au centre de vaccination de Brest. Les cinq petits allaient bien, hier, mais des parents ont passé une nuit blanche.

«Méthode à revoir»

«Mon fils de 22 mois a été vacciné, lundi matin, au centre de Brest et j'ai eu, en fin d'après-midi, un coup de fil d'un médecin de la Ddass m'informant qu'il avait reçu quatre fois la dose. Le médecin m'a conseillé de surveiller si mon enfant faisait une réaction à ce surdosage et m'a dit que les urgences pédiatriques du CHU étaient informées. Avec mon mari, nous n'avons pas dormi de la nuit pour rester auprès de lui. Le lendemain, je n'ai pas voulu courir aux urgences pédiatriques parce que mon fils allait bien, mais j'ai appelé le15, qui n'était pas au courant de l'incident. Le médecin régulateur aété très efficace. Je ne remets pas en cause le bien fondé du vaccin, mais la méthodologie: si mon médecin généraliste avait pu faire cette vaccination, il n'y aurait pas eu ce problème», explique une maman brestoise.

1ml au lieu de 0,25ml

Le conditionnement multidoses des vaccins est à l'origine du problème. Les cinq enfants ont reçu un millilitre de vaccin Panenzasans adjuvant, au lieu des 0,25ml recommandés jusqu'à 3ans. Ensuite et jusqu'à 9 ans, la dose est de 0,5ml comme pour une femme enceinte. «Ce n'est pas un problème d'organisation. Il s'agit d'une erreur isolée de manipulation, l'infirmière, pourtant expérimentée, qui a préparé l'injection s'est trompé de dosage. Le risque est de faire une réaction un peu plus forte au vaccin, avec de la fièvre. Mais aucun effet indésirable n'a été enregistré chez les cinq enfants que l'on continue à surveiller régulièrement. Le centre national a été informé ainsi que les experts de l'Afssaps», déclarait, hier soir, un médecin de la Ddass.

Grippe A: des enfants ont reçu 4 doses de vaccin au lieu d'1

Elle, 2 Decembre 2009
https://www.elle.fr/Societe/News/Grippe-A-des-enfants-ont-recu-4-doses-de-vaccin-au-lieu-d-1-1087787

Aujourd'hui, la Direction départementale des affaires sanitaires et sociales (Ddass) du Finistère a annoncé que cinq enfants, vaccinés lundi dans un centre de Brest, ont reçu par erreur, quatre doses chacun de vaccin au lieu d'une. Pour le moment, «aucun effet indésirable n'a été enregistré», mais «un suivi quotidien des enfants est assuré», a confié la Ddass. Par ailleurs, le centre de crise national et les experts de l'Agence Française de sécurité sanitaire des produits de santé ont été alertés. Le plus jeune des enfants est âgé de 22 mois. Comme les quatre autres, il a reçu une dose d'1 millilitre de vaccin au lieu des 0.25ml recommandé.

Interrogée par «Le Télégramme», la mère d'un des enfants a remis en cause «la méthodologie et non, le bien-fondé du vaccin». «Si mon médecin avait pu faire cette vaccination, il n'y aurait pas eu de problèmes», a-t-elle ajouté. K.M.

PARIS MATCH

Grippe: 5 enfants reçoivent un vaccin surdosé

Paris Match, 2 décembre 2009, 10:32
https://www.parismatch.com/Actu/Sante/Grippe-A-Vaccin-surdose-pour-5-enfants-167139

Cinq enfants ont reçu quatre fois la dose de vaccin prescrite, lundi matin au centre de vaccination de Brest après une erreur humaine, rapporte mercredi le *Télégramme*. Une infirmière leur a administré 1ml de Panenza au lieu des 0,25 recommandés pour les petits jusqu'à 3 ans.

"Ce n'est pas un problème d'organisation. Il s'agit d'une erreur isolée de manipulation. L'infirmière, pourtant expérimentée, qui a préparé l'injection, s'est trompée de dosage. Le risque est de faire une réaction un peu plus forte au vaccin, avec de la fièvre. Mais aucun effet indésirable n'a été enregistré chez les cinq enfants que l'on continue à surveiller régulièrement. Le centre national a été informé ainsi que les experts de l'Afssaps", a déclaré mardi soir, un médecin de la Ddass cité par le quotidien. Les cinq enfants vont bien.

Le Parisien

Grippe A: six enfants victimes d'une erreur de vaccination en Bretagne

Le Parisien, 2 décembre 2009 à 17h18
https://www.leparisien.fr/societe/sante/grippe-a-six-enfants-victimes-d-une-erreur-de-vaccination-en-bretagne-02-12-2009-730973.php

Six enfants ont été victimes d'erreurs de vaccination à Brest et Paimpol, a-t-on appris mercredi. Cinq d'entre eux, âgés de moins de trois ans, vaccinés lundi dans un centre de Brest, ont reçu par erreur quatre doses de vaccin chacun au lieu d'une contre la grippe H1N1. C'est ce qu'a indiqué mercredi la Direction départementale des affaires sanitaires et sociales (DDASS) du Finistère.

«Un suivi quotidien des enfants est assuré. A ce jour aucun effet indésirable n'a été enregistré», a expliqué la Ddass, qui évoque «une erreur isolée de manipulation» dans ce centre.

1 millilitre au lieu des 0,25 ml

Les cinq enfants, dont un âgé de 22 mois, ont reçu 1 millilitre de vaccin au lieu des 0,25 ml recommandé, poursuit la Ddass. Le centre de crise national a été prévenu, ainsi que les experts de l'Agence française de sécurité sanitaire des produits de santé. Il s'agit de flacons multidoses dans lequel on prélève une dose de 0,25 ml «Panenza non adjuvé», l'infirmière a prélevé 1 ml, il s'agit d'une faute isolée», a déclaré Dominique Le Goff, médecin inspecteur de santé publique de la Dass du Finistère. «L'infirmière ne se l'explique pas», a-t-elle ajouté.

«Après analyse avec l'équipe, nous avons conclu qu'il s'agit d'une erreur individuelle, nous n'avons pas été amenés à revoir l'organisation et la gestion de ce centre», a-t-elle aussi expliqué, en précisant que ce centre de vaccination «fonctionne bien». L'Afssaps s'est montrée «rassurante sur les risques». «Nous avons informé les familles pour une surveillance appropriée», a indiqué Anne Castot, chef du service de la gestion des risques des médicaments.

Le Monde

Vaccination contre la grippe H1N1:
quelques cas de surdose en Bretagne

Le Monde avec AFP, 3 Décembre 2009, à 08h06
https://www.lemonde.fr/epidemie-grippe-a/article/2009/12/03/vaccination-contre-la-grippe-h1n1-quelques-cas-de-surdose-en-bretagne_1275299_1225408.html

A Brest, cinq enfants de moins de 3 ans ont reçu 4 doses de vaccin chacun. A Paimpol, une fillette a reçu une dose "adulte". A Brest, aucun effet indésirable n'a été enregistré.

Cinq enfants de moins de 3 ans, vaccinés lundi dans un centre de Brest, ont reçu par erreur quatre doses de vaccin chacun contre la grippe H1N1, a indiqué mercredi la direction départementale des affaires sanitaires et sociales (Ddass) du Finistère. *"Un suivi quotidien des enfants est assuré. A ce jour aucun effet indésirable n'a été enregistré"*, a expliqué la Ddass, qui évoque *"une erreur isolée de manipulation"* dans ce centre.

Les cinq enfants, dont un âgé de 22 mois, ont reçu 1 millilitre de vaccin au lieu du 0,25 ml recommandé, poursuit la Ddass. Le centre de crise national a été prévenu, ainsi que les experts de l'Agence française de sécurité sanitaire des produits de santé (Afssaps). *"Il s'agit de flacons multidoses dans lequel on prélève une dose de 0,25 ml ("*Panenza non adjuvé*"), l'infirmière a prélevé 1 ml, il s'agit d'une faute isolée"*, a déclaré Dominique Le Goff, médecin inspecteur de santé publique de la Dass du Finistère. *"L'infirmière ne se l'explique pas"*, a-t-elle ajouté.

L'Afssaps s'est montrée *"rassurante sur les risques"*. *"Nous avons informé les familles pour une surveillance appropriée"*, a indiqué Anne Castot, chef du service de la gestion des risques des médicaments. *"Il nous semble que les risques d'une surdose sont essentiellement une hyperréaction locale, au point d'injection, voire un risque de fièvre ou un petit syndrome pseudo-grippal"*, a-t-elle indiqué. En outre, la responsable a relevé qu'à ce jour il n'y avait pas d'effet indésirable particulier qui ait été relevé. Or, d'après elle, s'il devait y avoir une réaction, *"ce serait à court terme"*.

Une des mères de famille, interrogée par le quotidien *Le Télégramme*, a dit ne pas remettre en cause *"le bien-fondé du vaccin, mais la méthodologie: si mon médecin généraliste avait pu faire cette vaccination, il n'y aurait pas eu ce problème"*. Par ailleurs à Paimpol, une fillette de 3 ans et demi a reçu lundi *"une dose adulte"* de vaccin au lieu d'une dose enfant, a indiqué la préfecture des Côtes-d'Armor. *"La petite fille a fait des poussées de fièvre en réaction, elle est surveillée par un pédiatre"*, a expliqué une porte-parole de la préfecture. *"Nous sommes en train d'analyser ce qui s'est passé"*, a-t-elle ajouté.

La France métropolitaine a enregistré près d'un million de nouveaux cas de grippe pandémique H1N1 la semaine dernière, selon les estimations du réseau des Grog (groupes régionaux d'observation de la grippe), diffusées mercredi. Près de 4 millions de personnes, précisément 3 824 000 personnes, ont déjà été infectées par le virus grippal pandémique H1N1 en France métropolitaine depuis le mois d'août, écrit-il. L'épidémie de grippe H1N1 2009 est *"toujours en hausse"*, note le réseau Grog, qui estime qu'il y a eu 993 000 cas de grippe en France métropolitaine la semaine dernière, contre 812 000 la semaine précédente. Cette *"activité épidémique en hausse"* est confirmée par les médecins du réseau Sentinelles-Inserm.

Grippe A: Cinq enfants reçoivent des surdoses de vaccin contre la grippe A

Le Point, Avec AFP, 3 décembre 2009, 07:18

La survaccination de cinq enfants de Brest n'aurait pas entraîné d'effets secondaires indésirables.

Cinq enfants vaccinés lundi dans un centre de Brest ont reçu par erreur quatre doses de vaccin chacun contre la grippe H1N1, a indiqué mercredi la Direction départementale des affaires sanitaires et sociales (DDASS) du Finistère dans un communiqué. "Un suivi quotidien des enfants est assuré. À ce jour, aucun effet indésirable n'a été enregistré", a expliqué la DDASS, qui évoque "une erreur isolée de manipulation" dans ce centre.

Les cinq enfants, dont un âgé de 22 mois, ont reçu 1 millilitre de vaccin au lieu des 0,25 ml recommandé, poursuit la DDASS. Le centre de crise national a été prévenu, ainsi que les experts de l'Agence française de sécurité sanitaire des produits de santé. Une des mères de famille, interrogée par le quotidien Le Télégramme, a dit ne pas remettre en cause "le bien-fondé du vaccin, mais la méthodologie: si mon médecin généraliste avait pu faire cette vaccination, il n'y aurait pas eu ce problème".

Seuls 10 % des collégiens et lycéens demandent à être vaccinés contre la grippe A

Le Point, 3 Decembre 2009, 14:38
https://web.archive.org/web/20100102013309/http://www.lepoint.fr/grippe-a-h1n1/2009-12-03/h1n1-seuls-10-des-collegiens-et-lyceens-demandent-a-etre-vaccines/2024/0/401117

Seuls quelque 10 % des élèves des collèges et lycées "demandent effectivement à être vaccinés" contre la grippe H1N1, une semaine après le lancement de la campagne de vaccination dans ces établissements, a indiqué jeudi le ministre de l'Éducation Luc Chatel. Mardi soir 1er décembre, une semaine après le début de la campagne, "nous étions à plus de 30.000 collégiens et lycéens vaccinés", a précisé le ministre lors d'un déplacement dans un lycée professionnel parisien accueillant des élèves sourds et malentendants.

"Dans les remontées de terrain que j'ai", a-t-il ajouté, "nous ne sommes qu'autour de 10 % des élèves dont les parents ont été sollicités qui demandent effectivement à être vaccinés". Face à ces chiffres, Luc Chatel a rappelé "l'importance pour les parents de solliciter la vaccination de leurs enfants". "Ce virus touche davantage les enfants, les personnes fragiles (...) La meilleure barrière, c'est la vaccination", a-t-il insisté.

Interrogé sur le cas d'une enseignante parisienne enceinte qui refuse de faire cours depuis plus d'une semaine en faisant valoir qu'elle risque d'attraper la grippe H1N1, Luc Chatel a indiqué que le ministère était "en train de regarder localement comment trouver une solution". "C'est une jeune femme vaccinée (contre la grippe H1N1, ndlr), mais qui se préoccupe de l'impact de la vaccination et de la propagation dans sa classe de la grippe A", a-t-il ajouté.

Le ministère de l'Éducation nationale avait souligné mardi qu'il s'agissait d'un cas particulier, et que la décision de l'enseignante était "illégale". Luc Chatel s'exprimait dans le cadre d'une visite du lycée professionnel François-Truffaut, qui accueille 13 sourds ou malentendants intégrés dans des classes classiques. Il a confirmé à cette occasion la création en 2010 d'un "capes en langue des signes" française (LSF), ouvert aux enseignants malentendants ou pas

Grippe: collégiens et lycéens rechignent à se faire vacciner

Les Echos, 4 Décember 2009 à 01:01
https://www.lesechos.fr/2009/12/grippe-collegiens-et-lyceens-rechignent-a-se-faire-vacciner-469527

Seuls quelque 10 % des élèves des collèges et lycées *«demandent effectivement à être vaccinés»* contre la grippe A (H1N1), a indiqué hier le ministre de l'Education, Luc Chatel. Au 1er décembre, une semaine après le début de la campagne dans les établissements, *«nous étions à plus de 30.000 collégiens et lycéens vaccinés»,* a-t-il précisé. Face à ces chiffres décevants, Luc Chatel a rappelé *«l'importance pour les parents de solliciter la vaccination de leurs enfants».*

L'épidémie, elle, gagne du terrain, avec près de 1 million de personnes (993.000) ayant consulté pour des infections liées au virus la semaine dernière. En une semaine également, 24 nouveaux décès ont été enregistrés et 481 personnes ont été hospitalisées. *« Cette hausse semble ralentir un peu»,* a toutefois déclaré la ministre de la Santé, Roselyne Bachelot, hier. Le nombre d'établissements scolaires complètement fermés a d'ailleurs été ramené à 190 hier, contre 219 mercredi.

Recrutements express

Les 1.080 centres de vaccination sont désormais tous ouverts. 1,33 million de Français ont été vaccinés en dix-huit jours. L'objectif gouvernemental est flou : le Premier ministre, François Fillon, avait indiqué qu'il s'agissait de vacciner 12 millions de Français dans les semaines qui viennent, Roselyne Bachelot affirmant dans « Le Monde » viser 30 millions d'ici à février.

Une chose est sûre, les 94 millions de doses de vaccins achetées ne seront pas nécessaires (une dose suffit pour les plus de 10 ans). Pour pallier l'engorgement persistant dans certains centres de vaccination, en particulier dans les grandes agglomérations (Paris, Lyon, Toulouse), le secrétaire d'Etat à l'Emploi, Laurent Wauquiez, a annoncé hier le recrutement express en contrats aidés spécifiques de 5.000 personnes. Les contrats d'une durée de six mois seront subventionnés à 100 % par l'Etat, et ils seront proposés par les associations (dont la Croix-Rouge) et les collectivités locales, afin d'aider à l'accueil dans les centres.

« Réquisitions intolérables »

La tension entre le gouvernement et les médecins libéraux reste vive. Le syndicat des médecins libéraux (SML) a dénoncé hier certaines *«réquisitions intolérables »*de praticiens, en région parisienne, car ne *«respectant pas les plages de disponibilités indiquées par les médecins volontaires».* Roselyne Bachelot, de son côté, a déclaré qu'elle *« ne voyait pas d'argument qui nous ferait revenir en arrière»* sur le choix de ne pas autoriser la vaccination dans les cabinets médicaux. *«La vaccination coûterait beaucoup plus cher en cabinet »,* affirme-t-elle.

Fick vaccinet – barnet dog

Aftonbladet, 5 December 2009
https://web.archive.org/web/20111116202636/http://www.aftonbladet.se/nyheter/article6240532.ab

Zahra 28: Allt var bra innan jag fick sprutan

Zahra Abdelkader, 28, var i nionde månaden. På vårdcentralen uppmanades hon att ta influensavaccinet.

Två dagar senare hade fostret dött.

– När barnet kom ut var han vacker. Perfekt. Men han andades inte, säger hon.

Zahra och hennes man Reshid, som bor utanför Umeå, var lyckliga. De väntade sitt första barn – en son. Han skulle heta Mohammed.

– Jag längtade så mycket efter att få höra mitt barn skratta och gråta, säger hon.

Övertalades

Förlossningen var beräknad till 24 november. Inuti magen kände hon regelbundet de starka sparkarna. Den 19 november gick hon på sin sista kontroll på vårdcentralen.

– Då såg allt bra ut. Jag fick höra barnets hjärta slå.

Zahra, som tidigare hade tackat nej till att vaccineras mot svininfluensan, övertygades att ta sprutan. Efteråt blev hon tung i kroppen, armen värkte.

– Två dagar senare kände jag att något var fel i magen. Barnet rörde sig inte.

Andades inte

Då, tre dagar före planerad nedkomst, åkte hon in till sjukhuset för att göra ett ultraljud. Då såg läkarna att barnet inte levde längre. Zahra tvingades föda fram sin döda son.

– Jag bara grät och skrek. Han vägde 4,5 kilo och hade alla fingrar, alla tår, alla organ. Men han andades inte. Jag tror att det var vaccinets fel att mitt barn dog. Innan jag fick sprutan var allt bra.

I går begravdes lilla Mohammed. Men Zahra orkade inte vara med. Hon har knappt sovit en blund den senaste veckan.

– Jag vet inte hur jag ska kunna leva med det här. Men jag måste berätta för att andra kvinnor inte ska behöva utsättas för samma sak. Jag vill att de utreder det här och ser till att det inte händer igen.

Fostret har obducerats och nu väntar Zahra och Reshid på besked.

Flera fall

Samtidigt har Umeå universitetssjukhus anmält händelsen till Läkemedelsverket.

– Vi har anmält eftersom det skett i anslutning till vaccineringen och för att vi velat uppmärksamma Läkemedelsverket på det här. Vi har tagit prover på fostret, men det kommer ta ett tag innan vi får svar. När vi får reda på alla fakta kommer vi att sätta oss ner och gå igenom resultaten i detalj, säger Ulf Segerberg, chefläkare vid Västerbottens läns landsting.

Läkemedelsverkets tror inte att vaccinet orsakat fostrets död.

– Vi har tidigare utrett fyra fall med kvinnor som anmält missfall efter vaccinering. Vi har tittat grundligt på varje fall och dragit slutsatsen att det inte har några samband med vaccinet, säger Ingemar Persson, senior expert vid enheten för läkemedelssäkerhet.

Fick inget stöd

Zahra, som är från Eritrea, har anmält händelsen till Antidiskrimineringsbyrån eftersom hon kände sig nonchalerad när hon fött fram det döda fostret.

– Hon fick ingen som helst hjälp. Ingen kurator, ingen taxi hem, säger Jabar Amin, verksamhetschef på Antidiskrimineringsbyrån.

THE FLU CASE

Abortion caused by "swine flu" vaccine in Sweden - again!

The Flu Case, 6 December 2009, 18:07

https://web.archive.org/web/20100102023634/http://theflucase.com/index.php?option=com_content&view=article&id=2194%3Aabortion-caused-by-qswine-fluq-vaccine-in-sweden-again&catid=41%3Ahighlighted-news&Itemid=105&lang=en

A woman in Sweden was pregnant in the ninth month when she was talked into taking the "swine flu" vaccine by doctors. Two days later she gave birth to a perfect but lifeless son.

"- I was longing so much to hear my child's laughter and cry", Zahra Abdelkader said.

She had been to recent check ups and everything was normal and the child was perfectly healthy. Zahra, who earlier had decided not to take the vaccine, was talked into it by staff at the local hospital where she had her check ups made.

"-Before I got the shot, everything was fine with my child. I don't know how I will be able to live with this but I have to share my experience so that other women will not be exposed to the same thing. I believe it was the vaccine that killed my baby."

Ingemar Persson, senior expert at the Swedish Medical Products Agency commented the horrible death in a statement: "- we have examined four cases earlier of women that have reported abortions after vaccination. we have looked very carefully on each case and concluded that it has nothing to do with the vaccine."

Sweden is the country with the highest number of vaccinated people. The trust in authorities is strong and media has effectively blocked out any criticism against the mass vaccination in an extraordinary propaganda campaign spanning all major news papers and TV-stations. Sweden is traditionally one of the most vaccine friendly nations where almost every child gets vaccinated at birth. The debate about vaccines and their dangers is ignored and gets very little attention by media.

Swedes are also susceptible to tricks played against them like "offering" something for free or to scare tactics and fake shortages. All these factors together with the massive media propaganda campaign and cover up is the reason why so many Swedes get the poisonous injections.

Svårt sjuk – trots vaccin

Aftonbladet, 11 December 2009
https://web.archive.org/web/20091215025408/http://www.aftonbladet.se/nyheter/svininfluensan/vaccinguiden/article6272787.ab

Douglas, 6, låg i respirator efter han fått svininfluensan

Douglas, 6, fick vaccinet. Tio dagar senare låg han i respirator. Svårt sjuk i svininfluensa.

Eftersom Douglas har astma och pälsdjursallergi var föräldrarna Marit Olofsson och Joakim Sandström noga med att han tidigt skulle få en spruta mot svininfluensan.

Den 29 oktober vaccinerades han.

På söndagskvällen tio dagar senare hemma i lägenheten i Östersund började han bli varm och hostig. Andningen blev allt tyngre. Familjen ringde sjukvårdsrådgivningen.

– De sa att ”det inte var något att oroa sig över”. När vi ringde vid tretiden igen sa de ”ge honom Alvedon”, berättar Joakim Sandström.

Hade lunginflammation

Men framåt morgonen hade sonen så svårt att andas att de åkte in till akuten på Östersunds sjukhus.

Där konstaterades lunginflammation.

Efter några timmar fick Douglas syrgas. Under natten förvärrades hans tillstånd.

– Han fick mer och mer svårt att andas. Han hade ångest och var väldigt rädd och orolig över att han inte fick luft, säger Joakim.

Douglas lades i respirator. Han fick Tamiflu och antibiotika, men inget hjälpte.

”Måste ge två sprutor”

Men efter två dygn vände det. På femte dagen kunde Douglas väckas upp.

I dag är han helt återställd.

– Läkarna säger att det vaccin han fick troligen hann ge effekt. Hade han inte fått det hade han nog blivit ännu sämre, säger Joakim Sandström.

Urban Tirén, verksamhetschef på Barnkliniken i Östersund:

– Erfarenheten talar för att man måste ge två sprutor till barn upp till och med tolv års ålder. Skyddet efter första vaccindosen byggs upp under flera veckor och blir ofta tillräckligt först efter den andra sprutan, säger han.

THE FLU CASE

Did Boy in Sweden Get Virulent Swine Flu From Vaccine?

The Flu Case, 14 December 2009, 13:36
https://web.archive.org/web/20100102034105/http://theflucase.com/index.php?option=com_content&view=article&id=2279%3Adid-boy-in-sweden-get-virulent-swine-flu-from-vaccine&catid=1%3Alatest-news&Itemid=64&lang=en

A boy in Sweden has had to be put onto a respirator suffering from severe lung damage associated with the virulent form of the swine flu six, according to the Swedish newspaper Aftonbladet.

The doctors are maintaining that the boy developed the lung damage six days after he got the jab in spite of the vaccine. But the timing raises the question of whether the vaccine did not cause the sickness.

REUTERS

Mort d'un enfant après une vaccination contre la grippe A

Reuters, 12 December 2009, 7:57 PM GMT+8
https://www.reuters.com/article/idUSPAE5BB02R/

Paris (Reuters) – Un enfant de neuf ans est mort mardi, quatre jours après avoir été vacciné contre la grippe A(H1N1), déclare samedi l'Agence française de sécurité sanitaire des produits de santé (Afssaps).

"Les éléments disponibles à ce jour ne permettent pas d'établir l'origine du décès", ni un lien éventuel avec la vaccination, écrit l'Afssaps dans un communiqué.

Une autopsie a été pratiquée jeudi à la demande du parquet du Puy-en-Velay (Haute-Loire), poursuit l'agence, ainsi que des analyses virologiques et bactériennes, dont les résultats ne sont pas encore disponibles.

L'enfant a été vacciné le 4 décembre avec le Panenza, vaccin sans adjuvant produit par Sanofi-Pasteur. La France a commandé 28 millions de doses au laboratoire.

Selon l'Afssaps, l'enfant a présenté "48 heures après la vaccination de la fièvre et des troubles digestifs importants". Il a été victime d'un "malaise sévère", mardi, et il est décédé deux heures après sa prise en charge par le Samu.

Au 11 décembre, l'épidémie de grippe A a causé 139 décès, selon le bulletin de l'Institut de veille sanitaire.

Près de quatre millions de personnes ont été infectées depuis début août et plus de 2,5 millions ont été vaccinées.

Selon la ministre de la Santé Roselyne Bachelot, l'épidémie est en phase de stabilisation mais la campagne de vaccination s'accélère dans tout le pays, où 834 centres sont ouverts ce samedi, soit 69 de plus que samedi dernier.

Dimanche, ce sont 229 centres de vaccination qui devraient accueillir le public sur tout le territoire, un nombre également en hausse, a annoncé le ministère de l'Intérieur.

leParisien.fr

Grippe A : enquête après le décès d'un enfant vacciné

le Parisien, 12 décembre 2009 à 07h00

https://www.leparisien.fr/societe/grippe-a-enquete-apres-le-deces-d-un-enfant-vaccine-12-12-2009-741894.php

Faut-il attribuer au vaccin contre la grippe A la mort d'un enfant de 9 ans, mardi en Haute-Loire ? C'est la question à laquelle devra répondre le parquet du Puy-en-Velay. La justice a indiqué hier avoir ouvert une enquête pour déterminer les raisons du décès de ce garçon à la santé fragile, qui avait été vacciné quelques jours auparavant contre le virus H1N1.

Le jour de sa vaccination, le 4 décembre, et le lendemain, l'enfant s'est senti fatigué, fiévreux et s'est plaint de maux de tête. De nouveau fébrile et victime de diarrhées le lundi 5 décembre, il a finalement été transféré à l'hôpital le mardi, où il est décédé à la suite d'un arrêt cardio-vasculaire. N'identifiant pas de cause évidente à ce décès, le médecin a prévenu les autorités hospitalières qui ont alerté la justice. L'enquête, ouverte mercredi, a été confiée à la police judiciaire afin d'établir les causes de la mort et un éventuel lien avec le vaccin. L'autopsie, qui s'est déroulée jeudi à Saint-Etienne (Loire), n'a pas permis d'établir ce lien ni de l'écarter. Des prélèvements ont été effectués et seront analysés dans les jours à venir. « Il semble y avoir eu de petites complications après le vaccin, mais aucune conclusion ne peut être tirée pour l'instant », a déclaré le procureur.

«Rien ne permet pour l'heure de faire un lien avec le vaccin »

«Cet enfant avait des antécédents infectieux importants et avait été hospitalisé plusieurs fois pour des pneumopathies, mais rien ne permet pour l'heure de faire un lien avec le vaccin », estime-t-on à l'Agence française de sécurité sanitaire des produits de santé (Afssaps). Depuis le début de la campagne de vaccination, 33 cas graves potentiellement imputables au vaccin et s'étant traduits par une hospitalisation ont été signalés à l'Afssaps: des cas de paralysies faciales, d'oedèmes, de convulsions, de fourmillements au niveau des membres.

Mi-novembre, une jeune femme sans antécédents avait perdu son foetus de 38 semaines deux jours après avoir été vaccinée. Après examen, la présence du virus H1N1 a été détectée dans les tissus du foetus. «La mère portait probablement déjà en elle le virus et son bébé est mort de la grippe, pas du vaccin», estime le professeur Jean-Philippe Derenne, chef de service pneumologie et réanimation à la Pitié-Salpêtrière (Paris XIII e). «Le vaccin n'est pas un produit infectieux, insiste de son côté Jean Marimbert, le directeur général de l'Afssaps. La souche virale utilisée a été tuée et ne peut donc pas contaminer. Elle ne sert qu'à provoquer des anticorps.»

«Un vaccin est un outil thérapeutique et tous les outils thérapeutiques peuvent présenter un risque, mais, à ma connaissance, il n'y a pas eu de décès rapporté à ce jour à la suite d'une vaccination contre le H1N1, ajoute Jean-Philippe Derenne. Quinze millions de personnes ont été vaccinées en Europe et cela a clairement permis d'éviter un grand nombre de décès dus à la grippe A.» Dans l'Hexagone, d'ici à dimanche, 3,5 millions de personnes au total auront été vaccinées. La France est actuellement le seul pays d'Europe où l'épidémie progresse.

French Prosecutors to Investigate death of boy after Swine Flu jab

The Flu Case, 14 December 2009.

https://web.archive.org/web/20100102031718/http://theflucase.com/index.php?option=com_content&view=article&id=2277%3Afrench-prosecutors-to-investigate-death-of-boy-after-swine-flu-jab&catid=1%3Alatest-news&Itemid=64&lang=en

The prosecutor's office in Puy-en-Velay, Haute Loire, France, is to investigate the death of a 9-year-old boy four days after being given the swin flu jab, reports Le Parisien.

The boy died in hospital of a cardiac arrest just a few days after getting the jab.

According to media reports, the boy was given Panenza vaccine produced by Sanofi.

MailOnline

Children to get just half dose of swine flu vaccine

Daily Mail, 13th December 2009, 2:11 AM
http://www.dailymail.co.uk/news/article-1235444/Children-just-half-dose-swine-flu-vaccine.html

Children receiving the swine flu vaccination will now be given only half the original dosage in a single shot after fears it could cause a high fever.

The Government had previously recommended two separate 0.25ml doses of the Pandemrix vaccine, given three weeks apart.

But after warnings from the European medicines watchdog that the second dose could cause fevers of up to 38C (100F), the Government now recommends one 0.25ml dose for children under ten.

It is half the amount given to adults and older children but still enough to provide immunity.

Children with weakened immune systems will continue to get two doses of 0.25ml each.

The updated safety advice was disclosed days after the start of the second wave of the Government's swine flu vaccination programme.

It aims to inoculate three million children aged between six months and five years – the group deemed most at risk of needing hospital treatment.

Meanwhile, the medicines watchdog, the Medicines and Healthcare products Regulatory Agency (MHRA), reported four people had died after receiving the Pandemrix vaccine, although all had serious underlying health conditions and the deaths are not being linked to the jab.

One baby died in the womb three weeks after its mother was given the jab and five women miscarried, although the incidents are being described as 'coincidental'.

One person developed the paralysis condition Guillain-Barre Syndrome which was linked to a swine flu jab given in America in the Seventies.

The MHRA had received 1,506 reports of minor adverse reactions to Pandemrix such as swelling at the site of injection, nausea or 'flu-like' illness.

The Joint Committee on Vaccination and Immunisation, which recommended the dosage change, said that children could be given paracetamol if they developed a fever after vaccination. The Department of Health said that the vaccine remained safe.

AFTONBLADET

Fick hjärnblödning efter vaccineringen

Aftonbladet, 13 December 2009.
https://www.aftonbladet.se/nyheter/a/XwoyOo/fick-hjarnblodning-efter-vaccineringen

Anna, 37, var höggravid när hon vaccinerades mot svininfluensan.

Sex dagar senare fick hon en hjärnblödning.

– Det har varit totalkaos, säger hennes sambo.

Anna var gravid i vecka 33 när hon hämtades av ambulans i hemmet i Göteborg den 23 november. Då var hon vaken men inte kontaktbar.

– Hon var uppe och gick vid fyratiden på morgonen. Jag hörde hur hon ramlade omkull på vardagsrumsgolvet. Jag sprang dit och drog upp henne i soffan och försökte prata med henne, men hon bara kräktes, säger sambon.

Akut kejsarsnitt

På Sahlgrenska sjukhuset kunde läkarna konstatera att Anna drabbats av en massiv hjärnblödning. Och det var bråttom.

Barnet, en son, förlöstes med akut kejsarsnitt och Anna fördes till neurointensiven.

– Sen dess har det varit totalkaos. Man sover inte på nätterna, och så undrar man vad som hänt, säger sambon.

Kvar på Sahlgrenska

Sonen fördes till sjukhuset i Mölndal där han än i dag vårdas eftersom han föddes sju veckor tidigt.

Anna är kvar på Sahlgrenska. Hennes sambo har pendlat mellan hemmet och de båda sjukhusen i tre veckor.

– Man försöker hålla sig levande. Bryter jag ihop kan jag inte ta hand om vare sig min sambo eller mitt barn.

Tre–fyra dagar efter vaccineringen insjuknade Anna i influensaliknande symptom. Sedan kom hjärnblödningen – men läkarna kan inte förklara varför.

Ska utredas

– Hon hade en underbar graviditet. Innan det här hade hon mått illa en enda dag. Inget högt blodtryck, inga biverkningar, ingenting, säger sambon.

Professor Jan Liliemark vid Läkemedelsverket har inte hört talas om hjärnblödning som biverkning av vaccinet tidigare.

– Det är väldigt tråkigt att sånt här inträffar. Men det är för tidigt att säga om det har något samband med vaccinet eller inte. Vi får titta på rapporten och utreda det.

Fotnot: Anna heter egentligen något annat.

Pregnant woman gets brain damage from "swine flu" shot

The Flu Case, 13 December 2009

https://web.archive.org/web/20100102013113/http://theflucase.com/index.php?option=com_content&view=article&id=2255%3Apregnant-women-gets-brain-damage-from-qswine-fluq-shot&catid=1%3Alatest-news&Itemid=64&lang=en

A 37-year old woman in Gothenburg Sweden had a perfect pregnancy without any complications. Eight weeks before the expected birth, she had the poisonous Pandemrix "swine flu" shot and after a few days she fell ill with influenza like symptoms.

Her husband shares how he found her on the floor early one morning: "- She was up around four o'clock in the morning and I heard how she fell to the floor in the living room. I ran there and pulled her onto the sofa and tried to communicate with her but all she did was throwing up."

At the hospital, doctors found she suffered from massive haemorrhage to the brain and decided to immediately take the baby out.

For three weeks, her man has been living in total chaos, rushing between the two different hospitals - one where his son is treated for the early birth and the other where his woman is treated for the massive haemorrhage to her brain.

And again: "It is too early to say if this had anything to do with the vaccination. We will have to analyse the report and investigate." says professor Jan Liliemark at the Swedish Medical Products Agency.

The Atlanta Journal-Constitution

Ga. got 43,000 doses of recalled swine flu vaccine

The Atlanta Journal-Constitution, 15 December 2009, 7:05 p.m.
https://web.archive.org/web/20091220041038/http://www.ajc.com/health/ga-got-43-000-242141.html?cxntlid=daylf_artr

Georgia received more than 43,000 doses of pediatric swine flu vaccine that have been recalled because they have lost some of their potency, state health officials said Tuesday.

Federal health officials emphasized that the recall is not based on safety concerns, but rather the loss in potency of the pre-filled syringes for infants ages 6 to 35 months.

Some 800,000 doses of the vaccine produced by the pharmaceutical company Sanofi Pasteur have been recalled in the United States.
"There are no safety concerns with these lots," said the Centers for Disease Control and Prevention.

Joye Burton, a spokesman for the Georgia Department of Community Health, said 115 providers received 43,630 doses via direct shipment. Those providers are being contacted by phone.
Len Lavenda, a spokesman for Sanofi Pasteur, said the doses had lost about 12 percent of their potency. Children who received one of the recalled doses do not need to receive a substitute shot, officials said.

Children within that age group were already supposed to receive two shots. If both shots have already been given, the children should be adequately protected against the virus, officials said.

Beyond that, parents of children who received the recalled vaccine do not need to take any other medical action, health officials said.
"In reality, parents should continue doing what they planned to do," Lavenda said. "We think the vaccine is safe. ... There is nothing to be worried about."

Health officials in Fulton, Gwinnett and Clayton said they had not distributed any of the recalled doses at their county-operated health clinics. But officials said they could not speak for the doctors, drugstores and other private health providers in their counties.

At least one Georgia health district had received the recalled doses.
Dave Palmer, a spokesman for District 2 Public Health, which covers 13 counties in North Georgia, said that initial shipments went to private providers.

Those providers, he said, received more than they needed and gave the rest to public health departments.
"We've asked everyone to hold on to the vaccine and then return it when asked to do so," Palmer said.

Lavenda, the company spokesman, said the vaccine had gone through rigorous testing along the way for such things as safety and potency.

The vaccine lots passed all quality controls and met all specifications required by the government agencies at the time of shipping, said a statement by Sanofi Pasteur. The vaccine was first shipped on Sept. 29. Later testing showed a drop in potency.

On Dec. 7, Sanofi Pasteur notified federal health officials that the potency in one batch of pediatric syringes was found to have dropped below the specified limit, according to the CDC.

As a result of this finding, Sanofi Pasteur tested additional lots and found that three other batches measured below the limits.

Sanofi Pasteur is asking that all unused doses be returned.

Unlike the seasonal flu, swine flu has hit young people hard. Young people, their caregivers, people with other health issues and pregnant women are among the target groups urged by the CDC to get the vaccine as soon as it is available.

Dr. Margaret Lewin, a vaccine specialist and medical director for Cinergy Health, said vaccine recalls are rare.

"I really would not panic," she said. "They're not talking about things that affect the safety of the vaccine. They're talking about a slight decrease in potency. The fact that they found something on routine screening makes me very comfortable that they are really monitoring this closely. I'm actually reassured by it."

Q. Is the recalled swine flu vaccine safe?

A. Yes, federal health officials say. These recalled doses passed tests for safety but have lost a bit of their potency since leaving the manufacturer.

Q. What do I do now?

A. There is no need to readminister a dose to those who have received the vaccine. However, all children less than 10 years old should get two doses of swine flu vaccine approximately a month apart for the optimal immune response. Therefore, children less than 10 years old who have only received one dose of vaccine thus far should still receive a second dose.

Beyond that, parents of children who received vaccine from the recalled lots do not need to take any action.

Sanofi Recalls 800,000 Swine Flu Shots on Potency (Update1)

Bloomberg, 15 December 2009, 11:15 EST
https://web.archive.org/web/20111222015259/http://www.bloomberg.com/apps/news?pid=newsarchive&sid=azlsIBRuqG0Q

Dec. 15 (Bloomberg) – Sanofi – Aventis SA recalled 800,000 doses of swine flu vaccine after testing showed the potency of the batches was too low, the U.S. Centers for Disease Control and Prevention said in a statement today.

Doctors who have unused shots from the batches should return them, the CDC said today. The shots remain safe, and people who have already been inoculated don't need to get revaccinated, according to the Atlanta-based agency.

The shots passed potency tests when they first shipped, and their potency dropped in subsequent tests by 10 to 12 percent, said Anne Schuchat, head of the National Center for Immunization and Respiratory Diseases at the CDC, in a telephone interview.

The recalled shots are preservative-free syringes of a low- dose version made for children ages 6 months through 25 months, she said. There are no remaining preservative-free shots available for children under 2 years old. The preservative, called thimerosal, has been shown repeatedly in studies to be safe, though some parents are wary of it, Schuchat said.

Sanofi said it began delivering swine flu vaccine in the U.S. in September, with the bulk of deliveries expected in the fourth quarter.

Sanofi's vaccine sales totaled 1.05 billion euros ($1.5 billion) in the third quarter, including 78 million euros from H1N1 influenza shots. In October, the Paris-based company forecast that sales of H1N1 vaccine would surge to about $500 million in the fourth quarter. The company plans a seminar Dec. 17 to brief investors and analysts on the vaccine business.

Swine flu infected 50 million people in the U.S. and killed an estimated 10,000 through Nov. 14 from the start of the pandemic in April, the CDC said on Dec. 10. Swine flu, known as H1N1, was first identified in April and swept the globe at an unprecedented rate before cases declined in the U.S. in the past few weeks. In a typical season, 36,000 people die of the flu.

Kids' Swine Flu Shots Recalled; Not Strong Enough:
800,000 doses of children's swine flu vaccine recalled; potency dipped below required levels

ABC News, 15 December 2009
https://web.archive.org/web/20091218052242/https://abcnews.go.com/Health/SwineFluNews/wireStory?id=9341242
https://www.timesunion.com/news/article/Thousands-of-kids-H1N1-shots-recalled-556339.php
https://abc7ny.com/archive/7172519/

Hundreds of thousands of swine flu shots for children have been recalled because tests indicate the vaccine doses lost some strength, government health officials said Tuesday.

The shots, made by Sanofi Pasteur, were distributed across the country last month and most have already been used, according to the Centers for Disease Control and Prevention. The 800,000 pre-filled syringes that were recalled are for young children, ages 6 months to nearly 3 years.

Dr. Anne Schuchat, a CDC flu expert, stressed that parents don't need to do anything or to worry if their child got one – or even two – of the recalled shots. The vaccine is safe and effective, she said.

The issue is the vaccine's strength. Tests done before the shots were shipped showed that the vaccines were strong enough. But tests done weeks later indicated the strength had fallen slightly below required levels.

Why the potency dropped isn't clear. "That's the $64,000 question," said Len Lavenda, a Sanofi Pasteur spokesman.

Young children are supposed to get two doses, spaced about a month apart. Health officials don't think children need to get vaccinated again, even if they got two doses from the recalled lots, said Schuchat.

Swine flu vaccine has been available since early October, and since then manufacturers have released about 95 million doses for distribution in the United States.

The recalled shots were made by Sanofi Pasteur, the vaccines division of France-based Sanofi-Aventis Group. The vaccine all tested fine when it was shipped out earlier this fall. But last week, testing of one lot showed that the potency had fallen about 12 percent below the government standard, Lavenda said.

The company found three other lots with diminished strength. It notified government health officials and did a voluntary recall, asking doctors to return any unused doses. The vaccine has been in high demand and the company doesn't expect to see much come back, Lavenda added.

Officials with the Food and Drug Administration, the CDC and the company all said they believe the strength of the recalled doses is still high enough to protect children against the virus. No potency problem has been detected in the same vaccine packaged in other types of syringes or vials, Lavenda said.

Experts have a theory that the problem is specific to the children's pre-filled syringes. For some reason, the antigen - the key vaccine ingredient - may be sticking to the walls of those syringes, said Dr. Jesse Goodman, the FDA's deputy commissioner for science and public health.

Another manufacturer, Novartis, in February recalled five lots of seasonal flu vaccine packed in pre-filled syringes under similar circumstances.

Sanofi Pasteur bills itself as the No. 1 manufacturer of flu vaccines in the world. It makes flu vaccine at sites in France and in Pennsylvania.

Swine flu was first identified in April. During the first seven months of the pandemic, it has sickened about 50 million Americans and killed about 10,000, according to CDC estimates.

CNBC

800,000 Doses of Swine Flu Vaccine Recalled

CNBC, 15 December 2009, 11:18 AM EST
https://www.cnbc.com/2009/12/15/800000-doses-of-swine-flu-vaccine-recalled.html

Health officials are recalling hundreds of thousands of doses of swine flu vaccine after tests indicated they may not be potent enough to protect against the virus.

The Centers for Disease Control and Prevention notified doctors about the recall Tuesday.

The recall involves about 800,000 doses made by Sanofi Pasteur. The doses are pre-filled syringes intended for young children, ages 6 months to almost three years.

Health officials recommend children those ages get two doses, spaced about a month apart.

Health officials say it’s not clear how many doses have already been given, but they don’t think children need to be re-vaccinated.

The lots passed potency tests when they were first shipped, but tests indicate the potency waned after.

Nearly 1 million H1N1 vaccines have been recalled

Russia Today, Dailymotion, 15 December 2009.
https://www.dailymotion.com/video/xun0h4

10,000 Americans have died from swine flu since April, but many experts say that this pandemic is not as deadly as the normal flu, so what's all the hype about? Swine flu vaccines are now being made available to most Americans, but many have chosen not to take it. The latest news that 800,000 vaccines were recalled hasn't helped ease Americans fears about the vaccine

Health & Human Services

Michigan Receives 17,200 Doses of Recalled H1N1 Vaccine

Michigan.Gov, 15 December 2009
https://www.michigan.gov/mdhhs/inside-mdhhs/newsroom/2009/12/15/michigan-receives-17200-doses-of-recalled-h1n1-vaccine

Lansing – Sanofi-Aventis SA, the maker of the H1N1 vaccine, is recalling about 800,000 doses of the pediatric H1N1 vaccine because tests found the potency was too weak to effectively protect against the virus. Michigan has received about 17,200 doses of the vaccine, which is for children aged six months to three years old.

Health departments, clinics or private doctors' offices within the City of Detroit or within 38 Michigan counties received the recalled doses. The counties include: Allegan, Alpena, Bay, Berrien, Cass, Cheboygan, Crawford, Delta, Emmet, Grand Traverse, Genesee, Ingham, Isabella, Jackson, Kalamazoo, Kalkaska, Kent, Lake, Lapeer, Leelanau, Livingston, Mackinac, Macomb, Manistee, Mason, Mecosta, Menominee, Monroe, Newaygo, Oakland, Otsego, Saginaw, Schoolcraft, St. Clair, Van Buren, Washtenaw, Wayne and Wexford.

While the antigen content of these doses is now below the specification limit for the product, the Centers for Disease Control and Prevention and the Federal Drug Administration are in agreement that the small decrease in potency is unlikely to result in a clinically significant reduction in immune response among persons who have received the vaccine. For this reason, there is no need to revaccinate persons who have received vaccine from these lots.

Providers are being asked to return any vaccine that remains unused to the manufacturer from the specified lots. The CDC also notes the following:

- There are no safety concerns with these recalled lots of 2009 H1N1 vaccine. All doses successfully passed pre-release testing for purity, potency and safety.
- Only specified batches of the 2009 H1N1 pediatric vaccine for children 6 months to 3 years old in pre-filled syringes are affected.
- There is no need to re-administer a dose to those who received vaccine from these batches. The vaccine potency is only slightly below the "specified" range. The vaccine in these batches is still expected to be effective in stimulating a protective response despite this slight reduction in the concentration of antigen.
- All children less than 10 years old should get the recommended two doses of H1N1 vaccine approximately a month apart for the optimal immune response. Therefore, children less than 10 years old who have only received one dose of vaccine thus far should still receive a second dose of 2009 H1N1 vaccine.
- Parents of children who received vaccine from the recalled batch do not need to take any action, other than to complete the two-dose immunization series if not already completed.
- Children should receive both doses of 2009 H1N1 vaccine from the same type of vaccine (i.e., both doses as inactivated, injectable; or both doses as live, attenuated, nasal spray vaccine).
- All vaccines are routinely tested for purity, potency and safety prior to release. The four batches of vaccine met all required specifications at the time of release and shipment to distribution centers. The vaccine provided in multi-dose vials and the single-dose, 0.5 mL pre-filled syringes for persons 36 months and older continues to meet all specifications.

The Michigan Department of Community Health (MDCH) encourages residents to get the H1N1 vaccine as it is available to everyone in the state. In addition to being vaccinated, Michigan residents can help stop the spread of the virus by washing hands thoroughly and often; covering mouths when sneezing or coughing; and staying home from work or school if sick.

Todd Neale, Dan Childs

Manufacturer Recalls 800,000 Doses of H1N1 Vaccine: Flu Experts Not Worried
A massive recall of H1N1 vaccine does not suggest a health threat, experts say

ABC News, 16 December 2009, 7:57 AM
https://abcnews.go.com/Health/SwineFluNews/sanofi-pasteur-recalls-800000-doses-h1n1-vaccine/story?id=9347146

Dec. 15, 2009. – No big deal. That's what infectious disease experts are saying about drugmaker Sanofi Pasteur's recall of about 800,000 pediatric doses of its vaccine against pandemic H1N1 influenza because of low potency. The recall was announced by the U.S. Centers for Disease Control and Prevention on Tuesday.

"It is a pain the neck, but not a major crisis," said Dr. William Schaffner, chair of Vanderbilt University School of Medicine's Department of Preventive Medicine in Nashville, Tenn. "This should not discourage people from being vaccinated."

But the recall is hardly a shot in the arm for a swine flu vaccination effort that has in recent months been plagued by delays and supply shortages.

"I suspect most of the consequences will be perceptual," said Stephen Morse, professor in the Department of Epidemiology at the Columbia University Mailman School of Public Health in New York."But it does add to the embarrassment in a program whose glitches have already been well publicized."

Despite the nature of the recall, children who were vaccinated with the weakened doses should not be revaccinated because the antigen content "is only slightly below the 'specified' range," according to the CDC. In other words, even the weakened level of the vaccine is still expected to be protective.

The recall does not affect any of the vaccine for adults or products from other manufacturers. And according to the CDC, "There are no safety concerns with these lots of H1N1 vaccine. All lots successfully passed pre-release testing for purity, potency, and safety." The strength of vaccines can sometimes decline with time, the agency said in a statement on its Web site.

The weakened potency of the vaccine doses was identified by Sanofi Pasteur during routine quality assurance testing, but the company has not yet determined the cause. Representatives from the company were not immediately available for comment.

Recall Does Not Mean H1N1 Vaccine Unsafe, Experts Say

Most immunization experts agreed that the recall should not be viewed as a black eye for the H1N1 vaccine.

"When there will be over 150 million doses available in the U.S. alone, we should be happy that testing is vigorous and found very little problem thus far," said Dr. Peter Katona, associate professor of Clinical Medicine at the David Geffen School of Medicine at UCLA. "The fact that revaccination isn't even recommended makes this even less of an issue."

Dr. John Treanor, chief of the Infectious Diseases Division of the Department of Medicine at the University of Rochester Medical Center in Rochester, N.Y., noted that the 10 percent drop in potency that has been reported would mean that instead of getting a dose of 15 micrograms from the H1N1 shot, a person would be getting a dose of 13.5 micrograms.

"In studies that we and others have done with seasonal vaccine in adults, there is no substantial difference in the immune response between a dose of 15 micrograms and one of 7.5 micrograms," he said. "So I can't imagine that the effect of a 10 percent decrease in potency of this vaccine would be even noticeable."

Los Angeles Times

Thomas H. Maugh II

800,000 doses of swine flu vaccine recalled

Los Angeles Times, 16 December 2009, 12 AM PT
https://www.latimes.com/archives/la-xpm-2009-dec-16-la-sci-swine-flu-vaccine16-2009dec16-story.html

Vaccine manufacturer Sanofi-Aventis is recalling 800,000 doses of H1N1 vaccine meant for children younger than 3 because the influenza vaccine has lost potency since it was shipped from the factory.

"This is non-safety-related, but is part of a routine quality assurance program," Dr. Anne Schuchat, director of the Centers for Disease Control and Prevention's National Center for Immunization and Respiratory Diseases, said in a telephone interview Tuesday.

There are now 94.6 million doses of vaccine available, "so this is not as big a deal as it might have been earlier," she said.

She emphasized that "there are no safety concerns."

The doses in the recall are pre-filled syringes containing thimerosal-free vaccine made specifically for children ages 6 months to 35 months.

At the time of the vaccine's manufacture, testing showed that the doses contained the recommended 7.5 micrograms of antigen, the virus component that is used to stimulate immunity.

But later testing of one lot of the vaccine showed that some of the antigen had apparently degraded slightly, leaving the vaccine less potent than desired.

Follow-up tests identified three other lots with the problem, bringing the total to four lots comprising 800,000 doses. It is not highly unusual for stored vaccines to undergo some degradation, but it is not yet known why that happened in this case, Schuchat said. It doesn't appear to be a storage issue.

Sanofi is one of five vaccine manufacturers whose products are approved in the United States. All of them routinely check their products for potency at regular intervals; none of the others have reported problems.

Children who received the vaccine do not need to be re-immunized, Schuchat said, because they probably received a sufficient dose, "but we wanted to make sure that doses that weren't already given won't be."

She emphasized that children who have received only one dose of vaccine should get their scheduled second dose. Two doses are required to provoke full immunity in children younger than 10, as is the case with seasonal flu vaccine.

In adults and teens who have received flu vaccinations in the past, the body retains some residual immunity to flu viruses. But for young children who have never been vaccinated, the first dose provides only partial immunity and a second dose is required for full protection.

THE WALL STREET JOURNAL

Jennifer Corbett Dooren

Potency Issues Prompt Recall of Swine-Flu Vaccine

WSJ, 16 December 2009, 12:01 am ET
https://www.wsj.com/articles/SB126089525256092215

Sanofi Aventis SA is recalling about 800,000 doses of children's H1N1 vaccine after tests showed some batches didn't meet potency standards, the Centers for Disease Control and Prevention said Tuesday.

The CDC, in a posting on its Web site, said there were no safety concerns with the four recalled lots of swine-flu vaccine manufactured for use in infants and toddlers ages 6 months to 36 months. The vaccine was distributed throughout the U.S. The company is one of the major suppliers of infant and toddler H1N1 shots.

Sanofi Recalls 800,000 Doses of H1N1 (Swine) Flu Vaccine for Children

BioPharm, 16 December 2009
https://www.biopharminternational.com/view/sanofi-recalls-800000-doses-h1n1-swine-flu-vaccine-children

Sanofi Pasteur, the vaccines division of France-based Sanofi-Aventis Group, is voluntarily recalling about 800,000 doses of H1N1 (swine) flu vaccine meant for children between the ages of 6 months and 35 months because quality assurance tests indicate the vaccine doses lost some potency.

After a routine stability testing, Sanofi learned that this vaccine's potency was 12% below the point where it should have been. Sanofi tested additional lots and found that three other lots that had been distributed also had an antigen content that, while properly filled at the time of manufacturing, was later measured to be below pre-specified limits.

This vaccine, which was manufactured in Sanofi's factory in Swiftwater, PA, was distributed throughout the US. Vaccine doses with the following lot numbers are included in the recall:
- 0.25 mL pre-filled syringes, 10-packs (NDC # 49281-650-25, sometimes coded as 49281-0650-25): UT023DA, UT028DA, UT028CB.
- 0.25 mL pre-filled syringes, 25-packs (NDC. 49281-650-70, sometimes coded as 49281-0650-70): UT030CA.

According to the CDC, there is no safety concern and even though the vaccine isn't quite as potent as it is supposed to be, children vaccinated from the lots already will not need to be re-vaccinated.

This fall, the FDA approved four H1N1 flu vaccines, manufactured by CSL Limited, MedImmune, Novartis Vaccines and Diagnostics Limited, and Sanofi Pasteur. In November, the FDA approved a fifth vaccine, manufactured by GlaxoSmithKline (GSK).

Last month, GSK put on hold one lot of its Arepanrix adjuvanted H1N1 flu vaccine in Canada, following reports of a higher than usual number of adverse events.

Kids' H1N1 shots recalled; not strong enough

ABC 7NY, 16 December 2009
https://abc7ny.com/archive/7172519/

Atlanta - The shots, made by Sanofi Pasteur, were distributed across the country last month and most have already been used, according to the Centers for Disease Control and Prevention. The 800,000 pre-filled syringes that were recalled are for young children, ages 6 months to nearly 3 years.

Dr. Anne Schuchat, a CDC flu expert, stressed that parents don't need to do anything or to worry if their child got one - or even two - of the recalled shots. The vaccine is safe and effective, she said.

The issue is the vaccine's strength. Tests done before the shots were shipped showed that the vaccines were strong enough. But tests done weeks later indicated the strength had fallen slightly below required levels.

Why the potency dropped isn't clear. "That's the $64,000 question," said Len Lavenda, a Sanofi Pasteur spokesman.

Young children are supposed to get two doses, spaced about a month apart. Health officials don't think children need to get vaccinated again, even if they got two doses from the recalled lots, said Schuchat.

Swine flu vaccine has been available since early October, and since then manufacturers have released about 95 million doses for distribution in the United States.

The recalled shots were made by Sanofi Pasteur, the vaccines division of France-based Sanofi-Aventis Group. The vaccine all tested fine when it was shipped out earlier this fall. But last week, testing of one lot showed that the potency had fallen about 12 percent below the government standard, Lavenda said.

The company found three other lots with diminished strength. It notified government health officials and did a voluntary recall, asking doctors to return any unused doses. The vaccine has been in high demand and the company doesn't expect to see much come back, Lavenda added.

Officials with the Food and Drug Administration, the CDC and the company all said they believe the strength of the recalled doses is still high enough to protect children against the virus. No potency problem has been detected in the same vaccine packaged in other types of syringes or vials, Lavenda said.

Experts have a theory that the problem is specific to the children's pre-filled syringes. For some reason, the antigen - the key vaccine ingredient - may be sticking to the walls of those syringes, said Dr. Jesse Goodman, the FDA's deputy commissioner for science and public health.

Another manufacturer, Novartis, in February recalled five lots of seasonal flu vaccine packed in pre-filled syringes under similar circumstances.

Sanofi Pasteur bills itself as the No. 1 manufacturer of flu vaccines in the world. It makes flu vaccine at sites in France and in Pennsylvania.

Swine flu was first identified in April. During the first seven months of the pandemic, it has sickened about 50 million Americans and killed about 10,000, according to CDC estimates.

Weak vaccine given locally

The Daily Gazette, 16 December 2009
https://www.dailygazette.com/towns/schenectady/weak-vaccine-given-locally/article_640316c8-9c3f-55db-90c7-4c1272055738.html

Swine flu vaccine given out to 73 children at Schenectady County health clinics last month may not be strong enough to ward off the H1N1 virus.

Spokesman Joe McQueen said Schenectady County received 500 doses of a vaccine that was among 800,000 ordered recalled by the federal Centers for Disease Control and Prevention. He said the shots were administered to children ages 6 months to nearly 3 years, but pose no danger to the youngsters.

"It's not a safety recall," he said Tuesday. "[The shot] is not as potent as it was meant to be."

Pre-filled syringes of the vaccine were produced by Sanofi Pasteur, the vaccines division of France-based Sanofi-Aventis Group, but tests later determined the potency of the vaccine had dropped below the manufacturer's specifications. Officials from the state Department of Health were notified about the recall Monday and have determined 251 providers around New York received the weak vaccine.

Dr. Anne Schuchat, a CDC flu expert, stressed that parents don't need to do anything or to worry if their child got one – or even two – shots of the recalled vaccine. It is safe and effective, she said.

The issue is the vaccine's strength. The vaccine all tested fine when it was shipped out earlier this fall. But last week, testing of one lot showed that the potency had fallen about 12 percent below the government standard.

The company found three other lots with diminished strength and did a voluntary recall, asking doctors to return any unused doses.

Why the potency dropped isn't clear. – "That's the $64,000 question," said Len Lavenda, a Sanofi Pasteur spokesman.

Young children are supposed to get two doses, spaced about a month apart. Health officials don't think children need to get vaccinated again, even if they got two doses from the recalled lots, said Schuchat.

Officials with the Food and Drug Administration, the CDC and the company all said they believe the strength of the recalled doses is still high enough to protect children against the virus. No potency problem has been detected in the same vaccine packaged in other types of syringes or vials, Lavenda said.

Experts have a theory that the problem is specific to the children's pre-filled syringes. For some reason, the antigen – the key vaccine ingredient – may be sticking to the walls of those syringes, said Dr. Jesse Goodman, the FDA's deputy commissioner for science and public health.

Another manufacturer, Novartis, in February recalled five lots of seasonal flu vaccine packed in pre-filled syringes under similar circumstances.

Sanofi Pasteur bills itself as the No. 1 manufacturer of flu vaccines in the world. It makes flu vaccine at sites in France and in Pennsylvania.

Swine flu was first identified in April. During the first seven months of the pandemic, it has sickened about 50 million Americans and killed about 10,000, according to CDC estimates.

McQueen said the children that received the shots are generally scheduled to receive another this month anyway. He said their families will be contacted and urged to get a booster shot.

Health department spokeswoman Claire Pospisil said the recalled vaccine is no cause for alarm. She said parents of children who received vaccine from the recalled lots do not need to take any action, other than to complete the two-dose immunization series.

WINSTON-SALEM JOURNAL

N.C. is unaffected by recall of vaccine:
Flu clinic goes on

Winston-Salem Journal, 16 December 2009.
https://journalnow.com/flu-clinic-goes-on/article_56da118b-08bb-57c1-91ba-0c1c07dab221.html

A federal recall of 800,000 doses of the H1N1 vaccine – including nearly 18,000 in North Carolina – is expected to cause few problems locally, health officials said yesterday.

The doses were included in pre-filled syringes meant for children ages 6 months to 35 months. The U.S. Centers for Disease Control and Prevention said that the doses were made by Sanofi Pasteur and distributed mainly in November.

"There are no safety concerns with these lots of H1N1 vaccine," said Megan Davies, an epidemiologist with the N.C. Department of Health and Human Services.

"The concern is that the recalled vaccine may not be strong enough to provide full immunity. However, children in this age group should have adequate protection because we already recommend that they receive two doses of the vaccine."

Dr. Tim Monroe, the health director for Forsyth County, said that the department has not administered any of the affected doses. The department will have the second of two clinics in the Education Building at the Dixie Classic Fairgrounds today. Doses are being provided from 7 a.m. to 7 p.m. on a first-come, first-served basis.

H1N1 Vaccine and Pregnant Women: Misconceptions Cleared, KSPR News by Joanna Small. (comments in bold added to original text)

To vaccinate or not to vaccinate?

For years that question has sparked quite a debate, most recently among pregnant women when it comes to the H1N1 vaccine.
For years there were mass sterilization programs on unwitting women:
http://www.whale.to/m/sterile.html
http://www.youtube.com/watch?v=sNAQUOEvWBU

When it comes to H1N1 vaccines, main infertility agents are:
Polysorbate 80 (Tween 80) 5mg
http://www.ncbi.nlm.nih.gov/pubmed/8473002?dopt=Abstract

Squalene 10mg with glycoproteins
http://www.healthtruthrevealed.com/articles/10145527310/article

A first-time mom-to-be emailed KSPR, writing she was worried about getting immunized, and her doctor didn't have a recommendation either way. We took the mother's concerns to an expert.

Baby Ryder or Emilee is only fourteen weeks old, but he or she already has a place in the Owens' home. And soon-to-be mom Sammantha Owens wants to ensure her baby's home for the next 5-and-a-half months is just as safe as the nursery.
"Being pregnant and being a mom I'm always going to be paranoid and worried."

When Sammantha read this online:
"My daughter-in-law was ten weeks pregnant and had the H1N1 vaccine Friday; that night she miscarried."
And this:
"I am an emotional wreck. I feel like I had a healthy baby and caused this by getting the H1N1 vaccine."
She thought twice about putting something in her body that could hurt what's in her belly.

Sammantha is not alone in her hesitation; in fact, one OB-GYN tells us about 15% of her patients are concerned about the H1N1 vaccine's safety.

What Sammantha didn't hear was this:

"The truth is 25% to 40% of first trimester pregnancies are lost in nature."

2nd and 3rd trimester miscarriages after H1N1 vaccine as well, only a fraction reported online

http://miscarriage.about.com/b/2009/09/29/some-pregnant-women-fearful-of-h1n1-vaccine.htm

http://preventdisease.com/news/09/110709_H1N1_vaccine_miscarriage_reports.shtml

http://organichealthadviser.com/archives/shocking-h1n1-swine-flu-vaccine-miscarriage-stores-from-pregnant-women-tell-your-doctors-that-vaccines-and-pregnancy-do-not-mix

Dr. Patricia Dix says she recommends the H1N1 vaccine to every pregnant woman she treats.

"It's important they understand the decision not to vaccinate is a life-threatening one."

To explain why, the doctor cleared up some common misconceptions:

"How can they tell pregnant women they need to go get it if they haven't tested it on them?" Sammantha asks.

The tests are in progress on general population

http://www.washingtonpost.com/wp-dyn/content/article/2009/09/27/AR2009092702913_2.html

http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/H-832-en1.pdf

"We test very few things in pregnant women," Dr. Dix responds.

Therefore only these "few things" are allowed if proven safe.

"The H1N1 is so new to me it just worries me too much," Sammantha says.

"This vaccine is just like the other flu vaccine," Dr. Dix explains.

It's just a slightly different strain, and the flu vaccine is adjusted every year to include the previous year's most common , so it's always "new." "

Formulations differ significantly:

http://us.gsk.com/products/assets/us_fluarix.pdf

http://www.emea.europa.eu/humandocs/PDFs/EPAR/pandemrix/emea-combined-h832en.pdf

Just like motherhood is to Sammantha, who only wants what's best for Ryder... or Emilee.

WXYZ DETROIT

Fighting Swine Flu with Pepperoni:
Get a Shot, Get a Pizza Party

WXYZ, 17 December 2009, 6:24
https://web.archive.org/web/20091221062628/http://www.wxyz.com/news/local/story/Fighting-Swine-Flu-With-Pepperoni/EhuwIPzsFEK-yh1OqX2eug.cspx?rss=785

(WXYZ) - The Detroit Health Department is fighting swine flu with pepperoni. When kids return to school after the holiday break, each class has the opportunity to get a free pizza party – if they sign up for the shots.

It's a simple fact – kids don't like vaccinations – even when they can get them in a spray.

Their parents, like Leslie Ethridge however, are often eager to get their kids protected, "Your children get 20 some odd inoculations, this is just another one, so if it's available you should get the shot."

But when Detroit schools – both public and private-- sent home permission slips for students to get H1N1 vaccine at school, the return rate was only about ten percent.

Dr. Walter Davis, Detroit Pandemic Flu Coordinator, told us, "talking to principals and some parents we find that a lot of them are never receiving consent forms."

The Detroit Health Department has already been working especially hard to get the vaccine into the community.

For instance, today parents attending the Christmas program at the Foreign Language Immersion School on Outer Drive had the chance to get shots for themselves and their children before or after the program.

Mom, Kimberley Wallace said, "This is the easiest for me. This way I don't have to take them to the doctor's office, take them out of school or anything so it works out real well."

But apparently not well enough. So Dr. Davis and his team came up with an innovative idea. They teamed up with Happy's Pizza. And each class in the city that has a permission slip return rate of 80-percent or more will get a pizza party for the entire class.

According to Neil Master, Director of Advertising for Happy's Pizza, "Kids love pizza and we love kids in Detroit and we take care of them whenever we can."

And while the kids may sign up for the pizza, the parents need to know it's important to sign the forms because flu season isn't over just because the number of cases have leveled off.

Dr. Davis told us, "With our flu season, the peak is usually in February and it goes into March. I can tell you we will get hit again. We're in December now. In January and February, the flu will increase tremendously."

Another mom, L'Tonya Felder got shots for her children, "I think it's extremely important. It's important that the Detroit community come together and realize this is important for our health for our protection and we're combating the h1n1 as well as the regular seasonal flu."

Sanofi-Pasteur removes Thimerosal-Free Vaccine from Market

Infowars, 17 December 2009
https://web.archive.org/web/20100207224023/http://www.infowars.com/sanofi-pasteur-removes-thimerosal-free-vaccine-from-market/

On December 15, 2009 the CDC released a statement announcing the recall of 800,000 doses of H1N1 vaccine from the market. This was a story that should have received widespread coverage in the national media but, instead, largely died out at the local news level. Although some local stations made the recall their top story, many simply reported it as if it were no big deal and mentioned nothing else about it in subsequent broadcasts. Yet you would think that the recall of close to 1 million vaccines would spark the national interest, especially when the vaccines are for a "pandemic" that was initially supposed to kill hundreds of thousands of Americans and disrupt the entire society.

If one chooses to believe the hype about H1N1 then he/she should be quite worried about the reasons given for the recall – that it is not potent enough. The fact that the company who manufactures the vaccine is Sanofi-Pasteur is also significant because Sanofi-Pasteur made a similar mistake with the H5N1 vaccine in 2006. At the time, H5N1 was the virus that was supposed to kill us all. It seems that the lack of potency issue is a recurring theme with this particular company demonstrating, at best, a dangerous level of incompetence.

Since true independent science has never been able to find that vaccines are even effective, let alone safe, potency becomes a non-issue to those of us who do not take Big Pharma's word as truth. However, there are two peculiar questions regarding this recall that need to be asked.

First, although Sanofi-Pasteur and the CDC cite lack of potency as a reason for the recall, they seem to cast doubt upon their own claims. The "potency" of a vaccine is merely measured by the concentration of the antigen (the active ingredient), and the CDC admits in its' own statement that the potency of the vaccine is only "slightly below the specified range (CDC FAQ)." Yet they go on to say that "The vaccine in these lots is still expected to be effective in stimulating a protective response despite this slight reduction in the concentration of antigen (CDC FAQ)." If the media and government claim of vaccine shortage is true, it would seem illogical to recall such a large number of them if they were still effective.

Second, and perhaps most disturbing, is the fact that the vaccines being removed from the market are the preservative and thimerosal free versions. In article published by Bloomberg, Tom Randall writes, "The recalled shots are preservative-free syringes of a low-dose version made for children ages 6 months through 25 months, [Anne Shuchat, head of the National Center for Immunization and Respiratory Diseases at the CDC] said. There are no remaining preservative-free shots available for children under 2 years old (Randall)." According to Randall, Schuchat goes on to say that thimerosal has proven safe in different studies even though some parents are leery of it.

The idea that thimerosal, aluminum, monosodium glutamate, or any of other preservatives used in these vaccines is safe is absolutely ludicrous. The fact is, thimerosal is 49.6% mercury. The EPA itself declares .1 mcg of mercury to be toxic yet there is, on average, 25 mcg in a single flu shot. The science that Shuchat refers to is the new brand of welfare science that relies on research grants from Big Pharma, vaccine makers, and eugenics foundations. True independent science has shown just the opposite of her claims.

Regardless of the lack of coverage by the mainstream media (something informed individuals should be used to by now), this is information that needs to be distributed. This recall has effectively removed all preservative-free vaccines off the market for children under two. So, for those parents who at least know to ask for thimerosal-free vaccines, the option is no longer on the table. With only the thimerosal vaccine now available, one has to wonder if potency was ever an issue at all or if the recall was merely an attempt to leave the plebs with only one option. That is, if they are uninformed enough to be vaccinated to begin with.

TAIF – Authorities are urging legal guardians to let their children be administered the swine flu vaccine following a nationwide Ministry of Health survey revealing that 65 percent of school pupils' parents do not intend to sign their approval.

A ministry source said on the eve of the launch of the national vaccination campaign that guardians' failure to enquire of the date for administering the vaccination or of the nature of the vaccination itself reflected a "complete rejection" of what is a voluntary immunization requiring parental approval.

"I hope guardians come to understand the importance of this vaccination which is safe and has no side effects as shown by World Health Organization reports," the ministry source said.

The ministry study was conducted with the help of regional education administrations, and the Ministry of Education urged parents on Thursday to approve vaccination for their children, citing the "threat of an expected third wave of the virus during this winter season." – Okaz/SG

Could the H1N1 Vaccine be Causing Miscarriages?

The Flu Case // Progressive Convergenc, 22 December 2009, 00:44
https://web.archive.org/web/20100102031346/http://theflucase.com/index.php?option=com_content&view=article&id=2372%3Acould-the-h1n1-vaccine-be-causing-miscarriages&catid=1%3Alatest-news&Itemid=64&lang=en

...

Miscarriage Cases:

1. **EBWashington:** I am so upset. I was so excited to be pregnant after trying for a year. As soon as I found out I was pregnant, I joined this birth club and I was due June 25th. We have two healthy boys with no history of miscarriage. Everything was going great. Last Monday, I got the H1N1 vaccine thimerosal reduced (mercury reduced for pregnant women). On Tuesday morning, I started cramping and on Wednesday I started bleeding heavily. My hcg was 50 on Wednesday and I was almost 6 weeks along so it was low. They still thought that I might be pregnant but on Friday my hcg was down to 22. I am an emotional wreck. I feel like I had a healthy baby and I caused this by getting the H1N1 vaccine. My doctors pushed it. I researched online and there have been many miscarriages after the H1N1 vaccine but they haven't been reported since it is hard to say what caused the miscarriages. I hope that I did not cause this. I wish everyone the best.

2. **Tayla08:** I don't have an answer for you, but a friend of a friend just had a miscarriage 2-3 days after getting the shot. She was 7weeks. She had no previous history of m/c... No one can answer if they're related...it hasn't been out long enough and there haven't been any studies done on pregnant women. I will tell you, that it has made up my mind on getting it...I won't and I'm not going to get it for my DD either. My daughter and I both had H1N1 last week, and although it truly sucks...I think I'll take my chances. One doctor will tell you to get it and the next will tell you not too...you have to do what's in your heart.

3. **90707:** My heart goes out to you as i recently miscarried as well and was due in June. I had a healthy heart beat at 6wks. then at 7.5 wks my son got the h1n1 mist vaccine which has live vaccine in it. the nurse said to be careful b/c it could technically spread if he rubbed his nose and touched a surface etc. the next night i miscarried and 5 days later was diagnosed with h1n1. I work from home, kids are home, hadn't been anywhere during that time. so the chances that it is all related are very high. The flu mist vaccine warns for immunocompromised patients (which includes prego) to stay away from recipients of the flu mist for 21 days.

5. **Jo:** I got the flu vaccine (regular not H1N1) at 8 weeks pregnant. Three days later I miscarried. I am not going to get the H1N1.

6. **Regrets:** I got both vaccines on Thursday. I was 9 weeks pregnant. I miscarried on Sunday. I was told by several doctors to get these vaccines. Now I wish I followed my gut feeling and not get them at ALL!

etc ...

TAIPEI 台北時報 TIMES

Jimmy Chuang

Doctor to sue DOH over vaccinated son's death

Condolences CDC Director-General Steve Kuo said the DOH would not alter its H1N1 immunization plan, but officials were sorry they hadn't been able to help the boy .

Taipei Times, 23 December 2009.
https://www.taipeitimes.com/News/taiwan/archives/2009/12/23/2003461619

A physician whose seven-year-old son died 32 days after receiving an H1N1 flu vaccine said yesterday that he intends to sue the Department of Health (DOH).

Centers for Disease Control (CDC) Director-General Steve Kuo (郭旭崧) said yesterday that the CDC respects the Taichung County doctor's decision but the Department of Health had no plan to change the nationwide influenza H1NI immunization program.

"It is still safer for you to get the shot," Kuo said. "There is also no evidence at present to link the boy's death to the vaccine."

Kuo said the boy's father called the 1922 H1N1 vaccination consultation hotline on Dec. 2 after his son developed a high fever and a skin rash. The boy had received an H1N1 shot on Nov. 19.

Kuo said Deputy Department of Health Minister Chang Shan-chwen (張上淳) and CDC experts immediately held an emergency telephone conference with the child's father to offer help, but the boy died on Monday.

"We are all sorry we were unable to help," Kuo said.

After preliminary discussions, the experts concluded that the boy's death was unrelated to the vaccination, Kuo said, adding that an immune system problem was a possible cause of death.

"The boy's parents are welcome to request an investigation into the case to allow experts to make a more comprehensive, independent judgment," Kuo said.

An inoculation program for people considered at high risk of contracting swine flu began on Nov. 1 and the nationwide immunization program began on Dec. 12 at 2,584 clinics and hospitals and 354 DOH vaccination stations.

Problems and side effects that have been reported so far from the vaccine include deaths among elderly recipients and dizziness among students. These have dissuaded some from getting vaccinated.

Health officials said the reports of dizziness caused some parents, to withdraw their permission for their children to receive the shots.

"A total of 331 cases of side effects from the vaccines has been reported, but all the symptoms were temporary," Kuo said. "These cases will not affect our vaccination policy."

The total number of hospitalized H1N1 patients in Taiwan since the outbreak began reached 817 yesterday, Kuo said.

Initial trial use of A/H1N1 vaccine for children below 3 shows no severe adverse reactions: ministry.

News XinhuaNet, 25 December 2009, 19:58:44
https://web.archive.org/web/20151001000528/http://news.xinhuanet.com/english/2009-12/25/content_12704915.htm

Beijing, Dec. 25 (Xinhua) – China has begun clinical trial use of A/H1N1 flu vaccine designed for children between 6 to 35 months old, and "none of the volunteers has exhibited any signs of severe adverse reactions after receiving the first shot," the Ministry of Health said Friday.

The clinical trials began at the beginning of this month and were conducted in three bases in provincial-level areas including Guangxi, Jiangsu and Hunan, according to the ministry.

Three vaccine producers - Beijing-based Sinovac Biotech Company, Zhejiang Tianyuan Bio-Pharmaceutical Co. Ltd., and Shanghai Institute of Biological Products - were responsible for conducting the tests, it said.

Among 935 participants, 209 were children between 6 to 12 months old, 363 aged one, and 363 aged two. They would begin to receive another round of vaccination from Dec. 23, the ministry said in a report on its website.

The ministry and the State Food and Drug Administration approved the trials to better protect children aged below three, who have a high risk to infect the A/H1N1 strain, the report reads.

The Chinese mainland has reported 91 deaths from the A/H1N1 influenza in the week from Dec. 14 to 20, latest figures from the ministry showed.

As of Thursday, almost 43.33 million people nationwide had been inoculated against the A/H1N1 flu while more than 75.4 million doses of vaccines had been approved for use.

People's Daily Online

Singapore reports low demand of H1N1 vaccines for children

People's Daily Online // News XinhuaNet, 29 December 2009
https://web.archive.org/web/20140408061924/http://english.people.com.cn/90001/90782/90880/6854483.html
https://yoursdp.org/2009/12/29/singapore_reports_low_demand_of_h1n1_vaccines_for_children/v

Singapore’s polyclinics and private clinics are seeing a low demand for the H1N1 vaccines for children, with an average of only two requests per day, local media reported on Monday.

According to local TV broadcaster Channel NewsAsia, the nine polyclinics under the Singhealth Group have seen a total of 121 children below 10 years of age receive vaccinations for the H1N1 virus. And the Raffles Medical Group said its 42 clinics have seen a total of 20 patients per day coming in for H1N1 vaccinations with children making up less than 10 percent of that group.

The Singapore government has approved the use of H1N1 vaccines for young children after a H1N1-related death of a two-year-old child in November.

Local polyclinics said the low demand for the vaccines could be due to many families flying overseas for their vacations and they’re expecting more children to come forward for their vaccinations after the school term starts.

Singapore reported its first confirmed case of flu A/H1N1 on May 27. The flu has caused 19 deaths in the country.

TERRADAILY
NEWS ABOUT PLANET EARTH

China offers free swine flu jabs to children under 3

Terra Daily, 8 January 2010.
https://www.terradaily.com/reports/China_offers_free_swine_flu_jabs_to_children_under_3_999.html

Beijing – China has said it will offer free swine flu jabs to children aged six months to three years, as the government ramps up its vaccination programme ahead of the Lunar New Year holidays.

Children are among the most susceptible to the A(H1N1) influenza virus, the health ministry said in a statement posted on its website Thursday.

A vaccination designed for children had been tested in several regions, Xinhua news agency said, citing an earlier statement from the ministry.

China has so far vaccinated nearly 51.4 million people, the health ministry said – the largest campaign in the world, but still only a small proportion of the country's 1.3 billion people.

The government reported a total of 659 swine flu deaths by the end of 2009, with nearly all of them in the last two months of the year. The ministry has warned that the danger of mass outbreaks still exists in certain areas.

Ministry officials have warned of a "grim" winter flu outlook, and are urging caution ahead of the February Lunar New Year holidays, when hundreds of millions of people swamp roads and railways to visit loved ones.

Children under five will now be offered the swine flu vaccine, health bosses revealed today

Norwich Evening News, 11 January 2010
https://www.eveningnews24.co.uk/news/22391437.norfolk-under-5s-receive-swine-flu-jabs/

Children under five will now be offered the swine flu vaccine, health bosses revealed today.

NHS Norfolk has announced that an agreement has been made with local GPs for them to offer the jab to this next target group in the vaccination campaign.

The plans mean parents with children aged from six months to five years will soon be contacted by their GP practice to invite their child along to a vaccination session.

Children who are in this age group are the focus of phase two of the swine flu vaccination campaign, as national trends show they may be particularly vulnerable to the virus.

Dr Ian Hume, a GP and chairman of the Local Medical Committee, said: "I am very pleased to say that GPs will be offering children under five the vaccination against the swine flu vaccine. We know that children can be particularly vulnerable to the virus and this strain may be around for a number of years, so it is essential that parents take their child to receive the vaccination when they are invited."

The arrangement with local GPs comes after discussions between NHS Norfolk, the Local Medical Committee and the GPs themselves.

Following the agreement between these parties for GPs to provide the vaccinations to the children, practices will now be collating a list of patients who are in the relevant age group.

WebWire®

90% of American physicians believe Swine Flu jab should be given to pregnant woman, versus only 20% in China

WebWire – Sunday, 24 January 2010
https://web.archive.org/web/20100706123228/http://www.webwire.com/ViewPressRel.asp?aId=111491

London – Leading global market intelligence firm Synovate today released data from a study examining the physician's view of the recent Swine Flu pandemic. The survey, which interviewed physicians from the UK, France, Germany, Italy, Spain, USA, China, Taiwan and India about their views of the subject, revealed some interesting findings

Key highlights:

* 90% of doctors in the US feel that pregnant women should be given the vaccine compared to just 20% of doctors in China.
* 82% of UK doctors feel the media has over-dramatised the situation.
* 58% of European doctors have seen their workload increase as a result of swine flu compared to just 35% in the US.
* 76% of doctors in Taiwan have been vaccinated.

Vaccination: true believers or a safety net?

The subject of swine flu vaccination had the doctors divided. Just over half of those surveyed (51%) have themselves been vaccinated, the highest number of which was in Taiwan (76%) and the lowest in Spain (21%). Whilst 37% overall had not had the vaccine nor intended to have it within the next month, 24% of this group still agreed that those under 21 years of age should receive the vaccination and 32% also agreed that frontline staff should receive it.

Overall, just over half of the respondents agreed or strongly agreed that young people should be vaccinated. Opinion was much stronger in the US with 88% of doctors agreeing, compared to only 44% in Europe.

Commented Jackie Ilacqua, Head of Global Oncology at Synovate: "In the US we very much have a culture of prevention, so it is not surprising that vaccinations are so strongly encouraged. Perhaps more importantly, in this case, this high figure could be attributed to the many false negatives there have been to the H1N1 test and the resulting statistics on the number of patients affected actually being understated"

Fifty-seven percent of respondents agreed that "pregnant women should be vaccinated as soon as practical" Again, the US physicians felt most strongly with 90% of US doctors agreeing with this statement.

In stark contrast, only 20% of doctors in China agreed. Commented Robert Pollard, Director of Synovate Healthcare China: "Culturally, the Chinese are hesitant to use prophylaxis, especially so when their single child is involved. The low agreement with the statement is probably a result of doctors feeling the risks outweigh the possible benefits. We have seen in other studies in which we talk to frontline outpatient doctors in hospitals that very few of them ever consider having a flu shot even when provided free by their hospital"

Sixty-two percent of doctors surveyed agreed that the swine flu vaccine provides effective protection, while 27% were uncertain. The remaining 11% believe that it does NOT provide effective protection.

A job well done?

As with any issue that becomes a national and even international concern, government reaction is heavily scrutinised. Communication, support and infrastructure to deal with the crisis, as well as control and recovery are all components of an epidemic contingency plan which people expect their government to deliver on. The swine flu outbreak is no different. In this instance, when it came to government handling of the situation, opinion was pretty much split equally with 38% of doctors agreeing that their government had handled it well, 33% disagreeing and 28% neither agreeing nor disagreeing.

The Asian markets seemed to be the most satisfied with their governments' reaction: 54% agreed that it has been well handled. In Europe, it is a rather different story with only 26% agreeing.

There was also a clear contrast between the views of primary care providers and specialists - 40% of primary care providers indicated that they felt their government had not handled the swine flu outbreak well, compared with only 28% of specialists stating the same.

A well documented crisis or a media circus?

Sixty-one percent of all physicians surveyed felt or felt strongly that the media in their country has over-dramatised the swine flu outbreak. There were notable regional differences in opinion: 75% of respondents in the European markets agreed, 48% in Asia, and 46% in the US.

Commented a doctor in Germany: "In Germany, we now have 80 million experts with 80 million different opinions. This very important topic has become a victim of a lukewarm election campaign played out in the media"

Perhaps the most critical were the UK doctors with a huge proportion (82%) agreeing or strongly agreeing that the British media has over-dramatised the situation.

Commented Steve Lowery, Group Head Healthcare Custom research UK: "This is hardly surprising given the often sensationalist nature of the British tabloid press. When we consider the media hysteria in recent years about both SARS and Bird Flu, perhaps it is little wonder that this time doctors feel that the risks of swine flu have been exaggerated somewhat in some parts of the media"

In China however, there was a rather different story, with a mere 31% of doctors being unsupportive of the level of media publicity in their market. As with opinion on government handling, a significantly larger proportion of primary care physicians felt the media in their market had over-dramatised the situation (72%) than specialists (55%).

About the study

This survey was conducted from 20th November 2009 to 9th December 2009 with members of Synovate's proprietary physician panel, which operate in many major markets around the world, and overseen by Synovate Healthcare. The Synovate Healthcare online team offers specialist advice and data collection services, utilising cutting edge technology and providing unrivalled reach.

About Synovate

Synovate, the market research arm of Aegis Group plc, generates consumer insights that drive competitive marketing solutions. The network provides clients with cohesive global support and a comprehensive suite of research solutions. Synovate employs over 6,400 staff across 62 countries.

Bangkok Post

Miscarriage prompts halt to flu jabs
Ministry denies link, launches an inquiry

Bangkok Post, 29 January 2010, 12:00 AM
http://www.bangkokpost.com/news/local/31909/miscarriage-prompts-halt-to-flu-jabs (deleted)
https://vactruth.com/2010/01/31/miscarriage-prompts-halt-to-flu-jabs/

H1N1 flu vaccinations among pregnant women *have been suspended* after a woman who received a jab lost her baby to *miscarriage a day later*.

The Public Health Ministry yesterday *denied any link* between the vaccinations and the foetal death, but as a precaution suspended flu shots among pregnant women pending an investigation into the miscarriage in the southern province of Satun.

It said it would press ahead with a plan for an H1N1 vaccination campaign aimed at high risk groups despite concerns about possible side-effects.

"There's no substantiated report of H1N1 vaccine having a harmful effect on pregnant women," Public Health permanent secretary Paijit Warachit said yesterday. "The product is certified and safe for use."

Over 6,000 pregnant women have received the vaccination, imported from the French company Sanofi Pasteur, under a national campaign to tackle the mortality rate caused by type-A (H1N1) influenza among high-risk groups including pregnant women.

The 39-year-old *woman lost her baby during the 24th week of pregnancy* in Satun's Thung Wa district on Monday, only a day after she was given a flu shot.

An investigation into the miscarriage at Songkhlanagarind Hospital is under way and the results are expected within a week, Dr Paijit said.

A case of a 32-year-old woman *delivering a baby during her 33rd week of pregnancy* was not caused by vaccination or toxaemia in pregnancy.

Early delivery was essential in this case because the mother had taken a fall and suffered internal bleeding in the brain, he said.

Kamnuan Ungchusak, an epidemiological expert at the Disease Control Department, conceded the report might affect confidence in the vaccination scheme, particularly among pregnant women.

The antigen which is the active ingredient in the H1N1 vaccine could not pass from the mother to an unborn child.

However, the medical committee would discuss the case at its next meeting on Feb 9.

Thailand is conducting the first human trial of a locally made vaccine for type-A (H1N1) influenza.

A preliminary report had found the vaccine was safe and could provide immunity against the virus among volunteers.

The initial result of the first-phase trial was satisfying, said Vichai Chokewiwat, the Government Pharmaceutical Organisation board chairman.

Of 24 volunteers, only 13 had reported minor side-effects such as headaches, joint pain and a runny nose.

Researchers, however, would not rush to begin the vaccine trials with a larger group of 400 volunteers as more work was needed to improve the vaccine's stability. The second-phase of the trial was scheduled for April.

The first batch of locally produced vaccine would be ready to combat any influenza outbreak during the monsoon season if the trial went as planned.

UNICEF-Impfaktion für 500.000 Kinder in Haiti
Relevant.at, APA/DPA, 1 February 2010
https://relevant.at/2010/02/01/uno-begann-haiti-grosse-lebensmittelverteilung/

– Port-au-Prince (APA/dpa)
Das UNO-Kinderhilfswerk Unicef startet am Dienstag eine Impfaktion in Haiti: Eine halbe Million Kinder sollen gegen Masern, Diphtherie und Tetanus immunisiert werden. Besondere Aufmerksamkeit gilt unter Zweijährigen, für die diese Krankheiten das größte Risiko darstellen. Durch schlechte hygienische Bedingungen sei es zu ersten Fällen von Durchfallerkrankungen und Tetanus gekommen.

Verbesserungen gab es laut Unicef bei der Verteilung von sauberem Trinkwasser seit dem Erdbeben am 12. Jänner: Die tägliche Versorgung wurde auf 2,3 Millionen Liter angehoben – genug für eine halbe Million Menschen. Unter anderem werden 60 Waisenhäuser mit Trinkwasser beliefert.

Unter großem Sicherheitsaufgebot hat am Sonntag bereits das Welternährungsprogramm (WFP) der Vereinten Nationen mit einer großangelegten Ausgabe von Lebensmitteln begonnen. Hilfsorganisationen verteilten 25-Kilo-Säcke mit Reis. UNO- und US-Soldaten sowie einheimische Sicherheitskräfte überwachten die Aktion.

Das WFP richtete 16 feste Verteilstellen in Port-au-Prince ein. In den kommenden beiden Wochen sollen auf diese Weise zwei Millionen Menschen mit Lebensmitteln versorgt werden. Die haitianische Regierung hat das Weiterverkaufen von Lebensmittelhilfe für illegal erklärt.

Schwer verletzte haitianische Erdbebenopfer können unterdessen wieder darauf hoffen, zur Behandlung in die USA geflogen zu werden. Ein Sprecher des Weißen Hauses teilte am Sonntag mit, die USA wollten die ausgesetzten Evakuationsflüge aus Port-au-Prince wieder aufnehmen.

Das österreichische Landwirtschaftsministerium wird im Februar eine Million Euro für Nahrungsmittel-Hilfe in Krisenregionen bereitstellen. Der Löwenanteil von einer halben Million Euro fließt über das UNO-Welternährungsprogramm an die Opfer des Erdbebens in Haiti. Mit dem Geld sollen Lebensmittel gekauft werden. Mit den übrigen Mitteln wird der notleidenden Bevölkerung in Nicaragua, Mosambik und Moldawien (Republik Moldau/Moldova) geholfen, sagte Umwelt- und Landwirtschaftsminister Berlakovich am Montag.

UNICEF to give 500,000 children in Haiti dangerous jabs from Tuesday

The Flu Case, 1 February 2010
https://web.archive.org/web/20100410202145/http://www.theflucase.com/index.php?option=com_content&view=article&id=2664%3Aunicef-to-give-500000-children-in-haiti-dangerous-jabs-from-tuesday&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The UN agency, Unicef, is starting a mass vaccination campaign in Haiti on Tuesday with the goal of giving 500,000 jabs against measles, diphtheria and tetanus, reports the Austrian Press Agency, APA.

Children under 2 years of age are to be the focus of the campaign.

A recent study by the John Hopkins University compared the life expectancy of children in Africa who participated in Unicef vaccination campaigns and children who did not participate and found that *children were much more likely to survive if they did not get Unicef vaccinations*.

Unicef has not indicated that it intends to revise its vaccination policy in the light of these findings.

The John Hopkins study will fuel fears that vaccinations are being given by the UN agency to children in Haiti in order to cause death and damage as part of a global depopulation campaign.

9 New Stories of Pain and Loss from Pregnant Women who Lost their Babies after Receiving the H1N1 Vaccine

Is the H1N1 swine flu vaccine causing miscarriages? Is the vaccine safe for pregnant women to take? Those are questions that thousands upon thousands of pregnant women have wrestled with over the past couple of months as they have decided what to do about the swine flu. The WHO and U.S health authorities insisted that the H1N1 swine flu vaccine was perfectly safe for pregnant women and pushed them to the front of the line. So thousands of women did run out and get themselves injected with the vaccine. Now reports are pouring in from all over the United States of women who have lost their babies very quickly after receiving the H1N1 vaccine. Many of these women are overcome with pain and a feeling of loss and are looking for answers. They end up on sites like this one because the mainstream media won't touch this story with a ten foot pole (lest they offend the pharmaceutical giants and their millions of dollars in ad money). Fortunately there are alternatives to the mainstream media now. The following are stories from 9 of our readers who have lost their babies very soon after getting the H1N1 swine flu vaccine. We challenge anyone who still believes in the safety of this vaccine to read all of the following stories and then to explain to the rest of us why we should not be concerned.

The truth is that the H1N1 swine flu vaccine is NOT safe for pregnant women. The following are unedited personal testimonies left as comments by readers of this site.....

#1) Kelly:
If you haven't had a miscarriage, you shouldn't comment about someone that has. This is my second miscarriage. I know my first miscarriage had absolutely nothing to do with the H1N1 shot (because it was in 2003), however, this time I believe there definitely could be a connection. I had 3 healthy babies after my first miscarriage. When I went to have my H1N1 shot (which was HIGHLY recommended by the Health Office workers since I WAS pregnant and I higher risk of H1N1), I was around 5 weeks pregnant. When I went in for my next ob appointment, I had an ultrasound that showed I was only 5 week and 2 days, although by that point I was almost 9 weeks pregnant. I never had any symptoms. The baby just died. Instead of reading about how pregnant women shouldn't get the shot, the ONLY thing I read about pregnant women and the H1N1 shot is that they were top priority for the shot and should have it done as soon as possible. My doctor thought I may have just miscalculated and waited another few weeks to test levels (once a week) until we knew for sure what was going on. Three weeks later (should have been 12 weeks pregnant), I was told that the ultrasound was still showing 5 weeks and 2 days and that the baby was no longer living. I had to have a D&C. Not only was the physical pain traumatizing but the emotional pain was beyond bearable. Something needs to be done. PLEASE, take all of this into consideration before deciding

if you are going to get the shot. I wish I wouldn't have… There seems to be WAY too many stories for this to be a coincidence. If this is what our country is coming to, God, please help us all!

#2) Amy:
I got the H1N1 vacc. when I was 4 and a half weeks pregnant. I started bleeding 2 weeks later and went to the doctor and was told my pregnancy looked perfect for a 4 and a half week pregnancy! Sounds like to me that everything was perfect until I got the vacc. We were completely devastated and I wish I knew the risks before I got it, but the docs will tell you miscarriages happen every day, but that is not good enough for me.

#3) Canada Also:
We were in our 6 month of pregnancy, and we also got the vaccine, We also lost our baby, within 10 days of taking the vaccine. We also asked our Dr what could of caused this, they gave us many reasons, then we brought up H1N1 Vaccine, and before we could get the INE out in vaccine, they dismissed it as possible cause. I asked how could it be everything else, and this is not even considered and dismissed immediately, I think if they did a study and found out that it does cause miscarriages, they entire health system would be under scrutiny and law suits.

It was our second child of which we do not have history of miscarriages or any medical or health issues. Upon delivery the baby looked perfect and no umbilical chord around its neck.

#4) Kirylo:
Last month on Nov.16th I had my son premature at 22 weeks along in my pregnancy he lived 5 hrs and then died of heart failure. About a week prior I received the H1N1 Flu vaccine. I began cramping in my lower abdomen and bleeding heavily on Thursday night and after 75 hrs of labor trying to keep my son inside me as long as possible I delivered him on Monday morning. After reading many of these stories I am convinced that I would still be pregnant if I would have denied the vaccine!

#5) Lucy:
I should be 11 weeks and two days pregnant today. I had an appointment with my OB/GYN today and was told (from info of ultrasound) that my baby stopped growing on the exact day I had my H1N1 vaccine! This is a very sad day for my family and I. This would have been our first baby. I have submitted a report of my "adverse event" on the following site: ttps://vaers.hhs.gov/esub/index

To all those that have had problems with the vaccine I would suggest to report your event as well so the government can track this.

After researching the H1N1 vaccine (which I WISH I would have done before I took the vaccine), I cannot believe that all these officials and medical professional would think for a minute that injecting a drug that may contain mercury, formaldehyde, polysorbate 80 (associated with infertility), triton X100 (a strong detergent), phenoxyethanol (antifreeze) and many other toxic ingredients would be SAFE!

It seems as if there is a hidden agenda out there. Just think of the billions of dollars these pharmaceutical companies are making! Could THAT be the agenda??? I wonder…. HOW can the Pharmaceutical companies get away with giving vaccines that can cause death?! To anyone else that would be a crime!

I think we ALL need to join together and try to change the law so that we can protect this from happening to others. We should all push for legislature that will protect ourselves AND our unborn from this crime.

#6) Amanda:
I have a healthy 1yr old boy no complication or history of miscarriages. I got the H1N1 vaccine to protect me and the baby at 7weeks pregnant. I lost the baby a week and a half after

#7) Carolyn:

I was 4 1/2 weeks pregnant when I got the H1N1 shot. I started spotting 2 days later, then a 2 weeks later lost my baby. I have 2 kids, with no history of miscarriage. If I could take back getting it I would because I think it caused my miscarriage. My doctor does not believe it does.

#8) Mandy:

I was 5 weeks pregnant when my doctor suggested I get the H1N1 vaccine. I received the shot on a Thursday and was very sore and achy on Friday. I miscarried my baby on Sunday, just 3 days after receiving the shot. This was my first pregnancy and I thought I was doing the best thing for myself and my baby by getting the shot. I was encouraged to get the shot by my doctor and was not told that I should wait until I was further along. Also, I was not warned of any side affects accept for a sore arm where I got the shot. I was given the Novartis shot.

#9) Paula:

I was 14 weeks pregnant almost and took the H1N1 shot because my dr. said to and a few minutes afterwards I had severe headaches and shortness of breath, i called everywhere but no one would tell me nothing, then a couple of days after that i started spotting blood and had to be taken to the emergency room for a threatened miscarriage, then 4 days later i went to the OBGYN for an ultrasound my baby was fine until a couple of days later when i went back for an ultrasound and my baby had died it was a missed miscarriage I had to wait 2 days for them to do a dnc. I had my baby and placenta sent to the lab for testing ,the results came back my baby was healthy, my chromosomes were fine everything was fine, even the sex, she was a little baby girl! my baby girl! and i think we have all been misinformed by our doctors, and i think the H1N1 shot killed my baby! and i will fight to get the answers because i want justice for my baby!

U.S. health officials urge second dose of A/H1N1 vaccine for kids in spite of inadequate clinical safety data

Xinhua English News.CN, 6 February 2010, 13:25
https://web.archive.org/web/20100209104940/http://news.xinhuanet.com/english2010/health/2010-02/06/c_13165882.htm

Houston, Feb. 5 (Xinhua) – U.S. health officials have asked parents to get their children under 10 years of age fully vaccinated against the A/H1N1 flu virus as another wave of strike might be coming soon.

Hawaii state health department said on Tuesday that, in Hawaii and a number of other states, there are many children who have not received their second dose, and that there are still many children who have not been vaccinated against the A/H1N1 at all.

In Washington state, health officials say that only a quarter of vaccinated kids under age five have received the second dose. Studies on the A/H1N1 vaccine show that it takes three to four weeks after the second dose before kids under 10 are fully protected.

The second dose of A/H1N1 vaccine for the youngsters under 10, recommended by the Centers for Disease Control and Prevention (CDC), would achieve maximum protection against the new virus, said Hawaii State Epidemiologist Sarah Park.

Experts said parents are aware of the need to get kids vaccinated at the height of influenza breakouts but their attention drops when things normalized.

After nearly a year of news headlines, worry and confusion, the latest statistics released by the CDC find no states reporting widespread influenza activity and only six reporting regional activity.

To wake up the general public, health officials in Ohio warned parents that there is a possibility for a third wave of the A/H1N1 flu. "Don't let your guard down," said Dr. William Mercer, director of the Wheeling-Ohio County Health Department. "If we learned anything from 1957, there was another wave and that started in the middle of February."

The seasonal flu is also expected to peak soon, Mercer said, encouraging people to get both the A/H1N1 and seasonal flu vaccines.

Dr. Scott Brady, co-chair of Florida Hospital's A/H1N1 task force said:"The A/H1N1 is still out there, and is probably going to stick around for a while." He also called for attention to the regular seasonal flu, which generally peaks in the second or third week of February and kills 36,000 adults a year.

With the supplies of A/H1N1 flu vaccine reach to 147 million doses by the end of last week, local health officials are encouraging everyone to get vaccinated.

The A/H1N1 virus is predicted to be the dominant strain of flu that will circulate next year, said Dr. Yuan Po-Tu, medical director of walk-in clinics in Snohomish County, Washington. "So even if the flu doesn't come back this spring, by getting two doses, you're setting them (children) up for protecting them next fall," he added.

The CDC estimated in December that the A/H1N1 flu had killed 10,000 people in the United States, including 1,100 children and 7,500 younger adults, since the start of the pandemic in April.

H1N1 Vaccine Unsafe for Pregnant Women and Children?

Info News (NZ), 7 February 2010, 11:33 PM
https://www.infonews.co.nz/news.cfm?id=47720

Dear Friends,

As you may know, the Ministry of Health is starting an A/H1N1 ("swine flu") influenza vaccination campaign in February. According to the Sunday Star Times, the targets of this campaign will be health professionals, pregnant women "and all *children aged from six months to five years enrolled* in GP practices in poorer areas or with high proportions of Maori or Pacific Islanders".

I am taking the time to write to you about this vaccination campaign because I have serious concerns about the safety of the A/H1N1 influenza vaccines, especially for pregnant women and children.

Are H1N1 influenza vaccines safe for pregnant women?

If you are pregnant, or planning to become pregnant, you should be aware that according to information provided to the Ministry of Health by Baxter about its A/H1N1 influenza vaccine ("Celvapan") "The safety of CELVAPAN in pregnancy and lactation has not been assessed in clinical trials."

=>https://web.archive.org/web/20100526012255/http://www.medsafe.govt.nz/profs/Datasheet/c/Celvapaninj.pdf

Women in North America who have been vaccinated against A/H1N1 influenza have reported *foetal death* and *miscarriages* following the shots.

=> https://web.archive.org/web/20091112143056/http://preventdisease.com/news/09/110709_H1N1_vaccine_miscarriage_reports.shtml

=> https://web.archive.org/web/20100413024019/http://www.theflucase.com/index.php?option=com_content&view=article&id=2593%3Ais-the-h1n1-swine-flu-vaccine-causing-miscarriages&catid=1%3Alatest-news&Itemid=64&lang=en

Are the A/H1N1 influenza vaccines safe for children?

Parents of young children who may be offered the A/H1N1 influenza vaccine should be aware that there is little information available about the safety of the A/H1N1 influenza vaccines for children.

The datasheet for Baxters A/H1N1 influenza vaccine ("Celvapan") states:

"From clinical studies limited safety data are available for Celvapan (H1N1) in healthy adult and elderly subjects and in children." (Page 1)

=>https://web.archive.org/web/20100526012255/http://www.medsafe.govt.nz/profs/Datasheet/c/Celvapaninj.pdf

What's more, the datasheet states that for children and adolescents "data are only available after the first dose at this time." (Page 8) (The date on the last page of the datasheet is 28/1/10)

=>https://web.archive.org/web/20100526012255/http://www.medsafe.govt.nz/profs/Datasheet/c/Celvapaninj.pdf

In fact, according to the Clinical Trials registry of the United States, Baxter is still recruiting participants aged "2 Months and older" into a study (NCT00950456) of their A/H1N1 influenza vaccine.

http://clinicaltrials.gov/ct2/show/NCT00950456?term=H1N1+influenza+vaccine+%2B+Baxter&rank=2
http://clinicaltrials.gov/ct2/show/NCT00976469?term=H1N1+influenza+vaccine+%2B+Baxter&rank=3

As you can see by clicking onto the link above for trial NCT0076469, most of the children in the study will receive two injections given three weeks apart, while a few will be given a third injection as a "booster". The children will be followed up for only one week after each injection to assess safety. Their immune response to the vaccine will also be studied. The estimated study completion date is May 2010.

If you click on the link below for trial NCT009080850 you will see another trial. Children in this study will be followed up for three weeks after each dose. It's a bit better than the trial discussed above, but certainly not long enough of a follow up period to see whether the vaccine causes any long term side effects. The estimated completion date for this trial is September 2010.

http://clinicaltrials.gov/ct2/show/NCT00980850?term=Baxter+%2B+H5N1+%2B+vaccine&rank=8

What's more, even though the registration of Baxter's A/H1N1 influenza vaccine was based on Baxter's A/H5N1 influenza vaccine (also called "Celvapan") it seems that the trials for this vaccine aren't yet complete either.

The trial NCT01052402 of the effects of the H5N1 influenza vaccine on infants, children and adolescents that you can view at the link below is still recruiting participants and won't be completed until August 2011!

http://clinicaltrials.gov/ct2/show/NCT01052402?term=Baxter+%2B+H5N1+%2B+vaccine&rank=9

In fact, as of this writing, Baxter hasn't even finished its Phase 3 trial of adults who have received the H5N1 influenza vaccine. The trials below won't be complete until February 2010 and November 2010 respectively. See:

http://www.clinicaltrials.gov/ct2/show/NCT00462215?term=Baxter+%2B+H5N1+%2B+Phase+III&rank=2
http://www.clinicaltrials.gov/ct2/show/NCT00711295?term=Baxter+%2B+H5N1+%2B+Phase+III&rank=1

What sorts of side effects can A/H1N1 influenza vaccines cause?

The potential side effects of Baxter's A/H1N1 influenza vaccine "Celvapan" may be read on the datasheet. Potential side effects of concern for Celvapan include sudden hearing loss, paresthesia, arthralgia (from H5N1 influenza vaccine trials) while post marketing surveillance of H1N1 influenza vaccine recipients included reports of convulsions, anaphylaxis and influenza-like illness, among other side effects, in vaccine vaccine recipients.

=>https://web.archive.org/web/20100526012255/http://www.medsafe.govt.nz/profs/Datasheet/c/Celvapaninj.pdf

NB: If you are unfamiliar with medical terms, a medical dictionary can be accessed online at: http://www.nlm.nih.gov/medlineplus/mplusdictionary.html (MedlinePlus Medical Dictionary is no longer available)

Special concerns about Baxter's A/H1N1 influenza vaccine "Celvapan". ***Could it cause cancer***?

Baxter's A/H1N1 influenza vaccine ("Celvapan") is produced in "Vero cells" which are derived from green monkey kidney tissue. => http://en.wikipedia.org/wiki/Vero_cell

Cell lines of this type have the potential to be contaminated with viruses such as Simian Virus 40 (SV40) a monkey virus of known oncogenic (tumour producing) potential. (For information about SV40 and cancer in humans please see: => https://www.sv40foundation.org/alexander/

The Minister of Health responded to a request made under the Official Information Act (OIA) by stating that the Vero cell line used by Baxter has been tested and found to be free from SV40. However, he refused to release the documents necessary to prove this assertion. (This refusal is currently the subject of a complaint to the Ombudsman.)

Moreover, the Vero cell line used to culture the A/H1N1 influenza viruses for Baxter's "Celvapan" vaccine, is a neoplastic cell line. The FDA is currently investigating whether residual DNA from neoplastic cells (like Vero cells) used in vaccine manufacture can cause cancer in vaccine recipients.

=> https://www.fda.gov/vaccines-blood-biologics/science-research-biologics/development-assays-defined-sensitivity-regulatory-management-novel-cell-substrates

The NZ Minister of Health is **aware of this risk.** However, he has no plans to cooperate "at this time" with the US FDA on research on this issue. According to the Minister, the Vero cells line used by Baxter in the production of "Celvapan" is one that minimises the possible cancer risk from the vaccine. However, he refused to release any of the documents to prove this assertion.

Moreover, he stated that the NZ Ministry of Health would not conduct independent testing of Baxter's A/H1N1 influenza vaccine prior to its use in New Zealand. Such testing could provide vaccine recipients with assurance that the vaccine is not contaminated with H5N1, SV40, any other adventitious microorganisms, oncogenic DNA fragments or any other inadvertent contaminants that

could pose a health risk. In other words, The Ministry of Health is relying solely on information supplied by Baxter – which has a massive financial interest in its products – attesting to the safety and efficacy of "Celvapan".

Does the company that the Ministry of Health chose as a supplier for A/H1N1 influenza vaccine for New Zealand (Baxter International) have a good safety record?

In 2008 Baxter produced and marketed contaminated Heparin which caused at least 4 deaths and made hundreds of other people ill.

http://www.medicalnewstoday.com/articles/99662.php (06.03.2008)

An investigation into this debacle found that Baxter was sourcing raw materials from an uncertified Chinese factory that had never been inspected by the Chinese drug regulators.

http://www.medicalnewstoday.com/articles/97598.php (16.03.2008)

In February 2009, Baxter distributed to sixteen labs in four different countries a bulk seasonal (H3N2) influenza vaccine product that was contaminated with live bird flu (H5N1) viruses. This could potentially have sparked a deadly H5N1 influenza pandemic, but fortunately staff in a Czech laboratory discovered the problem in time. (21.02.2009) =>

https://web.archive.org/web/20090302095805/http://www.torontosun.com/news/canada/2009/02/27/8560781.html

The Czech Republic subsequently refused to enter into a contract with Baxter for A/H1N1 influenza vaccine as Baxter refused to guarantee the vaccine's safety nor take responsibility for compensating recipients who might suffer side effects from the vaccine's use. (03.08.2009) =>

https://web.archive.org/web/20090822003914/http://www.ceskenoviny.cz/tema/zpravy/baxter-not-to-provide-anti-swine-flu-vaccine-to-czechs/391210

How well do influenza vaccines work to prevent illness?

Influenza vaccines have a long history of producing disappointing results in terms of preventing influenza or influenza like illness. A recent article published in the British Journal of Medicine stated that: "In children under 2 years inactivated vaccines had the same field efficacy as placebo,8 and in healthy people under 65 vaccination did not affect hospital stay, time off work, or death from influenza and its complications" - see Jefferson T. *Influenza vaccination: policy versus evidence*. BMJ. 2006 Oct 28;333(7574):912-5. doi: 10.1136/bmj.38995.531701.80.

The author also expressed surpise at the lack of safety studies: "A Cochrane Database Systematic Review found only one old trial with data from 35 participants aged 12-28 months.8 In the general population of elderly people, despite a dataset of several million observations, safety was only reported in five randomised controlled trials (2963 observations in total) on local and systemic adverse events seen within a week of giving parenteral inactivated vaccine."

He recommended that in light of the evidence poor effectiveness of inactivated influenza vaccine, poor methodology of some studies and the surprisingly small amount of information relating to vaccine safety, that a "a re-evaluation [of influenza vaccination programmes] should be urgently undertaken." see => https://www.bmj.com/content/333/7574/912.full

What lifestyle choices help reduce the incidence of influenza and its complications?

Good nutrition, getting enough sleep and keeping fit assist the immune system to function effectively. Avoiding alcohol – particularly heavy or binge drinking – is also important as consumption of large amounts of alcohol depresses your immune system.

Sufficient sun **exposure to the skin** – without wearing sunscreen – is necessary to synthesis sufficient vitamin D to keep your immune system functioning properly. (This is one of the reasons that flu is more prevalent in winter as the cold weather means people have to wear more clothing and can easily become **vitamin D** deficient.) If your lifestyle precludes sufficient time outdoors in the sun, it is a good idea to have a blood test to check your vitamin D status checked. (Estimates of how long it is necessary to spend outside in light clothing vary as it depends on the time of year, latitude and the colour of your skin, with people with dark skin requiring more sun exposure to synthesise vitamin D.) If necessary, to correct a deficiency, vitamin D3 supplements may be taken.

(These are available in both over the counter formulations and on prescription.) Prescription vitamin D tablets of high potency need to be kept out of reach of children since they are toxic if taken in excessive dosages, such as might be taken by a young child who mistakes them for lollies.

http://en.wikipedia.org/wiki/Vitamin_Dhttp://en.wikipedia.org/wiki/Vitamin_D_and_influenzahttp://www.usnews.com/health/family-health/articles/2008/06/23/time-in-the-sun-how-much-is-needed-for-vitamin-d.html

=> '*Wikipedia does not have an article with this exact name*'

If you do get the flu, it is important to ensure good hydration and to rest. **Vitamin C** taken in high dosages (the bowel tolerance method works well) from the very start of the symptoms will usually prevent the disease from becoming serious. There are a few people who have genetic conditions such as glucose-6-dehydrogenase deficiency who cannot tolerate high doses of vitamin C. (There are blood tests that can be used to determine whether or not this rare genetic deficiency is present.) In a very serious case of influenza intravenous vitamin C may be needed.

Herbal medicines can boost the immune system and help relieve symptoms. Some also have constituents that have direct antiviral activity.

NB: If you are pregnant or breastfeeding you should seek professional advice before taking high dosages of vitamin C or taking herbal medicines. You should also get professional advice if you have underlying health problems and/or are taking prescription drugs as some herbs and drugs can interact to cause adverse effects. Dr John McKenna's book "Natural Alternatives to Antibiotics" has useful information on the scientific basis of herbal medicine and is also a good guide to the wholistic treatment of infections. The link below gives traditional home remedies for cold and flu.

Holistic Remedies => https://www.holisticonline.com/Remedies/Flu/cold_herbal-remedies-for-cold.htm

As a general rule medications like aspirin or paracetamol should not be taken to reduce fever since reducing the fever can reduce the efficiency of the immune response to the virus. (Aspirin should never be given to children since there is a risk of Reyes syndrome which is potentially fatal.)

A recent review of the use of antipyretics (fever-lowering drugs) stated:

"**Antipyretics may be harmful**

Immunity: Too many parents and health workers think that infection is bad, infection causes fever, and that therefore fever is bad. In fact, fever is often a beneficial host response to infection, and moderate fever improves immunity.[11] Therefore, it may not be a good idea to give drugs that reduce temperature to patients with severe infection. I have recently reviewed 1 the results of 9 controlled trials in mammals of the effect of paracetamol or aspirin on mortality or virus excretion. Four trials found that aspirin increased mortality in bacterial or viral infection. Viral shedding was increased by paracetamol or aspirin in 3 studies, possibly increased in one, and not affected in two (one used only pharyngeal washings, and one had only 9 subjects in the aspirin and placebo groups). One study found that antibody production was impaired by both paracetamol and aspirin, but no effect on antibody production was detected in the study with only 9 subjects in the aspirin and placebo groups. This evidence suggests that aspirin and paracetamol increase mortality in severe infection, and that they may prolong the infection and reduce the antibody response in mild disease."

=> https://web.archive.org/web/20091216085511/http://www.australianprescriber.com/magazine/18/2/33/5

NB: It is important to realise the paracetamol can be fatal in overdose and to keep all products containing paracetamol (especially the attractively flavoured syrups) out of reach of children.

Homoeopathy can also be a very useful treatment for the flu. Records from the 1918 influenza pandemic shows that patients treated with homoeopathic medicine were much more likely to survive than those treated with conventional medicine. Homoeopathic medicines are safe to take while pregnant and breast feeding. =>

https://nesh.com/the-new-england-journal-of-homeopathy/vol-7-no-1-springsummer-1998/influenza-1918-homeopathy-to-the-rescue/

A new theory suggests that one of the reasons that the mortality rate was so high among conventionally treated patients during the 1918 influenza pandemic was due to doctors giving their patients *excessive doses of aspirin*. => https://pubmed.ncbi.nlm.nih.gov/19788357/

FOCUS online

Profitgier auf Kosten der Kinder

Focus, 8 February 2010

http://www.focus.de/gesundheit/baby/news/impfstoff-engpass-profitgier-auf-kosten-der-kinder_aid_478176.html

Statt Kinderimpfstoffe zu produzieren, hat der einzige Hersteller auf Pandemrix gegen Schweinegrippe umgestellt. Mediziner warnen vor dramatischen Folgen des Impfstoffmangels.

Kinderimpfstoffe sind derzeit Mangelware

Als am Wochenende bekannt wurde, dass einige Mehrfachimpfungen für Kleinkinder zurzeit nicht zur Verfügung stehen, war die Empörung groß. Zurecht, denn der einzige Hersteller GlaxoSmithKline (GSK) hat offenbar die gesamte Vakzine-Produktion auf Pandemrix konzentriert, den Impfstoff gegen Schweinegrippe. Eltern befürchten, dass ihre Kinder nun lang auf eine schützende Impfung warten müssen und sehen die Gesundheit des Nachwuchses in Gefahr.

Der akute Lieferengpass könne gravierende, sogar tödliche Folgen haben, sagte Wolfram Hartmann, der Präsident des Berufsverbands der Kinder- und Jugendärzte (BVKJ). "Besonders gefährlich für Säuglinge sind HIB-Infektionen und Keuchhusten, die so schwere Komplikationen hervorrufen können, dass sie zum Tode führen."

Kein Nachschub für den Kinderarzt

Von den entscheidend wichtigen Sechsfach- und Vierfachimpfstoffen gäbe es in den Arztpraxen entweder nur noch kleine Restbestände oder gar nichts mehr. Der Sechsfachimpfstoff schützt gegen Diphtherie, Wundstarrkrampf, Kinderlähmung, Keuchhusten, HIB-Infektion und Hepatitis B – er wird ab der achten Lebenswoche verabreicht. Babys ab dem elften Monat erhalten eine Vierfachkombination gegen Mumps, Masern, Röteln und Windpocken.

"Keuchhusten kann für Säuglinge lebensgefährlich sein, und eine HIB-Infektion kann zu Kehlkopfentzündung oder Hirnhautentzündung führen, die beide den Tod bedeuten können", erklärte Hartmann. Er wies auch Informationen zurück, dass für jede der Erkrankungen auch eine Einzelimpfung existiere. "Es gibt keinen Einzelimpfstoff gegen Keuchhusten oder eine HIB-Infektion. Entsprechende Meldungen sind falsch." Gegen andere Krankheiten wie Mumps, Masern oder Röteln seien dagegen Einzelimpfstoffe erhältlich.

Schweinegrippeschutz auf Kosten der Kinder

Der Mediziner erhob gegenüber dem alleinigen Hersteller GSK schwere Vorwürfe wegen des Produktionsverhaltens. "Die haben die Produktion des Schweinegrippe-Impfstoffs Pandemrix angenommen, weil damit viel Geld zu verdienen war und haben die Bedürfnisse von Kindern ganz hinten an gestellt." Der Mediziner zeigte kein Verständnis dafür, eine klar kalkulierbare Impfstoffproduktion für Kleinkinder derart schleifen zu lassen. "Man weiß vorab genau, welche Menge nötig ist. Diese Mengen müssen über Lieferverträge gesichert sein. Die Impfstoffe sind mehrere Jahre haltbar und können auch mühelose eingelagert werden." Wolfram Hartmann sieht aber auch die Politik mit in der Verantwortung. Die Produktion der Impfstoff-Kombinationen einem einzigen Unternehmen in Monopolstellung zu überlassen, sei falsch.

GlaxoSmithKline habe Anfang Januar die Kinderärzte auf drohende Engpässe hingewiesen, Ende Januar war es dann schon so weit, kritisierte Wolfram Hartmann. Nun sitzen dem Verbandspräsidenten zufolge schon viele Arztpraxen auf dem Trockenen. Es sei unklar, wie lange es keine Impfstofflieferungen mehr geben werde. "Bis dahin sollten Ärzte, die noch Restmengen haben, auf Auffrischungen verzichten, um stattdessen noch Erstimpfungen für Säuglinge zu ermöglichen", empfiehlt der Mediziner.

Paul-Ehrlich-Institut rät zu Alternativimpfungen

Beschwichtigend äußerte sich dagegen das Paul-Ehrlich-Institut (PEI) in Langen unter Berufung auf Angaben des britischen Herstellers GlaxoSmithKline (GSK). Einige der nicht mehr lieferbaren Impfstoffe für Kinder dürften bereits in rund einer Woche wieder zur Verfügung stehen.

THE FLU CASE

Controlled media tries to limit damage of swine flu vaccine scam

The Flu Case, 8 February 2010 15:20

https://web.archive.org/web/20100220013517/http://www.theflucase.com/index.php?option=com_content&view=article&id=2712%3Acontrolled-media-tries-to-limit-damage-of-swine-flu-vaccine-scam&catid=1%3Alatest-news&Itemid=64&lang=en

The swine flu vaccination scandal has led to growing scepticism among people in Europe towards all vaccinations, forcing Big Pharma and the controlled media to think of ever new strategies to limit the damage.

Germany's controlled media has recently been flooded with reports about how pharamceutical companies produced huge quantities of swine flu vaccines for profit -- leaving a dangerous lack of other vaccines for children. The implication is that these vaccines are safe and desirable.

A typical report is carried by Focus, one of the main drivers of the swine flu hysteria, and headlined: "Vaccine shortage: Profitgreed at the cost of children."

2 NYHETENE

Svineinfluensavaksine kan ha tatt livet av 14 fostre

TV 2 Nyheter, 17 February 2010 12:14

https://www.tv2.no/nyheter/innenriks/svineinfluensavaksine-kan-ha-tatt-livet-av-14-fostre/12612260/
https://web.archive.org/web/20100220103754/http://www.tv2nyhetene.no/innenriks/helse/svineinfluensavaksine-kan-ha-tatt-livet-av-14-fostre-3139153.html

14 aborter og dødsfødsler kan ha blitt forårsaket av svineinfluensavaksine.

Statens Legemiddelverk og Folkehelseinstituttet er bekymret over mulige bivirkninger av vaksinen for mor og barn.

Kan ha tatt liv

I høst satte norske helsemyndigheter i gang et stort eksperiment: gravide skulle være førsteprioritet i køen for svineinfluensa-vaksine.

70 prosent av de gravide vaksinerte seg. Nå viser det seg at vaksinen kan ha tatt liv.

21 dødfødsler og aborter

Norske leger har innrapportert 21 dødfødsler og spontanaborter som de frykter skyldes vaksinen. Over halvparten av dem var kommet halvveis i svangerskapet.

– Noen kan vi utelukke at har noe med vaksinen å gjøre, fordi forsteret har hatt andre alvorlige sykdommer som ikke kan ha sammenheng med vaksinen. Men i noen tilfeller har vi ikke nok opplysninger til å si det 100 prosent sikkert, sier avdelingsoverlege Steinar Madsen i Statens legemiddelverk til TV 2 Nyhetene.

– Fantes det noen kliniske studier om bivirkningene hos gravide?

– Nei, ikke på denne vaksinen, sier Madsen.

Vil undersøke

– Dette må vi finne ut av. Det er alvorlig hvis noen er usikre på om vaksineringen var årsaken til noe så alvorlig. Da er vi nødt til å komme til bunns i det, sier Bent Høie (H) som er leder i Stortingets helsekomite.

Statens Legemiddelverk og Folkehelseinstituttet vil sette i gang en studie som skal omfatte alle de gravide som ble vaksinert.

Vil ikke betale

Studien vil koste 20 millioner kroner, men det vil ikke Helsedepartementet betale, til tross for at de selv var med på beslutningen om å vaksinere gravide mot svineinfluensa.

– Dette enkeltstående prosjektet har ikke vi i dag penger til. Men vi får håpe at det er andre innen forskningsområdet i Norge som finner finansieringtil prosjektet, sier statssekretær Roger Ingebrigtsen (Ap) i Helse- og omsorgsdepartementet.

Bivirkninger

Legemiddelverket mener behovet for undersøkelser er stort. 14 dødfødsler og spontaborter må undersøkes for å avdekke om de er forårsaket av vaksinen.

Dessuten kan barna som ble vaksinert i mors mage fått bivirkninger av vaksinen, som lav fødselsvekt.

THE FLU CASE

Norwegian medicines agency to launch study on swine flu jab's impact on pregnant women

Swine flu vaccine may have taken the lives of 14 fetuses

The Flu Case // TV 2 Nyheter, 18 February 2010

https://web.archive.org/web/20100301035919/http://www.theflucase.com/index.php?option=com_content&view=article&id=2779%3Anorwegian-medicines-agency-to-launch-study-on-swine-flu-jabs-impact-on-pregnant-women-&catid=41%3Ahighlighted-news&Itemid=105&lang=en

14 abortions and fatal birth may have been caused by the swine flu vaccine.

Norwegian Medicines Agency and of Public Health is concerned about the possible side effects of the vaccine for mother and child.

May have life

In autumn, the Norwegian health authorities started a great experiment: pregnant women should be first priority in the queue for the swine flu vaccine.

70 percent of pregnant women vaccinated themselves. Now it turns out that the vaccine may have cost lives.

Will examine: Medicines Agency believes the need for research is huge. Steinar Madsen is an expert the Norwegian Medicines Agency.

Norwegian doctors have reported 21 stillbirths and miscarriages as the fear caused by the vaccine. More than half of them had come halfway through the pregnancy.

"Some can we rule out that has something to do with the vaccine, because the patients have had other serious diseases that can not be related to the vaccine. But in some cases we have not NOK information to say it 100 percent safe, "said Steinar Madsen in the Norwegian Medicines Agency to TV 2 news.

"Were there any clinical studies about the side effects in pregnant?"

"No, not at this vaccine, "says Madsen.

Will examine

"We need to find out. It is serious if someone is unsure whether vaccination was the cause of something so serious. When are we going to have to get to the bottom of it, "says Bent Høie (H) who is head of Parliament's health committee.

Norwegian Medicines Agency and of Public Health will launch a study that will include all the pregnant women who were vaccinated.

Will not pay

The study will cost 20 million, but it will not pay the Ministry of Health, despite the fact that they took part in the decision to vaccinate pregnant women against swine flu.

"This single project does not have our present money. But we can only hope that there are others within the research area in Norway which help finance the project," says State Secretary Roger Ingebrigtsen (Ap) in Health and Care Services.

Side effects

Medicines Agency believes the need for research is huge. 14 stillbirths and spontaborter must be examined to determine whether they are caused by the vaccine.

Moreover, children who were vaccinated in the mother's womb had side effects of the vaccine, such as low birth weight.

THE FLU CASE

Rise in disabled children in Bosnia following use of Bill-Gates funded vaccines,
reports Jagoda Savic

The Flu Case, 23 February 2010, 17:53
https://web.archive.org/web/20100301040154/http://www.theflucase.com/index.php?option=com_content&view=article&id=2809%3Arise-in-disabled-children-in-bosnia-following-use-of-bill-gates-funded-vaccines-reports-jagoda-savic&catid=41%3Ahighlighted-news&Itemid=105&lang=en

The Association of Parents of Disabled Chidren from Bosnia and Herzegovina has filed criminal charges on January 18th, 2010, with a state prosecutor over the failure to investigate vaccine damage to children linked to vaccines financed by the GAVI. (the Global Alliance for Vaccines and Immunisation),

The charges maintain that state prosecutor Sead Kreštalica assisted members of the Federal Institute for Public Health in evading investigation for their role in the UNICEF's GAVI vaccination programme against hepatitis b, which is believed to be responsible for the increase in the number of disabled children in Bosnia and Herzegovina since 2002.

The GAVI office, located inside the World Health Organization, launched a vaccination campaign against liver infectious disease among children that was financed with a $1.5 million grant from the Bill & Melinda Gates Foundation made to more than 20 governments.

In 2002, the epidemiology office of the Bosnian Federal Institute for Public Health put forward plans to vaccinate all newborn healthy babies against hepatitis b in first 24 hours of life within the framework of the GAVI vaccination campaign.

In 2002, only nine other countries in the world vaccinated all newborn healthy children against hepatitis b in first 24 hours of life: Bulgaria, Estonia, Latvia, Litthuania, Poland, Portugal, Rumunia, Turkey and Spain.

The hepatitis b virus does not spread as an epidemic and the virus is transmissing by needles, sexual contacts and human liquids.

UNICEF advisor was Dr Popov from Bulgaria, who appeared to have no experience in epidemiology, according to the former chief federal epidemiologist Prof. Zlatko Puvačić (See „Express" on 19. 06. 2002).

The GAVI vaccines seem to be connected with enourmous increase of disabled children in Bosnia and Herzegovina from 2002.

Disabled children who underwent an laboratory analysis were found to have unusually high amounts of of mercury in their hair nails and urine.

In Bosnia, newborn babies have been vaccinated only with BCG vaccine in the past 50 years and there have been no visible health problems due to the BCG vaccine.

The addition of the vaccine against hepatitis b was added to BCG in first 24 hours of life has resulted in babies receicing vaccines with two doses of mercury in the vaccine's preservative, thiomersal. The increase in the mercury appears to have affected the capacity of babies to excrete mercury from their bodies and created basis for cumulative effect of mercury in their bodies.

Small babies have no capacity to produce a bile, which is main way of excretion of mercury from the body. Also, small babies have limited capacity to produce glutation , which is the main detoxicant of the brain.

There is a correlation between a timing of the vaccines given in later months of life and the quantity of mercury found in childrens' bodies and it shows cumulateve effect of mercury.

Children in Bosnia and Herzegovina have undergone a severe neurological deterioration. Some children lost the ability to walk, to sit down, to eat with a spoon, to talk: they have motoric and intellectual retardation and some of them have got encephalopathy, epilepsy and autism. The Association has 117 registered cases, but according to other organizations who are concerned with children with special needs, it seems that there are more than 1100 child victims of GAVI vaccines.

Parents presented 41 requests for laboratory analysis, neurological , toxicological and genetics expertise to the Cantonal prosecution in Sarajevo but the request went answer.

The vaccine used, euvax b, until 2002 has been licenced in 30 countries: 1994-Bangladesh, Filipini, 1995-Argentina, Guatemala, Korea, Myanmar,1996-Equador,1997-Urugvay,1998-Tailand, Armenia, Azerbejdžan, Georgia, Iraq, 1999-Costa Ricca, Jamaica, Trinidad and Tobago, Kirgistan, Uzbekistan, 2000-Chile, Dominikan Republic, Peru, Pakistan, Turkey, Mauritania, Togo, 2001-Aruba (Antili), Paragvay, Moldavia, Jordan and Gabon.

On 07. 08. 2001, Bosnia and Herzegovina became the first and, at that time, the only one country in Europe to licence this vaccine.

In 2002 the pharmaco- kinetic proprieties and duration of protective effect on healthy people of Euvax B were not known.

Parents in Bosna received no information on clinical studies on babies and no information in which countries, when and on which subjects, clinical tests has been conducted. Parents also received no information on the vaccine's pharmaceutical, chemical, biologicical, microbiological and virology or pharmaceutical toxicology.

Nevertheless, WHO in November 2000 declared this vaccine as accepetable for UN agencies. A producer of euvax b is LG from South Korea, better known as producer of TV and other electronic equipment. The distributer of euvax b is "Sanofi Aventis".

WHO temporarily suspended the use of specific lots of the Euvax B vaccine in 2007 following evidence that it was linked to the deaths of infants in Viet Nam.

Investigation of adverse events following Euvax B (hepatitis B) vaccination, May-July 2007
https://web.archive.org/web/20090726225235/http://www.who.int/immunization_safety/aefi/investigations_EuvaxB_synopsis/en/print.html

Synopsis and final outcome
From May to July 2007, WHO assisted the government of Viet Nam in the investigation of four serious adverse events (including three deaths) in infants following administration of Euvax B (hepatitis B) vaccine. As a precautionary measure pending investigation of the reported cases, the Department of Immunization, Vaccines and Biologicals (IVB) at WHO recommended on 15 May the temporary suspension of the distribution and use of specific lots of Euvax B vaccine and provided guidance for parallel actions to be taken at country level. Following investigation of the reported cases from Viet Nam and additional reports from other countries as well as vaccine quality testing and a review of the batch records and manufacturing and quality control process at the manufacturing site, no evidence of a quality problem with the vaccine was found. Consequently, on 7 July 2007, WHO removed its recommendation for temporary suspension of specific lots of Euvax B vaccine and recommended that all lots of Euvax B under temporary suspension be released for use. At no time during the investigation was Euvax B vaccine removed from the WHO list of prequalified vaccines.

Background
Euvax B vaccine
Euvax B is a recombinant DNA hepatitis B vaccine derived from hepatitis B surface antigen (HBsAg) produced by DNA recombinant technology in yeast cells (Saccharomyces cervisiae). HBsAg

is absorbed onto aluminium salts as an adjuvant and preserved with thiomersal. Other excipients are potassium phosphate monobasic, sodium phosphate dibasic and sodium chloride. The vaccine is manufactured by LG Life Sciences, based in the Republic of Korea. The vaccine was prequalified by WHO in November 1996. As at May 2007, approximately 254 million doses had been distributed through UN agencies.

WHO response and initial recommendations

Following the reports of serious adverse events (including three deaths) in Viet Nam, and initiation of an investigation, WHO recommended, on 15 May 2007, the temporary suspension of the distribution and use of specific lots of Euvax B vaccine. This action was taken as a precautionary measure pending the full investigation of the reported adverse events. WHO recommended that, until further notice, there be no further distribution or use of specific Euvax B vaccine lots produced from the same final bulk as lots that had been supplied through the UN system to Viet Nam and were under investigation.

The recommendation was limited to specific bulks and corresponding final lots (further updated on 25 May 2007):

Bulk UVN05012 and related lots UVX05027, UVX05028 and UVX05029
Bulk UVN06004 and related lots UVX06005, UVX06006 and UVX06007
Bulk UVN05014 and related lots UVX05030, UVX05031, UVX05032, UVX05033, UVX05034

At the time of suspension, there was no indication of a vaccine quality problem with specific lots of Euvax B, or with the vaccine in general.

WHO recommended that countries continue to provide hepatitis B vaccination, including the birth dose where applicable, using other lots of Euvax B not affected by the temporary suspension (and where already the case, other hepatitis B vaccines).

WHO and UNICEF urged countries not to suspend all use of Euvax B and/or use of other hepatitis B vaccines for the birth dose or other scheduled vaccination without careful risk-benefit considerations. These considerations included a careful analysis of any potential risks of concern in the specific country and a thorough assessment of the potential negative impact on hepatitis B vaccine supply and acceptance in both the short- and long-term. It was emphasized that the suspension of hepatitis B birth dose vaccination had major implications at it would mean that many infants would be at high risk for becoming hepatitis B carriers and at risk for premature death.

As a precautionary measure, the vaccine manufacturer, LG Life Sciences, and one of its international distributors, sanofi pasteur SA, also issued advice of a temporary suspension on the distribution and use of the same batches of the vaccine specified in the WHO recommendation.

Investigation of reported AEFI cases

Viet Nam

The three deaths and one other serious adverse event which followed vaccination of infants in April and May were investigated by the national authorities with support from WHO. A detailed expert review of the clinical data and assessment of probable causes was carried out at the request of WHO.

The death of one infant (in Ho Chi Minh City) was determined to be unrelated to the vaccine. This conclusion was based on autopsy findings of an acute myocardial infarction secondary to coronary artery thrombosis occurring in utero.

The clinical picture in the two other fatal cases (in Ha Tinh province) was consistent with acute shock with several possible aetiologies. Among the possible aetiologies, endotoxic or anaphylactoid shock were considered to be the most likely. (Anaphylaxis - or anaphylactic shock - a different clinical condition from anaphylactoid shock, is exceedingly rare in neonates and was not considered a likely aetiology in these cases). However, no evidence was found to support or rule out programmatic

error (such as contamination of the vaccine, or inadvertent administration of a wrong drug) that would explain these two possible aetiologies.

In the fourth case (in Thanh Hoa province), the cause of the AEFI was found to be most likely a pneumonia or sepsis/bacteraemia, with no definite conclusion to rule out or confirm a relationship to the administration of the vaccine.

Thus, one case was confirmed as a coincidental AEFI, while for the remaining three the information available did not confirm or rule out a possible link with the vaccine or vaccination.

Other countries

All reports of serious AEFI of which WHO was made aware were followed up and a vaccine quality problem ruled out. Investigation of three serious AEFI cases which followed concurrent administration of Euvax B and other vaccines did not provide evidence of a link between the AEFIs and Euvax B vaccine.

Vaccine quality review and testing

Samples of the suspended vaccine lots, collected from the manufacturer and from Viet Nam, were tested for bacterial endotoxins, abnormal toxicity and pyrogen by a WHO-contracted laboratory. Final test results showed that the lots complied with the quality specifications as recommended by WHO, the European Pharmacopeia and the Korean Pharmacopeia.

In conjunction with the Korea Food and Drug Administration (KFDA), a WHO team conducted a site visit to LG Life Sciences at the end of May to review the batch records and manufacturing and quality control process of the vaccine. The report of this visit, and a subsequent review of this report by an ad hoc expert committee convened by WHO, provided consistent conclusions that there were no problems with regard to the quality, safety or potency of the Euvax B vaccine.

The KFDA also tested samples of the vaccine lots (from the suspended bulk batches) distributed and used in the immunization programme in the Republic of Korea. Results showed compliance with WHO quality standards.

Conclusions and final recommendations

The clinical, epidemiological and multiple vaccine quality investigations provided no evidence of a quality problem with specific lots of Euvax B, or with the vaccine in general. Specifically, vaccine quality testing by the independent WHO-contracted laboratory showed the tested lots to be compliant with the quality specifications as recommended by WHO, the European Pharmacopeia and the Korean Pharmacopeia.

On the basis of the above findings, WHO removed, on 7 July 2007, its recommendation for the temporary suspension of specific lots of Euvax B vaccine. Further, WHO recommended that all lots of Euvax B under temporary suspension be released for use. National regulatory authorities and immunization programme managers were advised to take appropriate care, prior to releasing affected vaccine lots for use, to ensure that the relevant lots had been stored under recommended conditions while on hold.

At no time during the investigation was Euvax B vaccine removed from the WHO list of prequalified vaccines. In this investigation, the possibility of a link with the vaccine or vaccination could not be confirmed or ruled out in three of the four serious AEFI cases. As a result of background mortality due to other causes, deaths among neonates and infants reported following vaccination may be coincidental, in other words having only a temporal association with the vaccine(s) administered. Hence careful investigation of serious adverse events is critical.

Hepatitis B vaccination

Hepatitis B vaccine is highly effective in preventing hepatitis B virus infection. Failure to vaccinate infants increases the risk of chronic infection, that can lead in later life to liver disease (including cancer) and early death. WHO and UNICEF recommend that all infants in all countries receive hepatitis B vaccine, with the first dose provided at birth in areas where mother-to-child hepatitis B virus transmission is significant.

US groups lays groundwork to sue over Swine Flu jab Miscarriages

Progressive Convergence, 9 March 2010, 14:24
https://web.archive.org/web/20100327201512/http://www.progressiveconvergence.com/H1N1-RELATED%20miscarriages.htm
https://web.archive.org/web/20100525025702/http://www.theflucase.com/index.php?option=com_content&view=article&id=2959%3Acdc-starts-evaluation-of-swine-flu-vaccine-experiment&catid=1%3Alatest-news&Itemid=64&lang=en

Eileen Dannemann, Director, National Coalition of Organized Women, is preparing the documentation *to sue over miscrarriages caused by the swine flu vaccine*.

"We have documented so far 200 miscarriage cases after the administration of the H1N1 vaccine," she writes.

"We already have 10 signed affidavits and notations on the amount of thimerosal to body weight of the fetus.

Although the CDC has reduced or removed thimerosal in the children's vaccine program, the flu shot, seasonal and H1N1 has high levels of thimerosal in the multidose and trace in the single dose.

If the question is whether the drug could have been betterâ€¦.it could have NOT contained Thimerosal. See our documentation:

THE FLU CASE

$70 dollar bribe to get US girls to take dangerous Gardasil jab

The Flu Case, 16 March 2010, 10:22

https://web.archive.org/web/20100325183341/http://www.theflucase.com/index.php?option=com_content&view=article&id=3026%3A70-dollar-bribe-to-get-us-girls-to-take-dangerous-gardasil-jb&catid=41%3Ahighlighted-news&Itemid=105&lang=en

Crooked campaign hits mall-loving teens

Forget shady strangers and bags of candy... the biggest threat to our daughters and granddaughters comes from health officials armed with mall gift certificates.

In one of the most irresponsible government programs I've ever heard of, clinics in Birmingham, England, are bribing teenage girls to get vaccinated.

Believe it or not, they're offering girls up to $70 in "Love2Shop" mall vouchers in exchange for getting one of the most dangerous vaccines ever approved: Gardasil.

They call this an incentive; I call it physical assault on a minor. They want a pat on the back; I want them pat down and tossed in jail.

And if, as a parent, you don't like it... tough. In Jolly Old England, your daughter doesn't need your permission to get vaccinated... so you'll only find out when she comes home showing off her new earrings... or when you get a call from the emergency room after she suffers one of this dangerous drug's many side effects.

I've been crusading against Gardasil from Day One. The media calls it a "cervical cancer vaccine," but don't be fooled by this fancy nickname. This vaccine doesn't protect against cervical cancer - it protects against certain forms of HPV, an STD that can cause cervical cancer.

It's far from 100 percent effective, and it's even farther from 100 percent safe. But do you expect these teenage girls to know that? Do you think they're going to go home and do the research before accepting their shopping bribe?

Sadly, most of them have no clue that Gardasil has been linked to dozens of deaths and thousands of reactions ranging from anaphylactic shock and grand mal seizures to coma and paralysis. Some girls have come down with the incurable nerve disorder Guillian-Barre Syndrome after getting vaccinated, as I've warned before.

And according to a stomach-turning report I found in the Daily Mail, officials in Britain are already talking about expanding the Birmingham mall scheme nationwide.

If you think this won't happen here, you're only partly right. Health officials might not be bribing girls at shopping malls, but the approach they're taking could be far more devastating.

Big Pharma is hard at work pressuring local officials across the country into making HPV vaccines a requirement for school.

The worst part is that all of this hoopla is over something that's completely preventable. Vaccine or no vaccine, the only surefire 100 percent effective means of preventing HPV infection is abstinence. You can't spread a sexually transmitted virus without sex. It's as simple as that.

The Korea Herald

Lee Ji-yoon

Boy paralyzed after flu shot

The Korea Herald, 30 March 2010, 12:52
https://www.koreaherald.com/view.php?ud=20091124000032

The case of a 16-year-old boy who showed signs of paralysis after recieving the H1N1 flu vaccine has prompted an investigation, health officials said yesterday.

According to the National Disaster Prevention and Countermeasures Headquarters, the teenage boy started displaying dizziness right after the injection on Nov. 16 and was moved to a hospital two days later as his arms and legs became paralyzed.

Health officials said that further tests should be conducted to confirm the exact cause of his paralysis, adding that his condition has improved.

The symptom, called the Guillain-Barre syndrome, is usually triggered by acute infection. But it is also known as a very rare side-effect of regular influenza vaccines, with an incidence of about one in 1 million.

According to the World Health Organization, only 10 GBS cases have been reported worldwide among nearly 65 million people in 40 countries confirmed to have been inoculated with the flu vaccine.

The majority of patients regain full functional capacity with prompt treatment. However, experts say, death may occur if severe pulmonary complications and autonomic nervous system problems are present.

As of Saturday, some 2.75 million people, including 2.46 million students, have been vaccinated here against the flu virus, health officials said. The nation`s second round of vaccinations are expected to inoculate about 7.5 million children and teenagers with a one-shot flu vaccine by early next month.

Measles Resurgence Tied to Parents' Vaccine Fears

NPR, 5 April 2010.
https://web.archive.org/web/20100422212108/http://www.npr.org/templates/story/story.php?storyId=125570056

A generation ago, up to 4 million U.S. children got measles every year. Hundreds died, and thousands were left with permanent brain damage. Thanks to vaccination, those days are over, at least in this hemisphere. But health officials worry about the growing number of children who are vulnerable when somebody brings measles from another part of the world.

It happens regularly. Vancouver is trying to contain a measles outbreak sparked when foreign travelers visited for the Olympics, carrying two different measles viruses from Asia.

The first recognized infections – in two Canadians and a visiting American – occurred around the Olympic closing ceremonies. "Downtown Vancouver was shoulder-to-shoulder on many days of that period," notes Dr. Monika Naus of the British Columbia Centre for Disease Control.

So far, measles has spread to 16 people in Vancouver, Naus says. Half of them are in one large unvaccinated household. The parents reject vaccination.

"It's not a religious issue," Naus says. "A friend of the family who had anti-vaccination sentiments was influential in convincing them not to get vaccinated."

Many parents who refuse to get their children vaccinated worry that vaccines – and the one for measles, mumps and rubella in particular — cause autism. It's a belief that persists despite years of studies and expert panels that find no scientific link.

Health officials say there are growing pockets of vaccine refusers in communities across the land. The numbers are not great. But these pockets of "intentionally unvaccinated" children give the virus more opportunities to spread when it does arrive.

And even if the number of measles cases in each outbreak is kept small, the arrival of measles disrupts lives and forces public health officials into high gear to contain the damage.

Ask Karen Waters-Montijo, chief of immunization at the San Diego County health agency. She and her colleagues, including officials at the U.S. Centers for Disease Control and Prevention in Atlanta, write about the impact of a 2008 measles outbreak in the April issue of the journal *Pediatrics*.

Waters remembers the February day when a public health nurse called to report a confirmed case of measles: a 7-year-old boy who had picked up the virus during a family trip to Switzerland.

As unlikely as it seems, Switzerland is one of those European countries where measles vaccination rates have fallen considerably below 95 percent – the level public health officials say is necessary to prevent measles from circulating in the community.

When Waters heard about the case, she says, "I just about fell off my chair. The child had two siblings, attended public school. The family wasn't vaccinated. And in fact, there were a lot of unvaccinated children at the school, as well."

They were "intentionally unvaccinated," meaning their parents had filed Personal Beliefs Exemption forms to opt out of the vaccinations that are required for schoolchildren. Parents of almost 10 percent of the students at Patient Zero's school had signed PBE forms.

That may not sound like much. But no virus is more contagious than measles. "If a measles-infected person walks into a room with 10 uninfected people," says Dr. David Sugerman of the CDC, "nine of them will get infected."

Moreover, anyone who goes into that room within the next two hours after the infected person has left is likely to get measles, too.

So Waters and her colleagues were alarmed when they learned that it had taken a week before the measles infection of Patient Zero was diagnosed. In the meantime, he had exposed many people in doctors offices and clinic waiting rooms, as well as in school. He had also infected his siblings, and they had exposed many others.

"It was slow to be recognized, and there's a good reason for that," Waters says. "We hardly ever see any measles cases. Most doctors have never seen a case." Once the first patient was diagnosed, moreover, health authorities were slow to be notified.

Once they found out, health authorities kicked into gear, tracing everybody who came into contact with the first cases – and everybody who was in contact with them. That net captured people who got exposed (and, in some instances, infected) at supermarkets, circus performances, fairgrounds and a Hawaii-bound airplane.

It added up to 839 people. Of those, 73 were unvaccinated children – 25 whose parents chose not to get them vaccinated, and 48 children under 12 months who were too young to be vaccinated.

To limit the spread of the virus, San Diego County officials asked parents of those 73 children to keep them at home. Many of them were pretty unhappy about that.

"Imagine, you start off on a normal day," Waters says, "and you're getting ready to drop your child off at their child care place, and you're greeted by a public health nurse who says your child has been exposed to measles, and we'd like you to go home and be there for the next three weeks while we monitor you for symptoms."

Parents of exposed children who believed in vaccination were incredulous and angry, she says: "They said, 'What do you mean, people don't get vaccinated? Why is this happening?' "

In the end, the San Diego outbreak was confined to a dozen children. No big deal, you might think – except that it upended a lot of lives, and the county spent $10,000 for each of those cases in order to keep the virus from spreading more widely. That, and the fact that more than 95 percent of the general population was immune, kept the outbreak far more limited than the previous San Diego measles outbreak in 1991, when there were 1,000 cases and three deaths.

Afterward, Waters and her colleagues looked into who the vaccine refusers were and what their attitudes toward vaccination were.

They're college educated, higher-income and believers in the power of a "natural" lifestyle – things like organic food and prolonged breast-feeding – to keep their children's immunity strong enough to ward off vaccine-preventable diseases.

And they just don't believe it when government officials like Karen Waters say vaccines don't cause autism.

"It is wrapped up in their attitudes about government," Waters says. "I don't think they think I'm the enemy. I think they think I'm well-intended but misinformed."

Many communities have pockets of vaccine refusers. So the United States and other countries with growing numbers of "intentionally unvaccinated" people are likely to see more outbreaks.

There's bound to be occasional importation of measles from countries with circulating virus. These aren't only developing nations; they include Ireland, Germany, Israel, Japan and the United Kingdom, where measles had been eliminated until large numbers of parents started opting out of vaccination programs.

CDC officials are watching the Vancouver outbreak closely, as neighboring Washington state has sizable populations of vaccine refusers.

"If measles crossed the border into those populations, there's a potential for a sizable outbreak," says Dr. Jane Seward of the CDC.

Back in San Diego, Karen Waters is still trying to persuade skeptical parents to get their children vaccinated. She says refusers are not bad guys in this drama.

"You know, these are very nice people," she says. "They care a lot about children, as I do. We all want safe vaccines. We all want healthy children, and we all want answers about autism. It's unfortunate there's a group of people who are off on this track, that believe vaccines are at the root of this problem."

So far Waters hasn't changed many minds. She knows of a thousand families who have refused to get their kindergartners vaccinated. That's 100 more since that last San Diego measles outbreak.

BREITBART

China faces new health scare over 'bad vaccines'

Breitbart, 7 April 2010, 9:36 am US/Eastern

https://web.archive.org/web/20100410090509/http://www.breitbart.com/article.php?id=CNG.1b07d1be69ebdf895fab113ba26ecde7.321&show_article=1

(AFP) Four years ago, Qiang Qiang was a healthy boy. Now, he is epileptic and has trouble keeping up at school – problems that emerged after a vaccination against Japanese encephalitis.

The seven-year-old is one of dozens of youngsters in the northern Chinese province of Shanxi whose parents believe their children may have suffered serious side effects from vaccines in the country's latest public health scare. "His teacher at school tells us he is dumb, that he has short memory and cannot follow classes," his father Gao Changhong told AFP. "We have spent nearly 60,000 yuan ($8,800) to try to cure him, and we really hope the government will take this situation seriously."

A Chinese state media report last month said four children had died and more than 70 others in Shanxi fell ill after they received shots against illnesses such as hepatitis B and rabies between 2006 and 2008.

The China Economic Times report blamed vaccines that had been exposed to excessive heat and should have been destroyed. The report quoted Chen Tao'an, a whistleblower at Shanxi's Centre for Disease Control (CDC) where the vaccines were being handled, as a key source.

China's health ministry initially investigated reports of bad vaccines in Shanxi in 2008 and found no problems. But a probe of the latest allegations indicated issues with "management" of the vaccines, though the shots themselves were not faulty when first produced, the health ministry said Tuesday. It however insisted that the vaccines were not responsible for the four deaths.

According to the World Health Organisation, vaccines that are exposed to high temperatures can lose their effectiveness and trigger reactions.

Shanxi's CDC admitted in a press briefing in March that its former director had been dismissed following irregularities in his ties with the vaccine firm at the heart of the scandal. But it has insisted its shots were safe. The allegations have triggered yet another health scare in a nation regularly plagued by food and medicine-related product safety concerns.

In the past few weeks alone, authorities have ordered inspections of cooking oil nationwide after reports said up to one-tenth of China's supplies contained cancer-causing agents. Peddlers in the central province of Hunan have also reportedly been found soaking dry soybeans in green dye and selling them as fresh green beans.

And according to state media, a drug firm in the eastern province of Jiangsu has been accused of using an additive in a rabies vaccine that allowed it to meet inspection standards at a lower cost but compromised its potency. The State Food and Drug Administration has admitted that "inferior materials" were used in producing the rabies vaccines. It said the firm had been ordered to halt production and some employees were suspected of criminal activity.

The parents of the children in the Shanxi case are convinced their children were harmed by faulty shots. Wang Mingliang lost his baby son after he received a vaccine against hepatitis B. Xiao'er soon began suffering from spasms and breathing difficulties – he died months later.

"We spent more than seven months trying to get him well, from Western medicine to traditional Chinese medicine, and none of it worked," he told AFP. "None of the hospitals we went to managed to find a cause for his illness, and that's when we started suspecting the vaccine."

China has launched a high-profile product-safety blitz in recent years after a string of scares.

But scandals have continued, including revelations that the industrial chemical melamine was added to milk supplies in 2008. At least six babies died and 300,000 were sickened as a result, according to the government. => the same text

INDEPENDENT

China vaccine scare revives product safety fears

Independent, 10 April 2010, 00:00 BST
https://www.independent.co.uk/life-style/health-and-families/china-vaccine-scare-revives-product-safety-fears-5533770.html

Four years ago, Qiang Qiang was a healthy boy. Now, he is epileptic and has trouble keeping up at school - problems that emerged after a vaccination against Japanese encephalitis.

The seven-year-old is one of dozens of youngsters in the northern Chinese province of Shanxi whose parents believe their children may have suffered *serious side effects from vaccines* in the country's latest public health scare.

"His teacher at school tells us he is dumb, that he has short memory and cannot follow classes," his father Gao Changhong told AFP.

"We have spent nearly 60,000 yuan (8,800 dollars) to try to cure him, and we really hope the government will take this situation seriously."

The Sydney Morning Herald

Fevers in 60 children linked to flu vaccine

The Sydney Morning Herald, 23 April 2010, 4:42PM
https://www.smh.com.au/national/fevers-in-60-children-linked-to-flu-vaccine-20100423-tinv.html

More than 60 West Australian children may have had adverse reactions to the flu vaccine, the state's health department says.

West Australian Health Minister Kim Hames announced yesterday that vaccinations for children under the age of five would be halted after a number of reactions to the three-strain vaccine, which includes swine flu.

Australia's chief medical officer Jim Bishop today said health professionals nationwide should immediately stop immunising children under five with the vaccine, as a precaution.

West Australian Health Department chief health officer Tarun Weeramanthri said a higher-than-expected number of reactions to the vaccine, which is offered free by the state government to children under five, had been reported.

The Princess Margaret children's hospital (PMH) had reported 44 children under 10 had presented with febrile convulsions, of which 23 related to the paediatric flu vaccine.

Of the 23 children, 12 were admitted to hospital.

One child is in a critical condition following their reaction to the vaccine.

Dr Weeramanthri said he had few details on the child's condition but that they were "seriously ill".

The average age of children who had reactions to the vaccine was about two years, but children aged between five and 10 also experienced fevers and convulsions.

Dr Weeramanthri said another 40 children under 10 had been taken to other hospitals in the state with febrile convulsions, and work was being done to assess if there was a link to the vaccine.

"Advice from West Australian clinicians has said that there is a consistent clinical picture that they're seeing, with fever and vomiting around six hours and certainly within 12 hours of vaccination," he said.

The West Australian health department is working with other states and territories to compile data, but there have been no reports of a spike in reactions to the vaccine in other states.

"It's important to get an estimate of both how many have been vaccinated and how many children have potentially had reactions," Dr Weeramanthri said.

The department and the Therapeutic Goods Administration had honed in on what they thought the cause of the increased reactions was, Dr Weeramanthri said.

"The Therapeutic Goods Administration is working with the manufacturers on two lines of inquiry," he said.

"One is the data from around the country about where we're getting any signals of increased reactions and which batches went where.

"The second is to actually directly test the batches held by the various manufacturers for any impurities."

There had been no reports of an increased reaction rate to the single pandemic swine flu strain vaccine.

"So whether this is an issue about the combination of antigens … in this vaccine, which has three parts compared to a single vaccine, is something that TGA is looking at," Dr Weeramanthri said.

"That's the first time that particular antigen has been included, but one must remember that the strains of flu change regularly and so there are regular changes in the formulation of the flu vaccine."

The West Australian Health Department had responded appropriately to the reaction and in a timely fashion, Dr Weeramanthri said.

"As soon as we got information from clinicians, particularly at PMH this week that they were concerned they were seeing something more than what they normally see, and people have to understand there is a normal incidence of febrile reactions after vaccination in children.

"Once we got that information we acted as promptly as we could."

National Centre for Immunisation Research and Surveillance clinical research head Professor Robert Booy said the experience was that children around Australia had demonstrated a good tolerance for the vaccine.

Dr Weeramanthri said he was hopeful a safe vaccination program could be provided once the safety of the vaccine could be ensured.

Case in South Australia

One young child has suffered a convulsive reaction to the seasonal flu vaccine in South Australia, health officials say.

But chief medical officer Paddy Phillips said it was still to be determined if one or more components of the vaccine were the cause of the South Australian case and the spike in cases reported in Western Australia.

There's no evidence at all that there's any particular linkage, at this stage, to any of the components because we don't even know if it's absolutely linked to the vaccine," Professor Phillips said.

"Clearly there's a suspicion and that's why we're playing it safe and suspending the vaccine for five and unders."

Professor claims flu vaccine trials should have been an early warning

AM, Australian Broadcasting Corporation, 28 April 2010, 6:29 am
https://www.abc.net.au/listen/programs/am/professor-claims-flu-vaccine-trials-should-have/414128
https://www.abc.net.au/listen/programs/am/professor-claims-flu-vaccine-trials-should-have/414128?utm_content=link&utm_medium=content_shared

TONY EASTLEY: A leading professor and physician in infectious diseases says early clinical trials revealed there were potential problems with Australia's flu vaccine.

All seasonal flu vaccinations were recently suspended after almost 300 children who had flu shots suffered side effects.

Professor of Infectious Diseases at the Australian National University Peter Collignon, says clinical trials uncovered issues with the flu vaccine.

But Australia's chief medical officer Professor Jim Bishop disagrees. He says the clinical trials Peter Collignon refers to are unrelated.

Liv Casben reports:

LIV CASBEN: Last week the seasonal flu vaccination programme was suspended for children under five, because of health concerns. But Professor Peter Collignon from the Australian National University says - well before that - there were signs something was wrong.

PETER COLLIGNON: The early warning signs were in the original studies by the vaccine manufacturer, CSL, in children, that was published in January in a journal called JAMA and this looked at about 370 children who were vaccinated last October with the swine flu vaccine.

And what was surprising is particularly young children under the age of three. About 35 per cent of those developed a fever when they were given the lower dose of the vaccine.

LIV CASBEN: Why did the Government insist on rolling out the vaccination programme then if clinical trials showed there were problems?

PETER COLLIGNON: Well I'm not sure how this, you know, whether this was all appreciated, I guess our regulator would know that - the TGA (Therapeutic Goods Administration).

LIV CASBEN: Around 50 children in Western Australia have suffered side effects after being vaccinated against the seasonal flu. With almost 300 suspected cases across Australia. Professor Collignon says part of the problem lies with an inadequate monitoring system.

PETER COLLIGNON: The trouble is we go from having fairly intensive clinical studies by companies such as CSL and then there's no further evaluation other than a voluntary reporting of the most severe affects.

LIV CASBEN: He says there needs to be much better surveillance.

PETER COLLIGNON: Well, I think the surveillance system for this particular thing was less than adequate. I mean, at least we do know that we've had a lot of adverse reactions around Australia and particularly the information that has come from Western Australia.

But, one of the real problems is we've rolled out this vaccine without even really knowing how many doses of the vaccine have been given let alone how many side affects people have had; and I do think that we needed to do a better job than what is being done with this vaccine so that we make sure we keep the confidence in the general public.

LIV CASBEN: Australia's chief medical officer Professor Jim Bishop says the investigation into the vaccine in question - is still underway.

JIM BISHOP: We're not convinced that the seasonal flu vaccine is responsible for the cases that have been quoted yet.

LIV CASBEN: He says the clinical trials Professor Collignon is referring to are completely unrelated.

JIM BISHOP: That was a trial of the swine flu vaccine. The swine flu vaccine has now been used in millions of children. We haven't seen high fever rates.

LIV CASBEN: Professor Bishop says Australia's surveillance system is highly effective and that the cases in Western Australia prove that.

TONY EASTLEY: Liv Casben reporting.

NATURAL NEWS
Defending Health, Life and Liberty

Mike Adams

Influenza vaccine sends children into convulsions

Natural News, 12 May 2010
http://www.naturalnews.com/028773_vaccines_convulsions.html

Influenza vaccines have sent 57 children into life-threatening convulsions, reports The Age out of Australia. These influenza vaccines were being give to children under five to "protect" them from seasonal flu, but after receiving the shots, these children started going into convulsions.

An investigation has revealed that there is no quality control problem with any particular batch of influenza vaccines. They all pass quality control, in other words, so the convulsions are being caused by what is intentionally put into the vaccines, not by some mistaken chemical contaminant.

This, of course, baffles conventional doctors who have all been told that vaccines are perfectly safe and could never harm anyone. So rather than pausing to consider what might be contained in the vaccines that's causing children to go into convulsions, they charge ahead with the recommendation that even more people should get vaccines.

Alan Hampson, chairman of Australia's Influenza Specialist Group, "...advised young, healthy people anxious to get the flu vaccine to consider having the swine flu vaccine" reports The Age. There is no amount of real-world evidence, you see, that can break the mythological stranglehold that vaccines have over the minds of mainstream physicians. Even if children start dropping to the floor and convulsing right in front of them, they will continue to push vaccines on even more children.

The illusion of vaccine efficacy

Vaccines are based on a scientific-sounding mythology that is widely believed by gullible physicians and scientists who simply believe what they are told rather than what's real.

This mythology is based on the belief that injecting foreign matter into the human body will cause the immune system to adapt to the weakened foreign matter by creating antibodies that fight off future infections. This explanation, however, is pure mythology. In reality, an immune system can only invoke an adaptive response when it is properly nourished with vitamin D. And if the patient has enough vitamin D, they need no vaccine because vitamin D protects them from seasonal influenza in the first place.

Thus, vaccines only "work" in those people who don't need them. People who have the least protection against influenza due to their vitamin D deficiency also have the weakest immune response to vaccines. The vaccines, in other words, just don't work on them.

Children with particularly weak neurology are highly susceptible to neurological damage from vaccines. This damage may take the form of a coma, convulsions, autism or being partially paralyzed. Some children given vaccines soon find themselves in wheelchairs, unable to walk even though previous to the vaccine they were star athletes.

AS03 adjuvanted AH1N1 vaccine associated with an abrupt increase in the incidence of childhood narcolepsy in Finland

PLoS One, 28 March 2012; 7:e33536
https://journals.plos.org/plosone/article?id=10.1371/journal.pone.0033536

Abstract

Background
Narcolepsy is a chronic sleep disorder with strong genetic predisposition causing excessive daytime sleepiness and cataplexy. A sudden increase in childhood narcolepsy was observed in Finland soon after pandemic influenza epidemic and vaccination with ASO3-adjuvanted Pandemrix. No increase was observed in other age groups.

Methods
Retrospective cohort study. From January 1, 2009 to December 31, 2010 we retrospectively followed the cohort of all children living in Finland and born from January 1991 through December 2005. Vaccination data of the whole population was obtained from primary health care databases. All new cases with assigned ICD-10 code of narcolepsy were identified and the medical records reviewed by two experts to classify the diagnosis of narcolepsy according to the Brighton collaboration criteria. Onset of narcolepsy was defined as the first documented contact to health care because of excessive daytime sleepiness. The primary follow-up period was restricted to August 15, 2010, the day before media attention on post-vaccination narcolepsy started.

Findings
Vaccination coverage in the cohort was 75%. Of the 67 confirmed cases of narcolepsy, 46 vaccinated and 7 unvaccinated were included in the primary analysis. The incidence of narcolepsy was 9.0 in the vaccinated as compared to 0.7/100,000 person years in the unvaccinated individuals, the rate ratio being 12.7 (95% confidence interval 6.1–30.8). The vaccine-attributable risk of developing narcolepsy was 1∶16,000 vaccinated 4 to 19-year-olds (95% confidence interval 1∶13,000–1∶21,000).

Conclusions
Pandemrix vaccine contributed to the onset of narcolepsy among those 4 to 19 years old during the pandemic influenza in 2009–2010 in Finland. Further studies are needed to determine whether this observation exists in other populations and to elucidate potential underlying immunological mechanism. The role of the adjuvant in particular warrants further research before drawing conclusions about the use of adjuvanted pandemic vaccines in the future.

European Centre for Disease Prevention and Control
Narcolepsy in association with pandemic influenza vaccination
A multi-country European epidemiological investigation.

Stockholm: ECDC; 20 September 2012.
https://www.ecdc.europa.eu/en/publications-data/narcolepsy-association-pandemic-influenza-vaccination-multi-country-european

This report summarises the results from two epidemiological studies conducted by the Vaccine Adverse Event Surveillance and Communication (VAESCO) Consortium undertaken in eight European Union (EU)/European Economic Area (EEA) countries in order to investigate a possible association between an unexpected increase in narcolepsy cases following the use of influenza A(H1N1)pdm09 vaccines.

Narcolepsy is an underdiagnosed disease of widely unknown etiology. The VAESCO studies on narcolepsy include Sweden and Finland, which originally reported the safety signal (the signalling countries).

Apart from Sweden and Finland, the studies include the following six EU/EEA Member States: Denmark, Italy, France, the Netherlands, Norway and the United Kingdom (UK). These six countries are hereafter referred to as non-signalling countries when they are being referred to collectively.

Executive summary

ECDC technical report "Narcolepsy in association with pandemic influenza vaccination – a multi-country European epidemiological investigation" summarises results from two studies undertaken by ECDC and the Vaccine Adverse Event Surveillance and Communication (VAESCO) Consortium. It covers a study on narcolepsy background incidence rates and a case–control study to determine risk factors. Both studies concern the association between narcolepsy and specific influenza A(H1N1)pdm09 vaccines while at the same time considering other likely causes. These studies include Denmark, Finland, France, Italy, the Netherlands, Norway, Sweden and the United Kingdom.

A summary of the report is available as a separate document.

The case–control study confirms an association between vaccination with Pandemrix® and an increased risk of narcolepsy in children and adolescents (5 to 19 years of age) in Sweden and Finland that originally reported on this issue (signalling countries). No such association was found in adults in these two countries.

According to the strictest primary analysis, the kind of assessment designed to avoid most biases like media and diagnostic awareness biases, no significant risk was found in children and adolescents in other countries included in the study – Denmark, Italy, France, the Netherlands, Norway and the United Kingdom (non-signalling countries).

However, sensitivity analyses that assess the robustness of the results from the primary analysis, have highlighted the importance of several time-related factors that affect the strength of association between influenza pandemic vaccines and narcolepsy. An example of a time-related factor shown to influence results is the length of the chosen study period, that is, the inclusion of cases occurring before and after the period of media attention would give a different outcome.

One such sensitivity analysis was based on the date of onset of excessive day-time sleepiness before media attention. This identified an increased risk for narcolepsy for children and adolescents following influenza A(H1N1)pdm 09 vaccination in both signalling and non-signalling countries.

A similar sensitivity analysis also addressed date of onset of excessive daytime sleepiness and showed an association in adults in non-signalling countries before awareness increased.

To further inform the regulatory actions and the public, the report recommends increasing the statistical power by ensuring completeness of the case–control study through an exhaustive case inclusion in all age groups in the primary study period before increased awareness.

VAESCO is a European research network funded by ECDC and coordinated for ECDC by the Brighton Collaboration. It includes researchers from public health institutes, regulatory agencies and universities. The long term aim of the work is to create an independent infrastructure and epidemiological resource in support of vaccine safety monitoring and investigation in Europe.

Insight: Evidence grows for narcolepsy link to GSK swine flu shot

Reuters, 22 January 2013, 3:05 PM
https://www.reuters.com/article/us-narcolepsy-vaccine-pandemrix-idUSBRE90L07H20130122

Stockholm (Reuters) - Emelie Olsson is plagued by hallucinations and nightmares. When she wakes up, she's often paralyzed, unable to breathe properly or call for help. During the day she can barely stay awake, and often misses school or having fun with friends. She is only 14, but at times she has wondered if her life is worth living.

Emelie is one of around 800 children in Sweden and elsewhere in Europe who developed narcolepsy, an incurable sleep disorder, after being immunized with the Pandemrix H1N1 swine flu vaccine made by British drugmaker GlaxoSmithKline in 2009.

Finland, Norway, Ireland and France have seen spikes in narcolepsy cases, too, and people familiar with the results of a soon-to-be-published study in Britain have told Reuters it will show a similar pattern in children there.

Their fate, coping with an illness that all but destroys normal life, is developing into what the health official who coordinated Sweden's vaccination campaign calls a "medical tragedy" that will demand rising scientific and medical attention.

Europe's drugs regulator has ruled Pandemrix should no longer be used in people aged under 20. The chief medical officer at GSK's vaccines division, Norman Begg, says his firm views the issue extremely seriously and is "absolutely committed to getting to the bottom of this", but adds there is not yet enough data or evidence to suggest a causal link.

Others - including Emmanuel Mignot, one of the world's leading experts on narcolepsy, who is being funded by GSK to investigate further – agree more research is needed but say the evidence is already clearly pointing in one direction.

"There's no doubt in my mind whatsoever that Pandemrix increased the occurrence of narcolepsy onset in children in some countries – and probably in most countries," says Mignot, a specialist in the sleep disorder at Stanford University in the United States.

30 Million Received Pandemrix

In total, the GSK shot was given to more than 30 million people in 47 countries during the 2009-2010 H1N1 swine flu pandemic. Because it contains an adjuvant, or booster, it was not used in the United States because drug regulators there are wary of adjuvanted vaccines.

GSK says 795 people across Europe have reported developing narcolepsy since the vaccine's use began in 2009.

Questions about how the narcolepsy cases are linked to Pandemrix, what the triggers and biological mechanisms might have been, and whether there might be a genetic susceptibility are currently the subject of deep scientific investigation.

But experts on all sides are wary. Rare adverse reactions can swiftly develop into "vaccine scares" that spiral out of proportion and cast what one of Europe's top flu experts calls a "long shadow" over public confidence in vaccines that control potential killers like measles and polio.

"No-one wants to be the next Wakefield," said Mignot, referring to the now discredited British doctor Andrew Wakefield who sparked a decades-long backlash against the measles, mumps and rubella (MMR) shot with false claims of links to autism.

With the narcolepsy studies, there is no suggestion that the findings are the work of one rogue doctor.

Independent teams of scientists have published peer-reviewed studies from Sweden, Finland and Ireland showing the risk of developing narcolepsy after the 2009-2010 immunization campaign was between seven and 13 times higher for children who had Pandemrix than for their unvaccinated peers.

"We really do want to get to the bottom of this. It's not in anyone's interests if there is a safety issue that needs to be addressed," said GSK's Begg.

Life Changed

Emelie's parents, Charles and Marie Olsson, say she was a top student who loved playing the piano, taking tennis lessons, creating art and having fun with friends. But her life started to change in early 2010, a few months after she had Pandemrix. In the spring of 2010, they noticed she was often tired, needing to sleep when she came home from school.

But it wasn't until May, when she began collapsing at school, that it became clear something serious was happening.

As well as the life-limiting bouts of daytime sleepiness, narcolepsy brings nightmares, hallucinations, sleep paralysis and episodes of cataplexy - when strong emotions trigger a sudden and dramatic loss of muscle strength.

In Emelie's case, having fun is the emotional trigger. "I can't laugh or joke about with my friends any more, because when I do I get cataplexies and collapse," she said in an interview at her home in the Swedish capital.

Narcolepsy is estimated to affect between 200 and 500 people per million and is a lifelong condition. It has no known cure and scientists don't really know what causes it. But they do know patients have a deficit of a brain neurotransmitter called orexin, also known as hypocretin, which regulates wakefulness.

Research has found that some people are born with a variant in a gene known as HLA that means they have low hypocretin, making them more susceptible to narcolepsy. Around 25 percent of Europeans are thought to have this genetic vulnerability.

When results of Emelie's hypocretin test came back in November last year, it showed she had 15 percent of the normal amount, typical of heavy narcolepsy with cataplexy.

The seriousness of her strange new illness has forced her to contemplate life far more than many other young teens: "In the beginning I didn't really want to live any more, but now I have learned to handle things better," she said.

Triggers?

Scientists investigating these cases are looking in detail at Pandemrix's adjuvant, called AS03, for clues.

Some suggest AS03, or maybe its boosting effect, or even the H1N1 flu itself, may have triggered the onset of narcolepsy in those who have the susceptible HLA gene variant.

Angus Nicoll, a flu expert at the European Centre for Disease Prevention and Control (ECDC), says genes may well play a part, but don't tell the whole story.

"Yes, there's a genetic predisposition to this condition, but that alone cannot explain these cases," he said. "There was also something to do with receiving this specific vaccination. Whether it was the vaccine plus the genetic disposition alone or a third factor as well - like another infection - we simply do not know yet."

GSK is funding a study in Canada, where its adjuvanted vaccine Arepanrix, similar to Pandemrix, was used during the 2009-2010 pandemic. The study won't be completed until 2014, and some experts fear it may not shed much light since the vaccines were similar but not precisely the same.

It all leaves this investigation with far more questions than answers, and a lot more research ahead.

Was It Worth It?

In his glass-topped office building overlooking the Maria Magdalena church in Stockholm, Goran Stiernstedt, a doctor turned public health official, has spent many difficult hours going over what happened in his country during the swine flu pandemic, wondering if things should have been different.

"The big question is was it worth it? And retrospectively I have to say it was not," he told Reuters in an interview.

Being a wealthy country, Sweden was at the front of the queue for pandemic vaccines. It got Pandemrix from GSK almost as soon as it was available, and a nationwide campaign got uptake of the vaccine to 59 percent, meaning around 5 million people got the shot.

Stiernstedt, director for health and social care at the Swedish Association of Local Authorities and Regions, helped coordinate the vaccination campaign across Sweden's 21 regions.

The World Health Organisation (WHO) says the 2009-2010 pandemic killed 18,500 people, although a study last year said that total might be up to 15 times higher.

While estimates vary, Stiernstedt says Sweden's mass vaccination saved between 30 and 60 people from swine flu death. Yet since the pandemic ended, more than 200 cases of narcolepsy have been reported in Sweden.

With hindsight, this risk-benefit balance is unacceptable. "This is a medical tragedy," he said. "Hundreds of young people have had their lives almost destroyed."

Pandemics Are Emergencies

Yet the problem with risk-benefit analyses is that they often look radically different when the world is facing a pandemic with the potential to wipe out millions than they do when it has emerged relatively unscathed from one, like H1N1, which turned out to be much milder than first feared.

David Salisbury, the British government's director of immunization, says "therein lies the risk, and the difficulty, of working in public health" when a viral emergency hits.

"In the event of a severe pandemic, the risk of death is far higher than the risk of narcolepsy," he told Reuters. "If we spent longer developing and testing the vaccine on very large numbers of people and waited to see whether any of them developed narcolepsy, much of the population might be dead."

Pandemrix was authorized by European drug regulators using a so-called "mock-up procedure" that allows a vaccine to be authorized ahead of a possible pandemic using another flu strain. In Pandemrix's case, the substitute was H5N1 bird flu.

When the WHO declared a pandemic, GSK replaced the mock-up's strain with the pandemic-causing H1N1 strain to form Pandemrix.

GSK says the final H1N1 version was tested in trials involving around 3,600 patients, including children, adolescents, adults and the elderly, before it was rolled out.

The ECDC's Nicoll says early warning systems that give a more accurate analysis of a flu strain's threat are the best way to minimize risks of this kind of tragedy happening in future.

Salisbury agrees, and says progress towards a universal flu vaccine - one that wouldn't need last-minute changes made when a new strain emerged - would cuts risks further.

"Ideally, we would have a better vaccine that would work against all strains of influenza and we wouldn't need to worry about this ever again," he said. "But that's a long way off."

With scientists facing years of investigation and research, Emelie just wants to make the best of her life.

She reluctantly accepts that to do so, she needs a cocktail of drugs to try to control the narcolepsy symptoms. The stimulant Ritalin and the sleeping pill Sobril are prescribed for Emelie's daytime sleepiness and night terrors. Then there's Prozac to try to stabilize her and limit her cataplexies.

"That's one of the things that makes me feel most uncomfortable," she explains. "Before I got this condition I didn't take any pills, and now I have to take lots - maybe for the rest of my life. It's not good to take so many medicines, especially when you know they have side effects."

Risk of narcolepsy in children and young people receiving AS03 adjuvanted pandemic A/H1N1 2009 influenza vaccine: retrospective analysis

BMJ, 26 February 2013; 346:f794. doi: 10.1136/bmj.f794
https://pubmed.ncbi.nlm.nih.gov/23444425/

Abstract

Objective To evaluate the risk of narcolepsy in children and adolescents in England targeted for vaccination with ASO3 adjuvanted pandemic A/H1N1 2009 vaccine (Pandemrix) from October 2009.

Design Retrospective analysis. Clinical information and results of sleep tests were extracted from hospital notes between August 2011 and February 2012 and reviewed by an expert panel to confirm the diagnosis. Vaccination and clinical histories were obtained from general practitioners.

Setting Sleep centres and paediatric neurology centres in England.

Participants Children and young people aged 4-18 with onset of narcolepsy from January 2008.

Main outcome measures The odds of vaccination in those with narcolepsy compared with the age matched English population after adjustment for clinical conditions that were indications for vaccination. The incidence of narcolepsy within six months of vaccination compared with the incidence outside this period measured with the self controlled cases series method.

Results Case notes for 245 children and young people were reviewed; 75 had narcolepsy (56 with cataplexy) and onset after 1 January 2008. Eleven had been vaccinated before onset; seven within six months. In those with a diagnosis by July 2011 the odds ratio was 14.4 (95% confidence interval 4.3 to 48.5) for vaccination at any time before onset and 16.2 (3.1 to 84.5) for vaccination within six months before onset. The relative incidence from the self controlled cases series analysis in those with a diagnosis by July 2011 with onset from October 2008 to December 2010 was 9.9 (2.1 to 47.9). The attributable risk was estimated as between 1 in 57 500 and 1 in 52 000 doses.

Conclusion The increased risk of narcolepsy after vaccination with ASO3 adjuvanted pandemic A/H1N1 2009 vaccine indicates a causal association, consistent with findings from Finland. Because of variable delay in diagnosis, however, the risk might be overestimated by more rapid referral of vaccinated children.

Swine flu vaccine can trigger narcolepsy, UK government concedes

The Guardian, 19 September 2013, 19.32 BST
http://www.theguardian.com/society/2013/sep/19/swine-flu-vaccine-narcolepsy-uk

Review of fresh evidence finds jab given to 6 million people in Britain can occasionally cause sleep disorder.

The government is to reverse its stance on the safety of a swine flu vaccine given to 6 million people in Britain and accept that on rare occasions the jab can trigger the devastating sleep disorder narcolepsy.

The Department for Work and Pensions (DWP) has contacted people turned down for compensation last year to explain that, after a review of fresh evidence, it now accepts the vaccine can cause the condition. The move leaves the government open to compensation claims from around 100 people in Britain, and substantial legal fees if a group action drawn up by solicitors is successful.

Peter Todd, who is preparing the case at the London firm Hodge, Jones and Allen, said that damages could reach £1m for each person.

The Pandemrix vaccine, made by GlaxoSmithKline, was given to high-risk groups, including children and those with asthma, diabetes and heart disease at the height of the 2009-10 swine flu pandemic. Across Europe, around 31 million people received the jab. The vaccine was made specifically to tackle pandemics and is very different to the normal seasonal flu vaccine which has not been linked to narcolepsy.

The condition is a rare but serious neurological disorder that affects about 31,000 people in Britain. The condition can cause massive sleep disruption. The worst hit are often young people who face enormous learning difficulties at school and university. The disorder can destroy self-esteem, and bullying is common. Adults can lose their jobs, their driving licences, and can have difficulties with relationships. Some narcoleptics have another condition called cataplexy, a total loss of muscle control.

The government U-turn follows a major study of four- to 18-year-olds by the Health Protection Agency which found that around one in every 55,000 jabs was associated with narcolepsy. A spokesman for GSK said it had details of around 900 people from 14 countries who had narcolepsy and were vaccinated.

The welfare minister, Iain Duncan Smith, will announce the reversal in October, according to a letter seen by the Guardian. "It has been accepted that, on the balance of probability, vaccination has contributed to … disablement," the letter says.

The DWP denies that any disability caused by Pandemrix is severe enough to qualify for statutory compensation, a £120,000 tax-free lump sum, but invites people to respond within three weeks.

Todd argues that "in nearly all cases" people who developed narcolepsy from the jab would qualify for compensation. The group action will be brought against GSK, but Todd said the drug company had an indemnity clause in its contract to provide the vaccine which means government will ultimately foot the bill. "Some of these multiparty actions cost endless millions. You can imagine the number of experts involved. We fill up the court when we turn up with these cases," he said.

The decision was welcomed by Matt O'Neill of Narcolepsy UK. "There are a lot of parents who have been waiting for the right decision on this," he said. "The problem is that compensation is based on proving that you're eligible, and that could be very hard for children to articulate."

In a statement, GSK said: "Patient safety is our number one priority and we are actively researching how narcolepsy is triggered and how this vaccine might have interacted with other risk factors in affected individuals. We hope these ongoing research efforts will enable us to provide more answers.

"Narcolepsy is a complex disease and its causes are not yet fully understood but it is generally considered to be associated with genetic and environmental factors, including infections. We remain committed to pursuing additional research to understand the association between Pandemrix and narcolepsy and continue to support the research of others who are investigating reported cases."

A Department of Health spokesperson said: "Pandemrix was developed specifically for use in a flu pandemic when the number of lives lost and serious cases could have been enormous.

"The decision to recommend that children got this vaccine during the flu pandemic was based on evidence available at the time, along with the advice from the European Medicines Agency which approved its use.

"We keep all emerging evidence under review and that's why use of Pandemrix in those less than 20 years old was stopped in the UK in 2011."

Narcolepsy cases linked to flu vaccine subject to new compensation dispute

The uardian, 25 September 2015, 07.00
https://www.theguardian.com/society/2015/sep/25/narcolepsy-cases-linked-to-flu-vaccine-subject-to-new-compensation-dispute

Lawyers dispute claims over Pandemrix swine flu vaccine which was withdrawn after doctors noticed rise in narcolepsy cases

Government lawyers are seeking to block compensation payments to people who developed the devastating sleep disorder, narcolepsy, as a result of a faulty swine flu vaccine.

The Pandemrix vaccine made by GlaxoSmithKline (GSK) was given to 6 million people in Britain and millions more across Europe during the 2009-10 swine flu pandemic, but was withdrawn when doctors noticed a rise in narcolepsy cases among those who received the jab.

In June, a 12-year-old boy was awarded £120,000 by a court that ruled he had been left severely disabled by narcolepsy caused by Pandemrix. The win ended a three-year battle with the government that argued his illness was not serious enough to warrant compensation.

Narcolepsy is a permanent condition that can cause people to fall asleep dozens of times a day, even when they are in mid-conversation. Some suffer from night terrors and a problem with muscular control called cataplexy that can lead them to collapse on the spot.

The boy, who remains anonymous, has become disruptive at school because he is so tired and finds it almost impossible to socialise. He needs to take several naps in the school day and cannot shower unattended or take a bus alone. He may never be able to drive as an adult.

The government has paid out to the boy's family, but has nonetheless asked the court of appeal for permission to challenge the decision. A successful appeal would effectively deny compensation to 100 more families awaiting damages and could rule out any prospect of damages for other children who are injured by different vaccines in the future.

"It is causing tremendous delay in getting compensation to those in dire need of help and who are entirely innocent and blameless people," said Peter Todd, the solicitor for the family of the 12-year-old boy and a partner with the London firm Hodge Jones and Allen. "They were responsible enough to get vaccinated and unfortunately have suffered a severe brain injury due to a defect with the vaccine, which was not detected as it was not tested at all on children before it was given out."

The government argues that vaccine damages should be decided on the immediate, rather than the future, impact of the vaccine-related injury. In this case, that would mean comparing the life of a 12-year-old boy with narcolepsy with a healthy boy the same age. Any effect on his future sex life, his ability to drive, his ability to work or go to university would be completely disregarded.

"That is a radical interpretation of the law. It is very hard to show that you are disabled enough [to qualify for compensation] if the vast majority of your disability had to be ignored," said Todd. "If their interpretation was accepted by the court of appeal, it would virtually abolish the prospects of anybody ever getting any vaccine injury compensation in the UK, because vaccines are mainly given to children and usually very young children."

Injuries caused by vaccines are very rare. In Britain, only about 1000 awards for vaccine-related injuries have been handed out since 1979. Only in very rare cases did children develop narcolepsy from Pandemrix, which is a very different formulation to the seasonal flu vaccine. A major study by the Health Protection Agency in 2013 found that one in every 55,000 swine flu jabs triggered the sleep disorder. To qualify for the Department of Work and Pension's vaccine damage payment scheme, a person has to be at least 60% disabled, the equivalent to the loss of one hand.

The government has long argued that those who developed narcolepsy from Pandemrix vaccination are not seriously enough disabled to qualify for damages. Last year, a 23-year-old nursery assistant who became narcoleptic after the jab took her own life. She left a note telling her family that living with the sleep disorder made her life unbearable.

In July, scientists at Novartis Vaccines reported progress in understanding how Pandemrix causes narcolepsy in a small percentage of people. Writing in the journal Science Translational Medicine, they described how in affected people, the jab destroyed the bulk of 70,000 neurons in the brain that produce a "wakefulness" hormone, hypocretin.

A government spokesperson said: "We are asking the court of appeal for permission to appeal against a decision made by the upper tribunal on the vaccine damage payments scheme. It would not be appropriate to comment further until the conclusion of this process."

A separate claim against GSK for full compensatory damages is being discussed with the Department of Health, as the pharmaceutical company had an indemnity in their contract to provide Pandemrix to the government.

Ministers lose fight to stop payouts over swine flu jab narcolepsy cases

The Guardian, 9 February 2017, 10.56 GMT
https://www.theguardian.com/science/2017/feb/09/ministers-lose-fight-to-stop-payouts-in-swine-flu-jab-narcolepsy-cases

Dozens of children who developed sleep disorder after getting vaccine could get compensation after high court ruling.

Dozens of British children who developed narcolepsy as a result of a swine flu vaccine could be compensated after the high court rejected a government appeal to withhold payments.

Six million people in Britain, and more across Europe, were given the Pandemrix vaccine made by GlaxoSmithKline during the 2009-10 swine flu pandemic, but the jab was withdrawn after doctors noticed a sharp rise in narcolepsy among those who received it.

The sleep disorder is permanent and can cause people to fall asleep dozens of times a day. Some narcoleptics have night terrors and a muscular condition called cataplexy that can lead them to collapse on the spot.

In 2015, a 12-year-old boy, known as John for the proceedings, was awarded £120,000 by a court that ruled he had been left severely disabled by narcolepsy caused by the vaccine. He was seven when he had the jab and developed symptoms within months.

Because of his tiredness, John became disruptive at school and found it almost impossible to make friends. He takes several naps a day, cannot shower or take a bus on his own, and may never be allowed to drive a car.

Despite paying out, the Department for Work and Pensions argued John's disability was not serious enough to warrant compensation and said the court was wrong to take into account how the illness would affect him in the future. But the high court on Thursday rejected the government's appeal that only the boy's disability at the time should have been considered.

The ruling paves the way for more than 60 other people to claim compensation.

"This important decision brings clarity to anyone who brings claims under the Vaccine Damage Payment Act in future," said Peter Todd, the family's solicitor at Hodge Jones & Allen. "It will in particular bring welcome relief to those who developed narcolepsy as a result of taking the swine flu vaccination and who have been awaiting payment from the DWP scheme but also has implications for anyone affected by other vaccines covered by the scheme."

The judgment means the DWP has to take into account the impact disability has on a person's entire life, and not just the impact it has on the individual at the time their claim is made.

"Sadly, those who developed narcolepsy as a result of the swine flu vaccination have had their lives changed forever. The condition will affect many aspects of their lives including working, driving, personal and family relationships – the very things most of us take for granted," Todd said.

In 2014, a 23-year-old nursery assistant who developed narcolepsy after receiving the swine flu vaccine took her own life, telling her family that living with the sleep disorder had become unbearable. In a note written on the day she died, Katie Clack, urged her family to pursue her legal case, saying she had been left with "no quality of life". Her sister, Emma Sutton, told the Guardian at the time: "We feel she was let down by the defective vaccine, which caused her narcolepsy, and by the insufficient intervention and support, which ultimately led to this tragedy."

The Pandemrix compensation case was the first that the court of appeal considered under the UK statutory compensation scheme, which was set up in 1979 for rare occasions when vaccines cause severe damage. The decision to consider the impact of the disability over the person's entire life is now binding on all future cases brought under the act.

Todd said there are about 100 people in the UK with narcolepsy caused by Pandemrix. A further 100 applications a year are made for compensation under the scheme due to harm caused by other vaccines. "Today's judgment brings a welcome relief to the many people affected by the DWP's continued refusal of applications for compensation," Todd said. He is acting for 88 claimants, mostly children, who developed narcolepsy as a result of the swine flu vaccine, and in a civil case against GSK, which manufactured the vaccine.

A DWP spokesperson said: "We are aware of the judgment of the court and are carefully studying the court's reasons."

Settlement reached in swine flu vaccine case

RTE, 19 November 2019, 21:14
https://www.rte.ie/news/courts/2019/1119/1092827-aoife-bennett/

A High Court action for damages by a student who claimed she developed the sleep disorder narcolepsy after receiving the swine flu vaccine has been settled.

Details of the settlement in the case of Aoife Bennett from Naas, Co Kildare, have not been made public.

However, she is to receive compensation and the High Court was told all her costs are to be paid by the Minister for Health and the Health Service Executive.

Mr Justice Michael McGrath said he was delighted the case had gone to mediation and praised all sides for their handling of the case.

The case began on 8 October and was expected to last ten weeks and cost millions of euro.

It was seen as a test case for up to 100 more and the court had been asked to determine if any or all of the defendants, including the vaccine maker and the State, were liable for damages.

The defendants in the case were GlaxoSmithKline Biologicals, the Health Service Executive, the Minister for Health and the Health Products Regulatory Authority, formerly the Irish Medicines Board.

All claims made in the case were denied and the settlement was made without admission of liability.

No orders were made against the HPRA or GSK.

Ms Bennett was 16 when she was given the Pandemrix vaccine at school as part of a vaccination programme administered by the HSE.

The court heard she was later diagnosed with an incurable, life-changing sleep disorder narcolepsy, excessive daytime sleepiness and episodes of sudden weakness known as cataplexy.

At the opening of the case, lawyers for Ms Bennett said it was not an anti-vaccine case, but was about a once off badly managed vaccine, which had not been properly tested on teenagers.

Senior Counsel Dermot Gleeson said the rare autoimmune disease can be caused when those with a certain genetic variant receive a new adjuvant or booster contained in a vaccine.

Because narcolepsy was an auto immune disease, the vaccine affected children and teenagers in a different way because their immune systems were not fully developed, he said.

Mr Gleeson said the narcoleptic effect of the vaccine was located in about 1,000 children across Europe and a public inquiry set up in Ireland concluded that there was a 12 to 14 fold increase in the chance of becoming narcoleptic in those with a certain gene variant who were given the vaccine.

He said there were 75 to 100 children identified with the condition in Ireland, 350 in Sweden, up to 200 in Finland, 100 in France and in the UK and a handful in Denmark and the Netherlands.

It was claimed during the case adverse reactions from Pandemrix were ten times greater than seen with another swine flu vaccine administered in Canada.

All claims were denied and the defendants argued the Pandemrix vaccine was properly authorised by the European Commission for use in all EU member states and was required to address the swine flu pandemic.

Lawyers for the vaccine maker GSK said no causal link had been established between the Pandemrix swine flu vaccine and the sleep disorder narcolepsy despite ten years of research.

Afterwards, Ms Bennett's mother Mary thanked her daughter for having the courage to take the case.

She described it as a "landmark" case and said it was extremely difficult for a 26-year-old "to take on the might of the State and a large multinational company GSK" while also coping with her illness.

She added: "Today, Aoife has succeeded in recovering compensation and her case has been vindicated.

"However, no money will ever compensate Aoife for a lifetime of living with the incurable disability of narcolepsy and cataplexy."

She said she hoped the settlement would pave the way for the 100 other people to receive proper compensation.

"Hopefully, this can be achieved without the need to go through a protracted trial like Aoife has," she said.

She also criticised what she described as "the adversarial approach" taken by the defendants in the case, adding: "I hope will not be replicated for other families. Aoife had no State legal aid, whilst the defendants had access to unlimited taxpayers' monies."

During the case, the Bennetts had claimed the State was aware of the safety concerns and the lack of proper testing of this particular vaccine and that a new adjuvant (booster) had been used in the vaccine and that they had failed to properly inform them and the public about these concerns.

These claims had been denied.

Ms Bennett also said the State authorities continue to deny that they owe her and the public any duty of care with regard to administering vaccines.

They continue to deny that the vaccine caused narcolepsy.

She said evidence during the case showed that GSK had been settling similar claims in the UK for the past three years, adding: "This begs the question why Ireland didn't follow a similar approach which would have been less onerous on the victims and the families."

She called for a review of HSE/Department of Health communication policies with the public to ensure all relevant information is given to the patient, so they can give proper "informed consent".

She said: "It is a national scandal that millions of taxpayers' money has been wasted in defending my case and other similar cases against children and young people who do not have any right to legal aid.

"In this regard I would to express my thanks to my legal team for their help and support throughout the years and all the experts who gave evidence to support my case."

Narcolepsy group expresses disappointment with State for fighting case

The narcolepsy group SOUND (Sufferers Of Unique Narcolepsy Disorder) has expressed disappointment with the State for 'fighting the case' with Ms Bennett.

In a statement released after today's settlement, Sound Secretary Tadgh Kennedy said: "We thank Aoife and the Bennett family for taking the first landmark case.

"However, we are disappointed that the State saw fit to fight the case in court.

"Approximately 100 other children and young adults must now await the outcome of their own legal cases, which the State insists must be taken on an individual basis.

"The State should ensure that this is not a long, drawn-out legal process, causing further hardship.

"From the start, the State's response to what transpired has been painfully slow, and this remains a difficult and protracted process for the families involved.

"Sound wants the State to fulfill the duty of care it is morally bound to provide to children and young adults who now have to move through life with narcolepsy.

"The cost to the State of this action alone can be measured in millions," said Mr Kennedy.

RTÉ

Swine flu vaccine induced narcolepsy made Bennett feel 'like a sloth'

RTE, 20 November 2019, 15:33
https://www.rte.ie/news/health/2019/1120/1094043-swine-flu-narcolepsy/

A student, who claimed she developed the sleep disorder narcolepsy after receiving the swine flu vaccine a decade ago, has described how she was "like a sloth" when the effects of the disease first hit.

Aoife Bennett from Naas, Co Kildare settled her action at the High Court yesterday.

Speaking on RTÉ's Today with Seán O'Rourke, Ms Bennett said she was satisfied with the outcome yesterday, but looking back she did not know how she and her family coped with the long drawn out days at the High Court. => https://www.rte.ie/news/courts/2019/1119/1092827-aoife-bennett/

She said was not expecting the adversarial nature of the cross-examination and said it was "very tough to watch" her parents when they were being cross-examined.

Ms Bennett said she hoped that other families who had cases pending would not have to go through the same thing.

The 26-year-old said her family was "seven years in legal proceedings and had never wanted to take that route".

She added that she was shocked that the Minister for Health and the Department of Health had allowed it to go on for so long.

Ms Bennett said she imagined that it was very disappointing for the other families that there was no admission of liability in her case and said that her family was disappointed with that too.

She said her family was not anti vaccine because, if they were, she would not have got the vaccine in the first place.

Ms Bennett said she was very active and athletic, and school was no bother until she got the vaccine, when "things changed very drastically".
Ms Bennett said it took about two weeks before the side-effects began after she received the vaccine on 10 December 2009.

She told the programme that the first day that she noticed a change was when she was shopping in Dublin with a friend on 23 December.

She said she could not get from Busarus to Abbey Street because she was completely disorientated and it took her an extra two to three hours to get home.

That Christmas, she said, she had to force herself to come downstairs for Christmas dinner and spent the rest of the day in bed.

She said her mum read an article in March 2011 about another girl who had suffered narcolepsy after receiving the swine flu vaccine. The symptoms fit, she said, so she went to get tests.

Ms Bennett also suffers from cataplexy, a medical condition in which strong emotion or laughter causes a person to suffer sudden physical collapse though remaining conscious.

Before she received medication for this, she said, she could literally collapse to the floor.

She said she used to run a lot and play volleyball and although she tried to continue, it was impossible before she was diagnosed.

Ms Bennett said when she was first prescribed medication to help keep her awake, it worked wonders but she later realised she did not have the alertness to sit in a classroom and take things in.

She added that it had been a bit of trial and error with medication and over time she has had to increase dosages.

Ms Bennett, who has a primary degree in English and Irish, and a Masters in primary school teaching, said it was unlikely that she would ever be able to work full time.

The busier she was, she said, the harder it was to cope.

She said that one of the nighttime medications she takes means she cannot take any alcohol, so she has to pick and choose three or four nights out a year that she can enjoy.

Ms Bennett said that she did not really socialise at night, adding two nights out in a row in the space of a month or less would have a huge impact on her.

As far as she knows, there is no cure for the diseases.

The Guardian

Swine flu vaccine case settled but hopes for legal precedent dashed

The Guardian, 20 November 2019, 13.35 GMT
https://www.theguardian.com/world/2019/nov/20/swine-flu-vaccine-case-settled-but-hopes-for-legal-precedent-dashed

Woman says she developed narcolepsy after receiving Pandemrix vaccine at school.

The Irish government has settled a legal case with a woman who said she developed narcolepsy because of a swine flu vaccine.

The health minister and the health service executive agreed to compensate and pay the full legal costs of Aoife Bennett, 27, who received the Pandemrix vaccine in school in 2009 as part of a state campaign against swine flu.

The settlement, reached via mediation on Tuesday, ended what promised to be a protracted case at the high court in Dublin.

Details of the compensation were not disclosed and the state admitted no liability, which will come as a blow to dozens of other people with narcolepsy considering similar cases and hoping for a legal precedent.

In 2017, the UK high court rejected a British government appeal to withhold payments to dozens of British children who developed the sleeping disorder after swine flu vaccines.
https://www.theguardian.com/science/2017/feb/09/ministers-lose-fight-to-stop-payouts-in-swine-flu-jab-narcolepsy-cases

Six million people in Britain, and more across Europe, were given the Pandemrix vaccine made by GlaxoSmithKline during the 2009-10 swine flu pandemic, but the jab was withdrawn after doctors noticed a sharp rise in narcolepsy among those receiving it.

Bennett told RTE on Wednesday that she was active and athletic until being vaccinated in December 2009. About two weeks later the side-effects began, she said.
=> https://www.rte.ie/news/health/2019/1120/1094043-swine-flu-narcolepsy/
“Things changed very drastically.” She felt “like a sloth” and became fatigued, disoriented and prone to collapse.

She expressed dismay that it took seven years of legal proceedings to obtain compensation.

The defendants in the case were GlaxoSmithKline Biologicals, the health service executive, the minister for health and the health products regulatory authority, formerly the Irish medicines board.

All claims made in the case were denied. No orders were made against the pharmaceutical giant nor the regulatory authority.

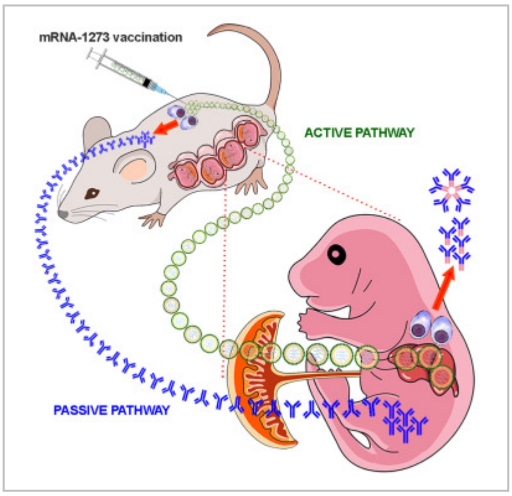
mRNA-1273 is Placenta-permeable and Immunogenic in the Fetus

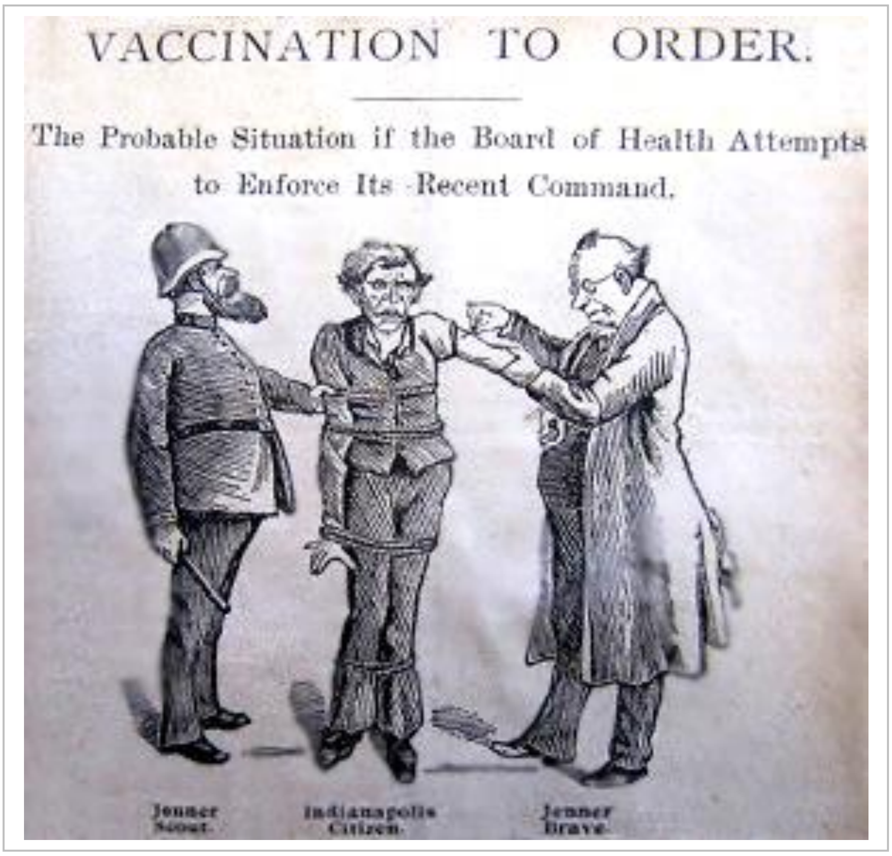
College of Medicine, Chang Gung University, Taoyuan 333, Taiwan
Molecular Therapy: Nucleic Acid, 2025; https://doi.org/10.1016/j.omtn.2025.102489
https://www.sciencedirect.com/science/article/pii/S2162253125000435?utm_source=substack&utm_medium=email



Abstract

COVID-19 mRNA vaccines are generally recognized as safe for gestational administration. However, their transplacental pharmacokinetics remains obscure.

In this study, mRNA-1273 intramuscularly given to pregnant mice rapidly circulated in maternal blood and crossed the placenta within one hour to spread in fetal circulation. Although spike mRNA in fetal circulation faded away within 4-6 hours, it could accumulate in fetal tissues, mainly the liver and get translated into spike protein.



Transplacental mRNA-1273 proved immunogenic in the fetuses, as postnatally equipped with anti-spike IgM, paternal allotypic anti-spike IgG2a and heightened anti-spike cellular immunity. Gestationally administered, mRNA-1273 had a dose-dependent effect on its transplacental transfer and immunogenicity in the fetuses, with higher mRNA-1273 doses leading to increased transplacental mRNA-1273 passage and greater serum titers of endogenous anti-spike IgM/IgG generated by the fetuses.

Thus, gestationally maternal mRNA-1273 vaccination might endow the newborns with not only passive but also active anti-spike immunity. Our results pose new insights into transplacental capacity of mRNA vaccines and their immunogenic potential in the fetuses, advancing our knowledge of mRNA medicine to protect the unborns against pathogens in perinatal life and broaden our horizons of prenatal mRNA molecular therapy.

Big Pharma: Baxter Files Swine Flu Vaccine Patent a Year Ahead of Outbreak

Global Research, July 18, 2009
https://www.globalresearch.ca/big-pharma-baxter-files-swine-flu-vaccine-patent-a-year-ahead-of-outbreak/14430

Barack Opharma issues the ultimate bad news during his weekly Friday night bad news dump: Legal immunity set for swine flu vaccine makers 17 Jul 2009 The last time the government embarked on a major vaccine campaign against a new swine flu, thousands filed claims contending they suffered side effects [paralysis, death] from the shots. This time, the government has already taken steps to head that off. Vaccine makers and federal officials will be immune from lawsuits that result from any new swine flu vaccine, under a document signed by Secretary of Health and Human Services Kathleen Sebelius, government health officials said Friday. The document signed by Sebelius last month grants immunity to those making a swine flu vaccine, under the provisions of a 2006 law for public health emergencies.

Baxter Files Swine Flu Vaccine Patent a Year Ahead of Outbreak –US20090060950A1 to Baxter International filed 28th August 2008 By Lara 10 Jul 2009 Baxter Vaccine Patent Application US 2009/0060950 A1 –'In particular preferred embodiments the composition or vaccine comprises more than one antigen…..such as influenza A and influenza B in particular selected from of one or more of the human H1N1, H2N2, H3N2, H5N1, H7N7, H1N2, H9N2, H7N2, H7N3, H10N7 subtypes, of the pig flu H1N1, H1N2, H3N1 and H3N2 subtypes, of the dog or horse flu H7N7, H3N8 subtypes or of the avian H5N1, H7N2, H1N7, H7N3, H13N6, H5N9, H11N6, H3N8, H9N2, H5N2, H4N8, H10N7, H2N2, H8N4, H14N5, H6N5, H12N5 subtypes.'

Baxter can take no more H1N1 flu vaccine orders 16 Jul 2009 While at least 50 governments have placed orders or are negotiating with drug companies for supplies of flu vaccine against the [their] fast spreading H1N1 strain, the lone U.S.-based maker has already taken on as much as it can handle. Baxter International Inc said on Thursday it has taken orders from five countries, including Britain, Ireland and New Zealand, for a total of 80 million doses of H1N1 vaccine and will not take any more.

'Clearly we believe this demand has the potential to translate into a significant opportunity.' Baxter 2Q Profit Up 7.9%; Full-Year Guidance Raised 16 Jul 2009 Baxter International Inc. posted a stronger-than-expected 7.9% rise in second-quarter profit with help from improved margins and product sales that continued to avoid any hits from the economic downturn. The medical-products maker boosted its 2009 earnings guidance while saying the increase doesn't reflect at this point any contribution from making a vaccine for the H1N1 flu strain. Baxter reported a second-quarter profit of $587 million, or 96 cents a share, up from $544 million, or 85 cents a share, a year earlier.

Baxter working on vaccine to stop swine flu, though admitted sending live pandemic flu viruses to subcontractor By Lori Price 26 Apr 2009 The OMFG moment of the century: Illinois-based Baxter working on vaccine to 'stop' swine flu outbreak in Mexico 25 Apr 2009 Specialty drug maker Baxter International Inc. will work with the World Health Organization to develop a vaccine

that could stem [foment] an outbreak of a deadly swine flu strain in Mexico. Baxter spokesman Christopher Bona said Saturday that the Deerfield, Ill.-based company has asked the WHO for a sample of the flu strain. He says Baxter has patented technology that allows the company to develop vaccines in half the time it usually takes — about 13 weeks instead of 26.

Baxter admits sending live avian flu viruses to subcontractor – Baxter admits contaminated seasonal flu product contained live bird flu virus 27 Feb 2009 The company that released contaminated flu virus material from a plant in Austria confirmed Friday that the experimental product contained live H5N1 avian flu viruses. And an official of the World Health Organization's European operation said the body is closely monitoring the investigation into the events that took place at Baxter International's research facility in Orth-Donau, Austria.

https://www.legitgov.org/baxter_sends_live_avian_flu_viruses_270209.html

Human trial of swine flu vaccine 'soon' 15 Jul 2009 The federal government has defended its policy of not following the United Kingdom's lead and rushing out a swine flu vaccine. Biopharmaceutical company CSL will start clinical vaccine trials on 240 healthy adults in Adelaide next week. The vaccine is due to be rolled out in October.

Part 1
The H1N1 swine flu experimental vaccination, martial law and eugenics story

Examiner, 2 August 2009, 09:06, PM
https://web.archive.org/web/20100418175845/http://www.examiner.com/x-10438-Peace-Studies-Examiner~y2009m8d2-Part-1--The-global-economic-crisis-H1N1-experimental-vaccination-martial-law-and-eugenics-story

Introduction

The World Health Organization (WHO) level 6 pandemic alert and the U.S. national emergency measures, supposedly to contain the H1N1 swine flu "pandemic," are raising a classic civil rights issue:

Now that the U.S. military is deployed in the U.S. and the Pentagon is planning to deploy more troops to assist with a national flu vaccination program, to what extent can an American's liberty be curtailed to advance the common good?

Many other questions are being asked about these issues, perhaps not enough considering the conflicting reports from officials.

On April 26 2009, NY TImes reported that American federal health officials declared a public health emergency. Among other activities, a U.S. emergency declaration "lets the government… give some previously unapproved tests and drugs to children" according to the April 27, 2009 NY Times article. John Brennan, Assistant to the President for Homeland Security and Counterterrorism stated in a press briefing on April 26:

"Secretary Napolitano and the Department of Homeland Security have the overall lead for coordinating the federal response to an influence epidemic in the United States. The department is closely coordinating with Health and Human Services and CDC to monitor the situation." (Press Briefing on Swine Influenza with Department of Homeland Security, Centers for Disease Control and Prevention, and White House, April 26, 2009)

On June 11, the WHO raised the level of influenza pandemic alert to Phase 6 Pandemic Alert, indicating the start of an actual pandemic and reflecting spread of the H1N1 virus, not its severity. (R40560 The 2009 Influenza Pandemic: Selected Legal Issues Congressional Research Reports, June 15 2009) => https://crsreports.congress.gov/product/pdf/R/R40588; https://archive.org/details/r-40588

According to WHO, a pandemic is a worldwide epidemic that has to meet three conditions:

1. The microbe infects and causes serious illness in humans.
2. Humans do not have immunity against the virus.
3. The virus spreads easily from person-to-person and survives within humans. (World Health Organization. WHO global influenza preparedness plan. The role of WHO and recommendations for national measures before and during pandemics - March 2005)

One conflict presented in the June 11 2009 Congressional Research Reports stated, "The majority of patients that have had A H1N1 swine flu have experienced mild symptoms and made a rapid and full recovery."

Furthermore, as author **F. William Engdahl** notes, no "government or private agency in the world has yet to scientifically isolate, to photograph with means of electron microscopy and to list the chemical characteristics of the 'novel H1N1 Influenza A virus' as it is now officially called."

The Obama administration released stockpiles of Tamiflu and Congress was soon to approve $7.65 billion for the non-proven pandemic influenza. After pressured, (a spokesperson at an April 26 press conference asking twice before obtaining his answer), it was admitted that President Obama admitted had not used Tamiflu that he had been recommending to others.

Testing patients to see if they had of H1N1 was halted, so reports publicly being made about the extent of H1N1 are inaccurate. H1N1 symptoms are same or similar to any other flu. Nevertheless, a National Emergency is in force and raising public concern about the vaccine being fast-tracked and the military deployed on U.S. soil.

Giving children a fast-tracked experimental vaccination in schools is justifiably concerning. People living in oppressed (developing and least developing) countries given the fast-tracked, experimental vaccination is equally concerning.

Dr Keiji Fukuda, the WHO Assistant Director-General for Health Security and Environment, warned about potential dangers of the experimental H1N1 swine flu vaccine saying, "There are certain areas where you simply do not try to make any economies. One of the things which cannot be compromised is the safety of vaccines." (AP/CBS News, *WHO Flu Chief: No Compromise On Vaccine Safety UN Health Agency's Flu Chief: Safety Of Swine Flu Vaccine 'cannot Be Compromised',* July 24 2009) => https://www.cbsnews.com/news/who-swine-flu-could-infect-2-billion/

Who's in charge?

Reasonable grounds exist to believe that H1N1 vaccines might be mandatory in some states of the U.S. The primary authority for quarantine and isolation in the U.S. resides at the state level. States may be allowed to choose to either enforced mandatory vaccination or to allow "self-shielding and quarantine." (Congressional Research Reports, June 15, 2009) => https://web.archive.org/web/20101222101431/http://opencrs.com/document/R40560/2009-06-15/

Over one million Americans have sent emails demanding right to self-shield to Natural Freedoms Foundation (www.globalhealthfreedom.com) according to the organization's July 28, 2009 press release, but Congress has not passed a bill to this effect.

The U.S. Emergency Medical Powers Acts and Federal legislation, including Patriot Acts I and II plus, BARDA and others provide for mandatory vaccination or drugging with no exemptions (religious or otherwise). (*this document was not found*)

U.S. federal government has jurisdiction over interstate and border quarantine. Military enforcement of border entry and closing can occur according to Congressional Research Reports.

On June 17, 2009, Co-founder and President of the National Vaccine Information Center (NVIC), Barbara Loe Fisher called on Americans to become educated and act in responsible ways to defend their rights. (*this document was not found*)

NVIC is also calling on the Obama administration to answer a series of questions, including about the right for parents to say "No." (video)

=> **Don't Inject Me - Vmix** [ft. Barbara Loe Fisher & Ron Paul]
https://www.dailymotion.com/video/xacxki

The Natural Solutions Foundation July 28 press release states: "Americans, in record numbers, reject the notion that an untested, uninsurable, unsafe vaccine should be injected into their bodies and those of their children in a rush to "prevent" an inconsequential disease.

They understand that if the Swine Flu did mutate as threatened by WHO and CDC into a deadlier form, the Swine Flu vaccine in production now would be powerless to prevent it since once a virus undergoes significant mutation, any vaccine prepared for the previous version is totally ineffective against the new version."

World leading economist, Prof. Michel **Chossudovsky** maintains that the H1N1 epidemiological data is a "fabricated, falsified and manipulated" and political ploy to "create a crisis where there is no crisis." According to Chossudovsky, the WHO level six pandemic is diverting public attention from a social crisis "largely the consequence of a deep-seated global economic depression" and ushers Martial Law into the U.S. (Chossudovsky, Martial Law and the Militarization of Public Health: The Worldwide H1N1 Flu Vaccination Program, July 26 2009)

=> https://web.archive.org/web/20091108225252/http://globalresearch.ca/index.php?context=va&aid=14543

"The flu pandemic is used to foreclose organized resistance against the government's economic policies in support of the financial elites. It provides both a pretext and a justification to adopt emergency procedures.

Under the existing legislation in the US, Martial Law, implying the suspension of constitutional government, could be invoked in the case of "A Catastrophic Emergency" including a the H1N1 swine flu pandemic." (Chossudovsky, July 26 2009)

Two points that independent researchers agree related to H1N1 are: the "pandemic" will be highly profitable for corporations and will position the Pentagon for military control at a time of unprecedented, global economic collapse.

Alan Cassels, Arthur Schafer

What do we know about the vaccines' safety? Not enough

The Globe and Mail, 5 August 2009
https://www.theglobeandmail.com/opinion/what-do-we-know-about-the-vaccines-safety-not-enough/article4281224/
https://whoflu666canada.wordpress.com/category/uncategorized/

Who should be at the top of the list to receive the H1N1 vaccine or antiviral drugs if, as feared, they are in short supply? Bio-ethicists debate the niceties of how society should ration scarce medical resources, while public-health officials spend their days debating who should be first in line – pregnant women, health-care personnel or perhaps government leaders and corporate CEOs?

The majority of Canadians, listening to this rationing debate, would be forgiven for assuming that the H1N1 vaccine, when it becomes available in the autumn, will be a life saver. The unfortunate reality, however, is that we don't know and, indeed, can't know if that is the case.

Like most governments around the world, eager to appear to be "doing something," the government of Canada has promised to stockpile enough of the vaccine so that most Canadians will be protected.

But, speaking of stockpiles, Canada already owns one of the world's largest supplies of antiviral drugs, mostly Tamiflu and Relenza, two drugs designed to reduce the severity and length of the flu. And yet the scientific evidence testing the preventive benefits of either Tamiflu or its near cousin, Relenza, shows that both are pathetically weak. People who take either of these "prophylactically," i.e. before they become sick, hoping to prevent the flu, will get about as much effect as if they'd taken a placebo. That's not a very impressive result. Equally unimpressive: When the drugs are given within 48 hours to someone who already has flu symptoms, with the goal of ameliorating the severity of the disease, it makes only a slight difference. The "lucky ones" who take Tamiflu may reduce the average length of a five-day flu by about half a day. Not worth getting out of bed for, you might think. So perhaps it doesn't matter all that much who is at the top of the list to receive the drugs and who is at the bottom.

Consider also that a recent international study reveals that about 50 per cent of children who have taken Tamiflu experienced side effects. Most have been minor (gut problems, diarrhea) but some have been more serious, including neuropsychiatric problems. Why are public-health officials glossing over the fact there is a great deal of uncertainty and doubt surrounding the effectiveness, safety and side effects of flu drugs?

The same could be said for the H1N1 vaccine, currently in production and ramped up for Canada's fall flu season. What do we know about its effectiveness or its safety? The answer is, not enough. If one takes past flu campaigns as any indication, it is likely the effectiveness of the vaccine is going to be exaggerated, while the potential harms will either be ignored, understated or simply unknown. In that scenario, the rush to vaccinate yourself and your children might not turn out to be such a grand idea.

Public-health officials around the world seem to be suggesting there is a possibility this flu pandemic could get much worse, that is, become more lethal. If that were to happen, it seems

"obvious" that wise people should seek to have a preventive flu shot or access to a pill. Many people will say to themselves: Why not get the shot, just to be sure?

Part of the answer to that question is that until a million people roll up their sleeves to get the vaccine, no one can be sure how safe it will be. This is also a decisive answer to those who favour making vaccination mandatory.

Some public-health officials have described flu vaccines as "highly effective," but the internationally recognized Cochrane Collaboration (which accepts no money from the pharmaceutical industry) did a systematic review of all high-quality randomized trials (25 in all) studying influenza vaccination. They concluded that "the evidence does not support universal immunization of healthy adults." Period.

So how does this information help us to think clearly about the current flu pandemic in which we're mired?

Well, it seems that despite its spread, this flu virus is a bit of a dud for the fear-mongers. If, as seems not unlikely, the H1N1 virus mutates, our government will have purchased enormous quantities of a flu vaccine around which we will have virtually no safety or effectiveness data, and an already existing and very costly stockpile of probably useless drugs.

In short, a big bust all around.

Governments and public-health officials are sensitive to the exhortation: Don't just stand there, do something. But it's sometimes wise to reverse that dictum: Don't just do something, stand there (and think a bit about what might actually produce more good than harm).

Alan Cassels is a drug policy researcher at the University of Victoria. Arthur Schafer is director of the Centre for Professional and Applied Ethics at the University of Manitoba.

Who should be at the top of the list to receive the H1N1 vaccine or antiviral drugs if, as feared, they are in short supply? Bio-ethicists debate the niceties of how society should ration scarce medical resources, while public-health officials spend their days debating who should be first in line - pregnant women, health-care personnel or perhaps government leaders and corporate CEOs?

. . . . . .

Governments and public-health officials are sensitive to the exhortation: Don't just stand there, do something. But it's sometimes wise to reverse that dictum: Don't just do something, stand there (and think a bit about what might actually produce more good than harm).

H1N1 flu and the experimental vaccine secrets, lies, labs and profits

Examiner, 5 August 2009, 03:22, PM
https://web.archive.org/web/20100420013911/http://www.examiner.com/x-10438-Peace-Studies-Examiner~y2009m8d5-Part-2-H1N1-flu-and-the-experimental-vaccine-secrets-lies-labs-and-profits

In 2004, BBC UK reported that scientists showed that tiny changes to modern flu viruses could render them as deadly as the 1918 Spanish Pandemic that killed untold millions of people and infected half the world's population at the time. [*Killer flu recreated in the lab*. – BBC, 7 October 2004], http://news.bbc.co.uk/2/hi/health/3719990.stm

Today's H1N1 "Swine Flu" is a "split-influenza" virus, Bird-flu, Pig-flu and multiple strains of human flu (H3N2) from three Continents. Scientists genetically engineered H1NI according to experts such as science journalist Jane Burgermeister and investigative journalist, Wayne Madsen. While H1N1 constitutes a bio-weapon, independent scientists and investigative journalists are revealing evidence that the H1N1 vaccine is also a bioweapon, one with potential to cause greater harm than the H1N1 swine flu.

Similar to the 1918 Spanish Flu Pandemic, today's H1N1 swine flu's target is 20-45 year olds, "not the very young or very old," says Madsen. => https://web.archive.org/web/20210211233632/http:/www.youtube.com/watch?v=RnSX_jS0STA&eurl=http%3A%2F%2Fwww%2Einfowars%2Ecom%2Fflu%2Dpandemic%2Dmass%2Dgraves%2Dand%2Dmartial%2Dlaw%2F&feature=player_embedded

After a great race, the 1918 Pandemic virus strain was isolated from a body buried in permafrost, copied, stored by molecular pathologists, reassembled and distributed to agencies and pharmaceutical companies around the world.

On April 22, 2009, CNN reported the disappearance of vials of "a potentially dangerous virus" from Fort Detrick, home of the Army's top biological research facility.
See => http://edition.cnn.com/2009/US/04/22/missing.virus.sample/index.html

"Every major media outlet has reported the fact that US/UK bioterrorists have been manipulating the avian flu virus in university and Army labs," writes Lori Price of Citizens for Legitimate Government.
See => https://web.archive.org/web/20090429084931/http:/www.legitgov.org/flu_kills_torture_memos_260409.html

Drug companies involved

Over three years ago, Novartis applied for a patent that, in February 19, 2009, to which the U.S. Patent Office granted and issued US 20090047353A1 for a "Split Influenza Vaccine with Adjuvants."

A year before any reported "alleged H1N1" case, Baxter applied for an H1N1 vaccine, Baxter Vaccine Patent Application US 2009/0060950A1. (See William Engdahl, *Now legal immunity for swine flu vaccine makers*, Global Research, July 2009).

Two Baxter AG facilities then sent 72 kilos of live pandemic flu virus to 16 laboratories in 4 countries resulting in death and sickness, according to Burgermeister. Baxter, with GlaxoSmithKline, Novartis, Sanofi-Aventis and AstraZeneca, was then rewarded with procurement contracts with some 50 governments. The WHO refuses to release Minutes of a key meeting of an advisory vaccine group "packed with the executives" of Big Pharma. => https://www.reuters.com/article/idUSSYD537212

Novartis, headquartered in Basel, Switzerland with over $53 Billion USD revenue generated in 2008, is the world's largest, multi-national pharmaceutical company. It began as a component of the infamous I.G. Farben, responsible for the rise of Adolph Hitler and the German/Austrian Third Reich.

Pregnant women are among the first to trial the vaccine

The Baxter Vaccine application states, "Suitable adjuvants can be selected from mineral gels, aluminium hydroxide, surface active substances, lysolecithin, pluronic polyols, polyanions or oil emulsions such as water in oil or oil in water, or a combination thereof. Of course the selection of the adjuvant depends on the intended use, e.g. toxicity may depend on the destined subject organism and can vary from no toxicity to high toxicity." (William Engdahl, July 2009).

Numerous health and science reports convey that H1N1 vaccine will contain mercury. See: Luis R. Miranda. H1N1 Flu Vaccine Contains Mercury, Adjuvants, Squalene. – Associateds ... 1 August 2009 =>https://web.archive.org/web/20100225155848/http://www.associatedcontent.com/article/2008884/h1n1_flu_vaccine_will_contain_mercury.html?cat=5

Mercury in its most common form, Thimerosal, is in most vaccines available to the public, usually as a preservative. It is mercury, Thimerosal that Robert F. Kennedy Jr. has investigated and warns the public to avoid. Thimerosal has been removed from childhood vaccines because of fear it causes autism, yet it is being used in some batches of the H1N1 vaccine.

Authorities say on mainstream TV, CBS with Katie Couric, that mercury is no problem. On July 30, Secretary of Health and Human Services Kathleen Sebelius said on the program, "study after study, scientist after scientist, has determined that there really is no safety risk with thimerosol."
=> Web Exclusive: Sebelius on Vaccine Fears. – CBS News, 30 July 2009
https://web.archive.org/web/20100104120146/http://www.cbsnews.com/stories/2009/07/30/eveningnews/main5199450.shtml

In the book, *More Than Genes*, Dan Agin adds to scientific evidence that fetal environment is as crucial as genetic hard-wiring or even later environment in determining intelligence and behavior. Despite this evidence, pregnant women will be included in H1N1 flu vaccine trials (U.S. News & World Report, Pregnant Women Will Be Included in H1N1 Flu Vaccine Trials, 30 Jul 2009)

The panel of experts convened by the Centers for Disease Control and Prevention recommended on July 29 that the new vaccine be provided first to pregnant women and adults with compromised immune systems, who face a greater risk of complications. => *Pregnant Women Will Be Included in H1N1 Flu Vaccine Trials*. – U.S. News, 30 July 2009. => http://health.usnews.com/blogs/on-women/2009/07/30/pregnant-women-will-be-included-in-h1n1-flu-vaccine-trials.html

Dr. Rima Laibow, MD., Natural Solutions Foundation Medical Director, concurs with many ethical scientists in that vaccines are not in best interest of the public: "[V]accines are explicitly acknowledged not to protect against diseases they supposedly are designed to prevent (read the Package Inserts for vaccines, available on line and in your doctors' offices if you doubt that) and often" cause them. Yet they continue in use because they're so "immensely, enormously and hideously profitable," and Big Pharma has enough clout to proliferate products that "in a rational society (would) be banned forever."

Obedience to destructive authority

After an intensive marketing campaign, 46 million Americans obediently took the 1976 flu shot resulting in 4,000 Americans claiming 3.5 billion dollars in damages from the government amounting, 2/3s for neurological damage and 300 deaths allegedly triggered by the flu shot. (CBS, 60 Minutes, 1979)

Stanley Milgram's original 1960's obedience experiments showed that 65% of participants asked to deliver electrical shocks to a "learner" who gave an incorrect answer, were willing to deliver the maximum level of shocks despite the learner seeming seriously distress or even unconscious. Regardless of expected pain or suffering resulting form the orders, when an authority gave the orders, 65% of individuals did as told.

A similar study showed an even higher level of obedience to destructive authority than Milgram's. This study, in the Netherlands, researched employees obeying orders to use psychological-administrative violence resulting in definite harm.

Subjects were ordered to disturb an make nervous job applicants so that the applicant remained unemployed. Over 90% of the subjects obeyed these destructive orders to be violent. (Wim H. J. Meeus, Quinten A. W. Raaijmakers, *Administrative Obedience: Carrying Out Orders to use Psychological-Administrative Violence,* Faculty of Social Sciences, University of Utrecht, Heidelberglaan 2, 3584 CS Utrecht, The Netherlands)

Drug-related violence against self and others, such as offspring, through a vaccine is an issue that warrants family and community learning meetings. Despite people working for the greater good advising the public to not take the vaccine, the former "Just Say No" drug campaign proved to be an expensive failure.

Gathering with family, neighbors and community to learn from each other and plan is one of the most effective ways to manage this latest manufactured crisis.

DAILY EXPRESS
CRUSADING FOR A FAIRER BRITAIN

Martyn Brown

Fears as pupils get Swine Flu jab

Daily Express, 7 August 2009
https://web.archive.org/web/20090814131926/http://www.express.co.uk/posts/view/119175/Fears-as-pupils-get-swine-flu-jab

Parents' fears were growing last night over plans to use Britain's 8.5million schoolchildren as guinea pigs for swine flu vaccinations.

The Government has drawn up drastic plans to immunise every schoolchild in the UK.

In the biggest mass vaccination since the 1964 operation against smallpox, school nurses, health visitors and GPs would deliver the injections to five to 16-year-olds at all 33,700 schools.

The programme could start at the beginning of the new school term in a major effort to minimise the harm caused by a second wave of the pandemic this autumn.

But there are serious concerns as little or no data exists on the safety or effectiveness of flu vaccines on young children.

However, the Department of Health stressed that no decision had been made on delivering the vaccination programme.

Jackie Fletcher, who runs Jabs, a support group for parents whose children have been affected by vaccines, said the Government could end up with unnecessary deaths on their hands if proper tests are not carried out.

She said: "We have got major concerns about the safety of these vaccines.

"No children or anyone else for that matter should be used as guinea pigs for something like this. There are too many unknowns.

"With millions of people vaccinated the chances of serious side effects, possibly fatal, are very real indeed."

She pointed to America in 1976 when the government vaccinated 45 million people for a swine flu outbreak that never materialised.

A total of 500 people developed a rare neurological condition called Guillain-Barre syndrome and 25 died.

Ms Fletcher said: "We simply cannot run that risk in Britain. Any vaccinations in September or October are too early. This is a knee-jerk reaction by the Government."

Peter Smith, professor of tropical epidemiology at the London School of Hygiene and Tropical Medicine, said: "What happened in America has never really been understood.

"It's not really been observed with subsequent influenza vaccines," said Professor Smith, who is chairman of the global advisory committee on vaccine safety at the World Health Organisation.

Parents would need to give permission for a child to be vaccinated. But there are questions over whether there will be enough health professionals to carry out the vaccinations – there are just 1,447 nurses covering 25,000 schools in England.

Government figures showed the number being diagnosed dropped from 110,000 to 30,000 over the past seven days. But there have been nine new deaths related to the virus in the last week, and 36 people have now died.

Chief medical officer Sir Liam Donaldson has predicted a "second wave" when schools reopen.

Meanwhile, the country's first swine flu vaccine trial is being held at Leicester Royal Infirmary.

Part 3
H1N1 vaccine for profit and U.S. martial law factor

Examiner, 7 August 2009, 5:28 PM
https://web.archive.org/web/20100104101656/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m8d7-Part-3-H1N1-vaccine-for-profit-genocide-and-the-US-martial-law-factor#comments

On June 10 2009, Austrian science investigative journalist, Jane Bergermeister filed bioterrorism criminal charges against the WHO, United Nations, high-ranking US officials, and business executives. Officials allegedly conspired to create a pandemic, deliberately releasing it to trigger mass compulsory injections with intent of genocide and profit.

Cost of the 2009 H1N1 vaccine is almost $10.00 USD per person, less in oppressed (Developing and Least Developed) countries (Business Week, July 2009), a multi-billion dollar, biotech and pharmaceutical operation bonanza.

We are seeing a crime committed against civilians and soldiers by high members of government, a tiny group of people undermining safety and security of their own people, acting on behalf of an international cartel, according to Burgermeister.

H1N1 swine flu strain is a US classified bioweapon according to Bergermeister's criminal complaint evidence filed with the Federal Bureau of Investigations. *Bioterrorism evidence* – read here => https://dokumen.tips/documents/evidence-of-the-use-of-pandemic-flu-to-depopulate-usa.html?page=1

Baxter, Novartis, Glaxo-Smith Kline, and Sanofi Pasteur executives have seats on the advisory group that on July 13th, recommended mandatory H1N1 vaccination of everyone in all 194 countries that belong to the WHO according to Burgermeister.

Bergermeister's criminal allegations are consistent with Washington's imperialism agenda, extending frontiers of the American Empire to facilitate complete U.S. corporate control, while installing within America, the institutions of the Homeland Security State.

U.S. planned military dictatorship

With little fanfare or public response, G.W. Bush diminished Posse Comitatus, making martial law, military patrol in the U.S., legal.

On October 1, 2008, with minimal mainstream media coverage, three to four thousand soldiers of the First Brigade of the Third Infantry Division quietly deployed in the U.S. Their stated mission: crowd control that they practiced in Iraq, subduing "unruly individuals," and management of a national emergency.

In April 2009, the US Departments of Health and Homeland Security predictably declared a national public health emergency based on the swine flu outbreak. In mid-June, 2009, WHO declared a "Level 6" pandemic.

The U.S. Emergency Medical Powers Acts and Federal legislation, including Patriot Acts I, II and III, BARDA and others, provide for mandatory vaccination or drugging with no exemptions (religious or otherwise). (See Michel Chossudovsky, Global Research)

At the state level, those who refuse the vaccine are subject to immediate incarceration and quarantine of indefinite length, classified as felons "Vaccine Resisters," equated to a new form of "terrorism," at the State level. At the Federal level, those who refuse will be subject to immediate incarceration and quarantine. FEMA camps are established across the U.S.

At the time of this writing, the H1N1 vaccination is not mandatory according to the Health and Human Services Secretary, Kathleen Sebellius CBS interview with Katie Couric on July 30. The abovementioned legislation exists, however, for the possibility of mandatory vaccination. =>

Web Exclusive: Sebelius on Vaccine Fears. – CBS News, 30 July 2009
https://web.archive.org/web/20100104120146/http://www.cbsnews.com/stories/2009/07/30/eveningnews/main5199450.shtml

The sole measure that would help ensure that Americans have another choice besides vaccination or incarceration is self-shielding. Congress has not yet to passed this legislation, as highlighted in Part 1 of this series. => https://web.archive.org/web/20100418175845/http://www.examiner.com/x-10438-Peace-Studies-Examiner~y2009m8d2-Part-1--The-global-economic-crisis-H1N1-experimental-vaccination-martial-law-and-eugenics-story

Furthermore, G.W. Bush *changed the Constitution* to suspend habeas corpus that since 1807, prevented citizens from seizure by the state and held without trial. President Obama did not restore this Constitutional right. Now, "Vaccine Resisters" can be identified as "insurgents" or "terrorists" and with army force, be seized, imprisoned and held indefinitely with no recourse, just as Americans justified doing to foreigners.

President Obama is considering taking the police state further in signaling he is about to begin 'preventive detention,' empowering him to hold forever an unspecified number of prisoners without charges or trial. [I]ndefinite preventive detention is, of course, the foundation of a police state," writes Naomi Wolf in *The Bush in Obama* published in Sunday Times. (Naomi Wolf, *The Bush in Obama*, Sunday Rimes, August 2, 2009) => https://www.sundaytimes.lk/090802/International/int01.html

"Obama's Justice Department has invoked Bush's argument that the State Secrets Act bars evidence about torture from being disclosed, which means that anyone who was tortured can never appear in court. Moreover, Obama has …done nothing to roll back the Patriot Act." (Wolf, Naomi)

Overriding the President and Commander in Chief and without consulting the US Congress on the issue, the Pentagon is planning how many more troops to deploy in the U.S. for mass vaccination, according to Chossudovsky.

If this happened in a developing nation, many people would justifiably call it a military coup.

According Brig. Gen. Robert Felderman, deputy director of USNORTHCOM's Plans, Policy and Strategy Directorate: "USNORTHCOM is the global synchronizer – the global coordinator – for pandemic influenza across the combatant commands"(emphasis added)

See Gail Braymen, *USNORTHCOM contributes pandemic flu contingency planning expertise to trilateral workshop*, USNORTHCOM, April 14, 2008, Also see *USNORTHCOM. Pandemic Influenza Chain Training* (pdf) (Chossudovsky, 2009)

https://web.archive.org/web/20100213103744/http://www.northcom.mil/Avian%20Flu/index.html
https://web.archive.org/web/20100106084531/http://www.northcom.mil/news/2008/041408.html &
https://web.archive.org/web/20100213103708/http://www.northcom.mil/Avian%20Flu/docs/Pandemic_Influenza_Training_Brief.pdf

Perhaps a predicted success of the orchestrated attempt to spread fear and chaos into the population, so that people are vaccinated, requires military control. Martial law might be instated when the manufactured, worst economic crisis in history plummets further, as ethical economists are predicting an inevitable reality. Whichever prompts the more overt martial law, the troops are on U.S. soil and the military is ruling.

Part 1: https://web.archive.org/web/20100418175845/http://www.examiner.com/x-10438-Peace-Studies-Examiner~y2009m8d2-Part-1--The-global-economic-crisis-H1N1-experimental-vaccination-martial-law-and-eugenics-story

Part 4
Warning in the eye of the H1N1 false flag storm

Examiner, 14 August 2009
https://web.archive.org/web/20100418034041/http://www.examiner.com/x-10438-Peace-Studies-Examiner~y2009m8d14-Warning-in-the-eye-of-the-false-flag-storm-H1N1-political-objective

Today's bio-engineered H1N1 pandemic - experimental vaccine crisis lies deep in military, political and industrial interests. [Arthur Cristian, author of *Medical Mafia*, *Love For Life*]
=> https://web.archive.org/web/20090625001303/http:/www.loveforlife.com.au/node/6636

The pandemic objective is "to undermine all forms of opposition and social resistance," writes Chossudovsky. [Michel Chossudovsky, *Martial Law and The Militarization of Public Health*, Center for Global Research, July 26, 2009]
=> https://web.archive.org/web/20100508231338/http://globalresearch.ca/index.php?context=va&aid=14543

In plain view is the applied standard psyop: 'Create the problem. Cause the crisis. Intervene to complete the agenda,' an agenda that includes high profits and forced depopulation.

Manufactured crises psyop in a programmed nation

Chossudovsky explains that the global economic crisis is based on the fake "global war on terrorism," central to misleading public understanding that the Middle East War is actually a battle to control extensive oil and natural gas reserves.

Josh Tickell's multi-award winning movie, *Fuel,* due for wide release this fall, documents this aim of the so-called war on terror, through footage of congressional sessions, investigations and spokespersons such as *Scott Ritter*, former US weapons inspector.

People who continue to support the bogus "war on terror" and accept political lies are programmed by what Chossudovsky explains, their "inner consciousness" warning them "terrorists are threatening their livelihood." Such was the purpose of the 9/11 shock and awe.

It is in this collective psyche framework of induced fear and revenge that support for killing people for their oil and minerals exists, and that manufactured 'natural disasters', 'pandemics', 'environmental catastrophes' have a useful political role.

These crises, developed, tested and refined over decades to appear natural, distract from the real, inevitable, economic crisis, plus they distort real causes and agenda according to Chossudovsky.

The laboratory manufactured H1N1 and "pandemic" justify the global public health emergency on humanitarian grounds, with predictable repercussions to the unsuspecting public.

WHO predicts one-third of the world's population could be infected with H1N1, a prediction Chossudovsky and others with no vested interest show is miscalculated, but serves the power elite agenda of controlling humanity and "erasing" people through their fear and lack of accurate information.

The computer driven Phoenix Program in Vietnam that aimed at "erasing" targeted individuals and groups and "pacifying" the rest, resulted in mass murders of over 20,000 civilians and rampant torture. Adviser to General Petraeus called for a "global Phoenix Program." (Tom Hayden*, Reviving Vietnam War Tactics, The Nation,* March 13 2009) ref: Kilcullen D. Countering Global Insurgency. – J Strategic Studies, 2005, 28(4): 597-617.
https://web.archive.org/web/20080317002630/http:/www.thenation.com/doc/20080331/hayden

Too great a leap? Dr. Tue Ott PhD, ND recently stated, "Specific programs are designed to kill large amounts of people for specific political purposes worldwide, and it is does this in every single case by first introducing a vaccine to unsuspecting population centers." Ott presents what he calls "life-saving truth" in a 2-hour video, *Bird Flu Hoax*. =>
https://web.archive.org/web/20120124122230/http://www.youtube.com/watch?v=wW11wZOmdSA&feature=related

Eugenics

A 1974 memo (now declassified), *National Security Study Memorandum NSSM 200 Implications of Worldwide Population Growth For U.S. Security and Overseas Interests,* known as the *Scowcroft Document* (authored by Brent Scowcroft of the Council on Foreign Relations who became National Security Advisor) or NSSM 200, states U.S. government plans to depopulate the world to maximize profits. [*NSSM 200 The Kissinger Report*]

This document became the official guide for U.S. foreign policy on November 26, 1975. (Stephen Mumford, *National Security Study Memorandum 200: World Population Growth And U.S. Security*, The Center for Research on Population and Security (CRPS), *Insight into Solving the Problem of over-population – the overwhelming Issue of Our Time…Vital to the Security of Communities and Nations*) => https://web.archive.org/web/20090820223056/http://www.population-security.org/mumf-93-01.htm

Due to the "bold nature of the suggested initiatives," *NSSM 200* authors recommended keeping the report secret "to provide time to educate the American public as to the necessity of these initiatives." (Emphasis added) The document was kept from the public for fourteen years for the "education strategy" to be implemented.

NSSM 200, with input from department heads of the CIA, Defense, Agriculture and International Development, is a blueprint for U.S. foreign policy: reducing worldwide population with "concentration on key countries." The document's stated twofold reason to reduce world population is:

"The United States has become increasingly dependent on mineral imports from developing countries" and " endemic famine, food riots, and breakdown of social order... are scarcely inducive to systematic exploration for mineral deposits or the long-term investments necessary for their exploration."

One can surmise that "breakdown of social order" stated in the document refers to predictable populations revolting against their living conditions.

NSSM 200, evidences Dr. Henry Kissinger proposing, '[D]epopulation should be the highest priority of U.S. foreign policy towards the Third World.' Leuren Moret writes about Kissinger's input:

"He quoted reasons of national security, and because (t)he U.S. economy will require large and increasing amounts of minerals from abroad, especially from less-developed countries... Wherever a lessening of population can increase the prospects for such stability, population policy becomes relevant to resources, supplies and to the economic interests of U.S." (Leuren Moret, *From Hiroshima to Iraq, 61 years of uranium wars A suicidal, genocidal, omnicidal course, Global Research,* 2007)
=> https://web.archive.org/web/20100414035526/http://www.globalresearch.ca/index.php?context=va&aid=5949

***NSSM 200* clearly reveals** attempts to hide U.S. motives involving oppressed nations, and even recommends a strategy to manage this:

"It is vital that the effort to develop and strengthen a commitment on the part of the LDC [Least Developed Nation] leaders not be seen by them as an industrialized country policy to keep their strength down or to reserve resources for use by the `rich' countries… Development of such a perception could create a serious backlash adverse to the cause of population stability..." (page 114).

"The US can help to minimize charges of an imperialist motivation behind its support of population activities by repeatedly asserting that such support derives from a concern with: (a) the right of the individual to determine freely and responsibly their number and spacing of children ... and (b) the fundamental social and economic development of poor countries...." (page 115).

One of the document's stated conclusions is that "*mandatory population control measures*" may be "appropriate."

WHO spokesman Dick Thompson told The Associated Press, "Severity [of H1N1] is going to be different in different countries. And within a country, it will be different in different populations." (Scripps Newspaper Group, Online The E.W. Scripps Co.)

https://web.archive.org/web/20100131155631/http://m.reporternews.com/news/2009/May/18/nations-urge-who-to-change-pandemic-definition/

Dr. Mercola explains that "squalene," an adjuvent that causes the immune system to overreact, is dangerous to human health when injected [as opposed to taken in orally]. (*Squalene,The Swine Flu Vaccines Dirty Little Secret Exposed*) Gulf War syndrome is related to squalene in army vaccines. Novartis and GlaxoSmithKline, are using squalene as an adjuvant in their H1N vaccines says Mercola.

Will people in oppressed countries and communities, with less access to internet and vaccine danger information, have an educated choice about being vaccinated? Will they see the industrialized country policy to keep their strength down and to reserve their resources by and for the `rich' countries? How about Earth's oldest living culture, the Australian Aborigines?

Indigenous Australians (and pregnant women) are likely priorities for vaccination according to Queensland, Australia chief health officer, Dr Jeannette Young. (Steve Gray, *Swine flu vaccine priorities being set,* WAToday.com, August 3, 2009) =>

https://web.archive.org/web/20090922094230/http://www.watoday.com.au/breaking-news-national/swine-flu-vaccine-priorities-being-set-20090804-e7fn.html

Young's statement followed the July 29 U.S. Center for Disease Control and Prevention (CDC) announcement that, "Pregnant women, health care workers, and children who are aged 6 months and older should be the first to receive this fall's H1N1 swine flu vaccine." =>

https://web.archive.org/web/20121216160500/http://www.modernmedicine.com/modernmedicine/Nursing/Pregnant-Women-Children-Among-H1N1-Vaccine-Priorit/ArticleNewsFeed/Article/detail/615086

For years, Robert F. Kennedy Jr. has researched and warned Americans about vaccine dangers and cover-ups:

"The story of how government health agencies colluded with Big Pharma to hide the risks of thimerosal from the public is a chilling case study of institutional arrogance, power and greed. I was drawn into the controversy only reluctantly. As an attorney and environmentalist who has spent years working on issues of mercury toxicity, I frequently met mothers of autistic children who were absolutely convinced that their kids had been injured by vaccines. ... 'The elementary grades are overwhelmed with children who have symptoms of neurological or immune-system damage,' Patti White, a school nurse, told the House Government Reform Committee in 1999. 'Vaccines are supposed to be making us healthier; however, in twenty-five years of nursing I have never seen so many damaged, sick kids. Something very, very wrong is happening to our children.' (Robert F. Kennedy Jr, *Vaccinations: Deadly Immunity*, June 2005.)

Robert Kennedy on the Vaccine Autism Coverup = > https://www.youtube.com/watch?v=zrIM2hwrLoc

Vaccinating pregnant women globally is as odd as targeting Aborigines when the official story is that H1N1 mostly impacts 20-40 year olds plus any drug intake during pregnancy can have severe, lifelong adverse foetus impact, often not observable for years.

Some U.S. congresspersons concur with Chossudovsky's political analysis related to H1N1. Ron Paul warns the public about the vaccine and related propaganda.

Civilian Inmate Labor Program

Geopolitical events related to this H1N1 bio-engineered disease, the new great depression, and martial law, planned for decades are now steadfastly unfolding and will impact the reader's life, regardless of where home is, according to Chossudovsky.

In a congressional address in December 2008, Ron Paul (R-Texas) warned about abolishing the Insurrection Act of 1807 and Posse Comitatis of 1877 with this, stating that the very title of "Enforcement of the Laws to Restore Pubic Order Act" is "hardly a title that suggests the authors cared about the nature of a Constitutional Republic."

The US president can declare Martial Law for natural disasters, public health reasons, other attacks or "vague reasons" called "other conditions" without Congressional or governor approval and send state guard troops to other states, yet Americans continue to quote protection from martial law under the Insurrection Act and Posse Comitatis, crystallizing the lack of understanding these parts of the U.S. Constitution have been voided under former administrations.

As Ron Paul stated, "The stage is set for our country to be in remnant status... to evolve into a military dictatorship" in which few are aware of seriousness of this and "few seem to care."
https://www.youtube.com/watch?v=BnPV2xea2ro&list=PLC85B443202A518A5
https://www.youtube.com/playlist?app=desktop&list=PLC85B443202A518A5

On August 11, Georgia Congressman Paul Broun warned town hall event attendees that the Obama administration has been planning to use a pandemic or natural disaster to implement martial law in the U.S. (Paul Watson, *Congressman Obama Could Use Pandemic To Declare Martial Law*, August 11, 2009) =>
https://web.archive.org/web/20100111144106/http://justgetthere.us/blog/archives/Congressman-Obama-Could-Use-Pandemic-To-Declare-Martial-Law.html

US Army "Civilian Inmate Labor Program" are "for establishing and managing civilian inmate labor programs on Army installations (Army Regulation 210-35 Summary, Jan. 2005, p.3) where citizen detainees will be "assisted to return to productive life." After these camps have been empty for years, National Guard is now advertising for Americans to run "Enemy Prisoner of War/Civilian Internee (EPW/CI) camp" in the U.S.

Who's doing what and who cares?

Congress had done nothing to revise the Defense Authorization Act and the Enforcement of the Laws to Restore Pubic Order Act that allow martial law.

Vermont Gov. Jim Douglas (R), chairman of the National Governors Association, and Vice Chairman Gov. Joe Manchin (D) of West sent a letter to the Pentagon last week, condemning the DoD plans to usurp domestic control of National Guard and deploy federal forces in the event of a natural disaster or terrorist attack according to Stephen Webster. (Reid Wilson, *Governors oppose DoD emergency powers*, *The Hill*, August 10, 2009)
https://web.archive.org/web/20090812065154/http:/thehill.com/leading-the-news/governors-oppose-dod-emergency-powers-2009-08-10.html

Top corporate leaders of many companies and industries, will meet with distinguished scientists, public health officials, law enforcers, first responders, and other experts, to learn about forced quarantines, mass vaccinations, and how to "control and diffuse social unrest and public disorder." (Kurt Nimmo, *Preparing for Martial Law: International Swine Flu Conference to Be Held in Washington*, Global Research, August 8, 2009.)
https://web.archive.org/web/20090810020453/http:/www.globalresearch.ca/index.php?context=va&aid=14705

Neighbors in communities across the nation, have been secretly training since 1996 at local InfraGard meetings, turning in names to the FBI and planning widespread crisis response, including how to shoot to kill if need be, **when** martial law is declared. (Matthew Rothschild, *The FBI Deputizes Business, The Progressive*, March 2008)
https://web.archive.org/web/20080214145659/http:/www.progressive.org/mag_rothschild0308

Militia members throughout the country equate the vaccine to assault with a deadly weapon and are on alert, organizing to resist military forced vaccinations.

Sheriff Mack, author of "No Sheriff Left Behind" who honors on his website front page Maricopa County Sheriff Arpaio, is attempting to organize Sheriff resistance to federal orders that violate the (now all but defunct) Constitution.

Clergy trained in "Clergy Response Teams" to support the military dictatorship are ready to step in line with military dictatorship in the name of religion.

Mainstream media personnel continue to disparage facts about the dangerous H1N1 vaccine, as they did with Robert F. Kennedy Jr.'s mercury research, and in so doing, are participating in a Phoenix Program-type pacification program.

Hopefuls believe that many hundreds of thousands of messages demanding right to Self-Shield, instead of vaccination or internment to decision makers on State and Federal levels could prevent this researched, developed and refined plan.

Barbara Lowe Fisher and her NVIC team have coordinated "*Show Us the Science* & *Give Us a Choice*" international conference with presenter Gary Null, a host of other presenters and participants from Canada, Netherlands, Israel, Philippines, Pakistan, New Guinea, United Kingdom, Italy, Japan, Rwanda, Cameroon, Afghanistan and many more concerned about vaccine safety and right to vaccine choices. They will meet with Congress persons on Capitol Hill and say that Washington, DC is the place to be October 1- 5, 2009.

https://web.archive.org/web/20100305123629/http://www.nvic.org/Events/Vaccine-Conference-2009/Overview.aspx

Citizenry community learning and responsible action to prevent fascists' ultimate weapon of mass destruction and control is acute (in industrialized countries and those more oppressed "Developing" and "Least Developed") in best interest of self, families, fellow Americans, and neighbours overseas.

To instead view the masses participating in daily lives as usual, in the eye of the false flag storm, leads to justifiable questioning whether the ultimate powers' new global Phoenix program, including a national high-tech, wide scale pacification component, is in effect.

Many people, just as the Scowcroft Document strategy aimed, are stepping in line with its depopulation propaganda, some even commenting that Earth needs a pandemic since too many people inhabit it. ... The public is "educated."

THE FLU CASE

Rebecca Em Campbell

Complaint to stop enforced vaccinations

The Flu Case, 16 August 2009

https://web.archive.org/web/20090919032722/http://www.theflucase.com/index.php?option=com_content&view=article&id=352%3Acomplaint-to-stop-enforced-vaccinations-in-washington-state&catid=1%3Alatest-news&lang=en

Rebecca Campbell in seattle has prepared this Complaint below and is ready to file in the Washington State Superior Court on Monday. She aims to get a court ruling that requires the Washington State government to refrain from ever implementing any forced mass "swine flu" vaccination programme if and when ordered by the Federal Government.

The Superior State Court can rule on a state's rights issue. The issue at stake here is whether the governor of Washington State can be forced to obey an unlawful order from the Federal Government? If the Governor of Washington State obeys an unlawful order from the feds, is there relief from the state courts?

In The Superior Court щf King County, Washington Case No. ________________

Rebecca Em Campbell-Unrepresented Plaintiff 107 Pine St., No. 332 Seattle, WA 98101-1550 (206) 926-3962 (206) 926-3962 rebeccaphb@yahoo.com

vs.

Christine Gregoire-Governor, Washington State PO Box 40002 Olympia, WA 98504-0002 (360) 902-4111 (360) 902-4111

Rob McKenna-Attorney General, Washington State 1125 Washington Street SE PO Box 40100 Olympia, WA 98504-0100 (360) 753-6200 (360) 753-6200

Mary Selecky-Secretary Washington State Health Department 101 Israel Road SE Tumwater, Washington 98501 (360) 236-4030 (360) 236-4030

Susan Dreyfus-Secretary Washington State Department of Social & Health Services PO Box 45130 Olympia, WA 98504-5130 (800) 737-0617 (800) 737-0617

Complaint petitioning the court to declare all possibly imminent federal executive orders/international treaties null and void unless conformant with the washington state declaration of rights

1. Rebecca Em Campbell is a Washingtonian with unalienable rights granted by the Creator. She comes before the court unrepresented. She has never knowingly, willingly and/or intentionally waived or assigned any of her unalienable rights. Any presumptions to the contrary are hereby rebutted.

Почему бесполезна вакцина от свиного гриппа?
Похоже, мы будем бессильны перед вирусом.

Комсомольская Правда, 18 августа 2009, 20:50
WWW.KP.RU: https://www.kp.ru/daily/24344/534563/

В России вот-вот начнутся испытания вакцины от H1N1 на добровольцах. Но это не значит, что грипп будет побежден.

Достаточно развеять некоторые мифы о прививках.

МИФ 1. Если привился – не заболеешь. Это не так. Заболеть можно. Прививают людей для того, чтобы избежать осложнений. А на счет свиного гриппа медики прогнозируют: прививка может быть бесполезна. Хуже того, она может оказаться опасной.

- Вообще вакцина против гриппа – это очень плохо для организма, - говорит специалист компании «Фармэксперт» Давид Мелик-Гусейнов. – Один сезон ты прожил на вакцине, второй… В итоге иммунитет все меньше и меньше способен отвечать на атаку вирусов. И если ты не привьешься или будут серьезные изменения в структуре вируса (например, на смену обычному сезонному гриппу придет свиной), заболеть можно очень серьезно. С осложнениями.

МИФ 2. Прививка дает стабильный иммунитет.

Против гриппа вообще не может быть стабильного иммунитета! Если его «искусственно» прививают , за три - четыре месяца он все равно пропадает. То есть за сезон можно переболеть одним и тем же гриппом несколько раз.

Сам грипп постоянно мутирует. Каждые 2-3 месяца. Вакцину делают на основе «старого» штамма. И бог его знает, во что превратиться H1N1 к этой зиме…

МИФ 3. Вакцина будет бесплатная

Будет. Но не для всех. В кулуарах ходят слухи – правительство выделит на резервную вакцину от свиного гриппа 4 миллиарда (!!!) рублей. Нехилая денюжка. Но даже ее на всех не хватит.

Бесплатно прививать станут обычный контингент: врачей, милиционеров, водителей общественного транспорта, школьников, детсадовцев, пенсионеров.

Желающие из взрослого работающего населения будут прививаться за свой счет.

Хорошая вакцина от обычного гриппа стоит 500 рублей. Уж на "свином" – то дельцы обязательно начнут спекулировать! И на других противогриппозных средствах. Как пить дать. А мы – начнем покупать. Куда денешься… А вы что по этому поводу думаете?

ABC News

Swine flu vaccine strategy 'risky'
The Australasian Society for Infectious Diseases says
there is no need for urgent mass vaccination

ABC News, 20 August 2009, 9:00 pm AEST
https://web.archive.org/web/20100131054502/http://www.abc.net.au/news/stories/2009/08/20/2662321.htm

The country's top infectious diseases body has written to the Government to warn the swine flu vaccine is being distributed too hastily, with too many risks for the public.

The Australasian Society for Infectious Diseases says the multi-dose vials which the vaccine will be distributed in have been shown to transmit infection, spread HIV and hepatitis, and even cause death.

Federal Health Minister Nicola Roxon says the Government expects to receive 2 million doses by the end of next week, and a widespread immunisation program could start by mid-September.

But the infectious diseases doctors say the swine flu threat has now passed and there is no need for urgent mass vaccination.

"To rush to a massive vaccination using multi-dose vials that have been associated with problems in the past, seems too hasty and perhaps not measured enough for our society," said Dr Tom Gottlieb, the president of the Australasian Society for Infectious Diseases.

The doctors are worried about the method that will be used to deliver the swine flu vaccine when the national immunisation program starts in the next few weeks.

The plan is to use multi-dose vials of the vaccine, which means a health worker will use needles to take more than one dose out of each vial.

"There have been episodes of bacterial contamination of vaccines, where there has been perhaps a bacterial organism growing in the vaccine, and when the patient's been injected they may have become infected with a bacteria," Dr Gottlieb said.

"Now that's largely been addressed with preservatives that are used in vaccines, but nonetheless there are potentials for viruses from one patient to be transmitted if vaccination is not done correctly.

"And in most circumstances it would be done correctly, but when things are rolled out hastily and multi-dose vials are used that potential exists.

"And there are certainly examples of spread of infection between patients with HIV, hepatitis B, hepatitis C and so on, and that's our concern."

The group of infectious diseases doctors is so concerned that they have written to Australia's chief medical officer Jim Bishop, urging him to reconsider the vaccination strategy.

In the letter the doctors point out that many international agencies, including The World Health Organisation, prefer the use of single-dose vials.

But the drug company making the vaccine, CSL, says it would take too long to make enough single-dose vials.

"It would delay the role out of the vaccine by a long time," said Dr Rachel David, a spokeswoman for CSL.

"The other reason is that with pre-filled syringes you need to order a lot of syringes to roll out the vaccine for 21 million doses as the Government has ordered.

"So I think on balance the decision to use multi-dose vials is completely justified.

"Although it will work out being cheaper to use multi-dose vials, it's not being done this way to save money. It's been done this way to vaccinate a large number of people quickly, which is our best chance of stopping the flu epidemic."

'Urgency no longer there'

But Dr Gottlieb says there is no real need to rush.

He says there have been fewer deaths linked to swine flu than initially feared, and the epidemic has now subsided.

"In our society, all the members are strong advocates of vaccinations, so in no way do we want to undermine vaccination as a very effective strategy," he said.

"But in this particular influenza season we have to determine which are the risk groups that need vaccination, and the probable urgency is no longer there as it was perhaps a few months ago.

"And we would caution for a more measured approach and for single dose vaccines to be used preferably to multi-dose vials."

But that argument has done nothing to change the mind of Professor Bishop.

He is yet to sign off on the swine flu vaccine rollout, but he has indicated that when he does multi-dose vials will be used.

In a statement, Professor Bishop told ABC Radio's PM program that health workers will be trained to maximise infection control and minimise wastage.

The first jabs will go to pregnant women, health workers and people with underlying medical conditions.

THE FLU CASE

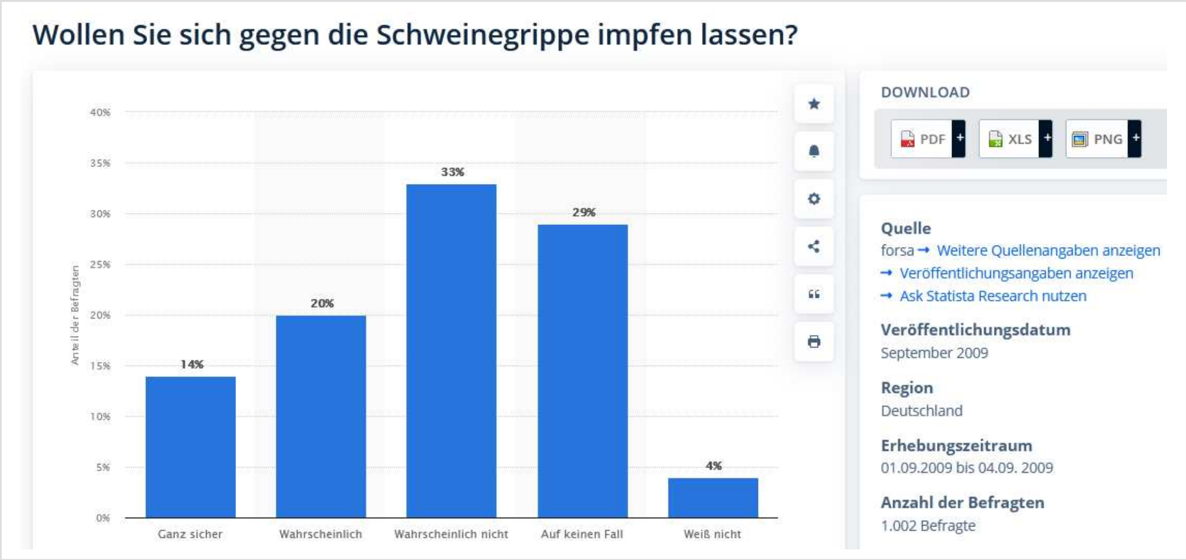
69 % of French say "Non" to the "swine flu" injection

The Flu Case, 9 September 2009
https://web.archive.org/web/20090917145338/http://www.theflucase.com/index.php?option=com_content&view=article&id=528%3A69-of-french-say-qnonq-to-the-qswine-fluq-jab&catid=41%3Ahighlighted-news&Itemid=105&lang=en

69% of the French have said they will not take the "swine flu" vaccine, according to a poll published in the French mainstream newspaper, Le Figaro.

http://www.lefigaro.fr/sante/2009/09/04/01004-20090904QCMWWW00500-avez-vous-lintention-de-vous-faire-vacciner-contre-la-grippe-a-.php

A total of 12,050 people voted in the poll which closed on Sunday.



Less than one third , 31 %, said they would take the vaccine while more than two thirds, 68.94 %, said they would not take it

"No," reads one of the comments posted underneath the poll,"because the only time I was vaccinated against the flu, I caught it. Since then I have never repeated it and I've never had the flu."

SIKA INFLUENSSA

Nur wenige Baden-Württemberger wollen Schweinegrippe-Impfung
[Only a few people in Baden-Württemberg want a Swine Flu vaccination]

Sika Influenssa, 7 September, 14:38 Uhr
https://web.archive.org/web/20090930073843/http://sikainfluenssa.biz/275/gallup-saksan-osavaltion-asukkaista-72-eivat-halua-sikainfluenssarokotetta

Stuttgart (ddp-bwb). Die Mehrheit der Baden-Württemberger lehnt eine Impfung gegen die sogenannte Schweinegrippe ab. Das geht aus einer Umfrage hervor, deren Ergebnisse die Deutsche Angestellten-Krankenkasse (DAK) am Montag in Stuttgart veröffentlichte. Befragt wurden im DAK-Auftrag vom Forsa-Institut bundesweit 1001 Erwachsene, darunter 130 im Land. 72 Prozent der Baden-Württemberger gaben an, dass sie sich «auf keinen Fall» oder «wahrscheinlich nicht» impfen lassen. Diesen Artikel weiter lesen

Nur neun Prozent der Befragten im Land wollen «ganz sicher» im Herbst an der geplanten Impfaktion teilnehmen. Auch in Bayern ist die Abneigung gegen die Impfung den Angaben zufolge hoch. Dagegen sagen in Berlin und den ostdeutschen Bundesländern laut Studie nur 44 Prozent Nein zu einer Impfung. 23 Prozent der dort Befragten antworteten, sich auf jeden Fall impfen lassen zu wollen.

Die Gefahr, an der Schweinegrippe zu erkranken, wird in Baden-Württemberg als gering eingeschätzt. Nur drei Prozent sehen eine «große Gefahr», 83 Prozent bewerteten das Risiko als «sehr niedrig» oder «eher niedrig».

Only a few people in Baden-Württemberg want a Swine Flu vaccination

3 % see big danger in the "swine flu"

Only 3 per cent of the people living in Baden Wurttemberg in Germany believe there is a big danger of becoming ill from the "swine flu", according to a poll published on Monday.

72 % said they will not take the "swine flu" jab.

A STRANGER IN GERMANY

Germans shun H1N1 vaccine

A Portrait of Germany, 9 September 2009, 3:06 pm
https://web.archive.org/web/20091023080553/http://aportraitofgermany.wordpress.com/2009/09/09/germans-shun-h1n1-vaccine/

The German government has ordered 18 million more vaccinations against swine flu. But two-thirds of Germans say they don't want to be immunized.

In the latest step to fight an anticipated breakout of the H1N1 swine flu virus, Germany's 16 state health ministers have announced they plan to order another 18 million vaccination units. That's enough to immunize nine million more people and ensures there is enough stock should demand surge later in the year.

The health ministers have already ordered 50 million swine flu vaccinations for 25 million people, as each person requires two doses of the vaccine. That means there will be enough vaccine to cover 40 percent of the German population.

The latest order is subject to funding being available. The thorny question of who will bear the cost of this – the federal government, the health insurers, the state health departments or local authorities – is being discussed at a special working group meeting in Berlin on Wednesday.

A new study conducted by the Forsa Institute for DAK, one of Germany's largest health insurers, revealed that a surprising number of Germans do not plan to get immunized.

In the study of 1,001 people aged between 18 and 60 years, 62 percent said they would "definitely not," or "almost definitely not" let themselves be vaccinated this autumn when the first swine flu vaccines become available.

Eighty-two percent of Germans said that swine flu poses a "fairly low" or "very low" danger.

Bavarians, in Germany's south, in particular rejected vaccination. Only nine percent said they would "definitely" go to their doctor to be immunized compared to 14 percent of Germans on average. It's a different picture in eastern Germany, where almost a quarter of those who took part in the study said they were "definitely" going to get immunized.

Mise à jour 28 juillet:
Un réseau de points de vente sera annoncé le 15 août. Il sera également possible dès le 3 août de faire l'achat de billets en ligne à partir de cette page en utilsant PayPal ou une carte de crédit .

Pour être informé sur l'achat de billets en ligne ou pour connaître la liste des points de vente, vous pouvez vous inscrire en envoyant un courriel à info@tele-sante.com ou appeler le (418) 380-6022

THE FLU CASE

Vital vaccination conference for Canada on September 12th

The Flu Case, 10 September 2009
https://web.archive.org/web/20090917020120/http://www.theflucase.com/index.php?option=com_content&view=article&id=548%3Avital-vaccination-conference-for-canada-on-september-12th&catid=1%3Alatest-news&Itemid=64&lang=en

A vital conference on mass vaccinations and martial law in Canada is coming up on September 12th.

You are invited to participate in this national event which brings together some of the leading health freedom advocates in Canada.

The goals of this conference are:

(1) to mobilize consumers, producers and distributors of natural health products and healthy or organic food, as well as the users and practitioners of "alternative and complimentary" therapies;

(2) to inform the population about the laws that some politicians, unelected bureaucrats and powerful lobbies are trying to pass without our knowledge and which constitute serious attacks against the Canadian Charter of Rights and Freedoms and the Canadian Constitution (such as Bill C-6 submitted by Health Canada in January 2009 which passed through 3rd reading in Parliament on June 12…); and

(3) to expose the "swine flu" pandemic scam created artificially by military and pharmaceutical organizations which control the World Health Organization (W.H.O) and whose grossly exaggerated propaganda aims at imposing mandatory vaccination in early autumn.

It is essential to intervene immediately and stop these anti-democratic initiatives and to uphold the respect of our rights and our freedom to choose how to feed and treat our body.

The "Foundation for Freedom of Choice in Health" which will be officially launched at this occasion will offer a legal and political structure to its members ensuring the protection of fundamental and inalienable human rights. We are counting on your participation, since everyone is concerned.

Thank you from the team!

F. William Engdahl

Nano Particles used in Untested H1N1 Swine Flu Vaccines
Part III: ‘It’s the vaccines, Stupid!

Global Research, 13 September 2009
https://web.archive.org/web/20100103021737/http://www.globalresearch.ca/index.php?aid=15092&context=va

Vaccines which have been approved by the responsible government authorities for vaccination against the alleged H1N1 Influenza A Swine Flu have been found to contain nano particles. Vaccine makers have been experimenting with nanoparticles as a way to "turbo charge” vaccines for several years. Now it has come out that the vaccines approved for use in Germany and other European countries contain nanoparticles in a form that reportedly attacks healthy cells and can be deadly.

In 2007 researchers at the Ecole Polytechnique Fédérale de Lausanne (EPFL) announced in an article in the journal, *Nature Biotechnology*, that they had developed a "nanoparticle that can deliver vaccines more effectively, with fewer side effects, and at a fraction of the cost of current vaccine technologies.” The article went on to describe the effects of their breakthrough: "At a mere 25 nanometers, these particles are so tiny that once injected, they flow through the skin’s extracellular matrix, making a beeline to the lymph nodes. Within minutes, they’ve reached a concentration of DCs thousands of times greater than in the skin. The immune response can then be extremely strong and effective.” [1]

There is only one small problem with vaccines containing nanoparticles – they can be deadly and at the least cause severe irreparable health damage.

Nanoparticles, promoted in the mass media as the new wonder revolution of science, are particles that have been produced vastly smaller than deadly asbestos particles which caused severe lung damage and death before being outlawed. Particles at a nano size, (nm = 0,000000001 Meter) fuse together with the membranes of our body cell membranes and, according to recent studies in China and Japan, continuously destroy cells once introduced into the body. Once they interact with the body’s cellular structure, they cannot be removed. Modern medicine euphemistically terms the phenomenon, a continuing infectious reaction.

Since the asbestos scandal, it has been established that particles in size a millionth of a meter, because of their enormous attractive force, penetrate all cells, destroying all those they come into contact with. Nanoparticles are far smaller than asbestos fibers.

Beijing Tests confirm deadly effects on humans

The fact that WHO, the European Medicines Evaluation Agency, the German Robert Koch Institute and other health bodies today would permit the population to be injected with largely untested novel vaccines containing nanoparticles says more about the powerful pharma lobby in Euiropean politics than it does about the sanity or moral integrity of the civil servants responsible for health of the general public.

The September 2009 issue of the respected *European Respiratory Journal*, made public on 19 August, and available since 21 August online, contains a peer-reviewed article with the title, "*Exposure to nanoparticles is related to pleural effusion, pulmonary fibrosis and granuloma*.”

The article describes tests carried out in 2008 at the elite Beijing Chaoyang Hospital on seven young women. All seven, ages 18-47 had been exposed to nanoparticles for 5–13 months in their common workplace. All were admitted to the hospital with shortness of breath and pleural effusions, or excessive fluids surrounding the lungs, inhibiting breathing. None of the seven had ever smoked and none were in any special risk group. Doctors carefully tested for every possibility and confirmed that the lung problems had a common origin – regular inhalation of nanoparticles in their factory. They had been exposed to Polyacrylat nanoparticles.

The tests confirmed the nanoparticles had set off a "super-meltdown" reaction in the patients. Despite all heroic efforts of doctors, two of the seven died from the lung complications.[2]

In their report, the scientists concluded something so alarming it is necessary to quote at length:
"Immunological tests, examinations of bacteriology, virology and tumour markers, bronchoscopy, internal thoracoscopy and video-assisted thoracic surgery were performed. Surveys of the workplace, clinical observations and examinations of the patients were conducted. Polyacrylate, consisting of nanoparticles, was confirmed in the workplace. Pathological examinations of patients' lung tissue displayed nonspecific pulmonary inflammation, pulmonary fibrosis and foreign-body granulomas of pleura. Using transmission electron microscopy, nanoparticles were observed to lodge in the cytoplasm and caryoplasm of pulmonary epithelial and mesothelial cells, but are also located in the chest fluid. These cases arouse concern that long-term exposure to some nanoparticles without protective measures may be related to serious damage to human lungs".[3]

To date Animal studies and in vitro experiments show that nanoparticles can result in lung damage and other toxicity in animals, but no reports on the clinical toxicity in humans due to nanoparticles prior to the Beijing study had been made.

The Beijing Chaoyang Hospital study has now conclusively confirmed that nanoparticles cause lung damage and other toxicity in humans as well. At this point in time, when two of the approved vaccines planned to be mass distributed in Germany and elsewhere contain nanoparticles, failure of the relevant responsible public health and epidemiology officials to order an immediate emergency freeze on distribution of any vaccine containing nanoparticles can only be considered tantamount to criminal negligence. Hopefully the responsible authorities will react in time to avert a possible human health catastrophe orders of magnitude worse than the worst case of Swine Flu reported to date.

Sikainfluenssarokote ei innosta piikitettäväksi
[The swine flu vaccine doesn't inspire people to be tickled]

MTV3, 18 September 2009, 13:35
https://web.archive.org/web/20090923015418/http://www.mtv3.fi/uutiset/kotimaa.shtml/arkistot/kotimaa/2009/09/956990

Sikainfluenssarokote ei näytä vetoavan suomalaisiin. MTV:n nettikyselyn mukaan yli 61 prosenttia vastanneista ei halua ottaa rokotetta. Moni vastaajista on sitä mieltä, että sikainfluenssa ei poikkea muista flunssista.

- Se on flunssa toisten joukossa, mediassa luodaan turhaa dramatiikkaa asian ympärille, kirjoittaa nimimerkki *Flunssa tai ei*.

- En usko, että pienestä lenssusta on minulle mitään haittaa vaikka sen saisinkin. Jos minulla olisi lapsia niin niille varmaan hankkisin, sanoo *Miu*.

- En halua rokotetta siksi, että olen sairastanut mm. honkongilaisen 70-luvun vaihteessa ja selvisin siitäkin hengissä. Näitä infulenssoja on ollut maailman halki ja tulee olemaan. Lääkefirmat rahastaa ja osakkeen omistajat rikastuu, kirjoittaa *Fripe*.

Useat eivät myöskään usko rokotteen tehoon, tai sen sivuvaikutukset huolettavat.

- En oikein luota nopeasti kehitettyyn rokotteeseen. Sikainfluenssaa pidän lähes tavallisen flunssan veroisena tautina. Tällä hetkellä, kirjoittaa *L.T*.

- En luota rokotteiden, varsinkaan näin uusien, turvallisuuteen. Rokotteissa on paljon myrkyllisiä aineita, joten miksi niitä pitää tunkea ihmiskehoon, pohtii nimimerkki *Ei täyttä suojaa*.

- Ei ole vielä kunnon tutkimuksia. Olkoon ensimmäinen rokotettavien aalto koekaniineina. Itse en halua, liian isot riskit, toteaa *PH*.

Yli 1400 vastaajasta reilut 38 prosenttia on valmis ottamaan rokotteen. Monella perusteluna on riskiryhmään kuuluminen.

- Tottakai, koska kuulun saada, riskiryhmän takia ja muutoinkin sen haluaisin, kirjoittaa nimimerkki *Jep,jep*.

- Kuulun ikäryhmään yli 65 vuotiaat ja olen viime vuosina ottanut säännöllisesti rokotukset. Epäilen oman vastustuskykyni heikenneen sen johdosta. Inhottavaa olla sairas, toteaa *Ikäihminen*.

- Olen ns. riskiryhmää, diabetes, sydäntauti ym. Sairaus merkitsisi minulle kovempaa taudinkuvaa, kuin täysin terveelle, kertoo *Johanna*.

Moni rokotteen ottavista ajattelee myös kanssaihmisiä.

- Kyllä ihan sen takia, että en halua sairastua ja tartuttaa pieniä lapsenlapsiani joita usein hoitelen, sanoo *Santtu*.

- Ei tautien sairastaminen ole mikään itsetarkoitus. Vaikka tauti olisi vaaraton saattaa saada jälkitaudin joka on huomattavasti pahempi ja lisäksi voi toimia välikappaleena tartuttaen taudin riskiryhmään kuuluvalle joka saattaa menehtyä siihen. Siis koittakaa nyt ääliöt tajuta, että ette ole maailmassa yksin, jyrähtää *Make 56*.

Ten Swine Flu Lies Told by the Mainstream Media

Natural News, 18 September 2009
https://web.archive.org/web/20101005022331/http://www.naturalnews.com/027055_swine_flu_vaccines_swine_flu_vaccine.html

The mainstream media is engaged in what we Americans call "bald faced lies" about swine flu. It seems to be true with this issue more than any other, and it became apparent to me recently when a colleague of mine – a nationally-syndicated newspaper columnist – told me their column on natural defenses for swine flu was rejected by newspapers all across the country. Many newspapers refused to run the column and, instead, ran an ad for "free vaccine clinics" in the same space.

The media, it seems, is so deeply in bed with the culture of vaccinations that they will do almost anything to keep the public misinformed. And that includes lying about swine flu vaccines.

There are ten key lies that continue to be told by the mainstream media (MSM) about swine flu and swine flu vaccines.

Lie #1 - There are no adjuvants used in the vaccines

I was recently being interviewed by a major U.S. news network when the reporter interviewing me came up with this humdinger: There are *no adjuvants* being used in the swine flu vaccines, he said!

I assured him that adjuvants were, indeed, a crucial part of the vaccine recipe, and they were being widely used by drug companies to "stretch" the vaccine supply. It's no secret. But he insisted he had been directly told by a drug company rep that no adjuvants were being used at all. And he believed them! So everything being published by this large news network about swine flu vaccines now assumes there are no adjuvants in the vaccines at all.

Lie #2 - The swine flu is more dangerous than seasonal flu

This lie is finally starting to unravel. I admit that in the early days of this pandemic, even I was concerned this could be a global killer. But after observing the very mild impact the virus was having on people in the real world, it became obvious that this was a mild flu, no more dangerous than a seasonal flu.

The MSM, however, continues to promote H1N1 swine flu as being super dangerous, driving fear into the minds of people and encouraging them to rush out and get a vaccine shot for a flu that's really no more likely to kill them than the regular winter sniffles. Sure, the virus could still mutate into something far worse, but if it does that, the current vaccine could be rendered obsolete anyway!

Lie #3 - Vaccines protect you from swine flu

This is the biggest lie of all, and the media pushes it hard. Getting a vaccine, they insist, will protect you from the swine flu. But it's just flat-out false. Even if the vaccine produces antibodies, that's not the same thing as real-world immunity from a live virus, especially if the virus mutates (as they often do).

As I pointed out in a recent article, statistically speaking the average American is *40 times more likely to be struck by lightning* than to have their life saved by a swine flu vaccine.
https://web.archive.org/web/20100926165527/http://www.naturalnews.com/026955_swine_flu_vaccines_flu_vaccines.html

Lie #4 - Vaccines are safe

And how would any journalists actually know this? None of the vaccines have been subjected to real-world testing for any meaningful duration. The "safety" of these vaccines is nothing more than wishful thinking.

The MSM also doesn't want you to know what's in the vaccines. Some vaccines are made from viral fragments grown in diseased African monkeys. If that sounds incredible, read the true story here:

http://thrakinews.blogspot.com/2009/09/blog-post_754.html

ΟΡΓΙΑΣΤΙΚΟ ΚΑΙ ΑΝΗΣΥΧΗΤΙΚΟ ΠΑΡΑΣΚΗΝΙΟ ΠΙΣΩ ΑΠΟ ΤΗ ΓΡΙΠΗ H1N1

-Αρνούνται να εμβολιαστούν πολίτες που αμφισβητούν τη χρησιμότητα
- Ξεκίνησε δικαστικός αγώνας με αγωγές

«Είμαστε απλοί Έλληνες πολίτες που δεν ανήκουμε σε καμία παράταξη ή οργανισμό. Δεν αποσκοπούμε σε κανένα όφελος, κοινωνικό, οικονομικό ή άλλο. Το μόνο που επιζητούμε είναι η κινητοποίηση της ελληνικής κοινωνίας απέναντι σε ένα κρίσιμο θέμα για την υγεία του ελληνικού πληθυσμού - και όχι μόνο: Αρνούμαστε να εμβολιαστούμε για τον ιό H1N1».

Αυτά διαβάζει κάποιος στην κίνηση των αρνούμενων να εμβολιαστούν (υπάρχει ήδη παγκόσμιο κίνημα), η οποία ήδη στη χώρα μας αριθμεί 4.064 μέλη μέσω του facebook μόνο. (www.facebook.com/home.php?#/group.php?gid=109274477004 - *deleted*).

Μεγάλη και διαρκώς ογκούμενη φιλολογία αναπτύσσεται γύρω από το «ζήτημα της χρονιάς» όπως χαρακτηρίζεται η γρίπη H1N1. Με άξονα όσα λέγονται και γράφονται για το «γεγονός της χρονιάς», καθώς και μια ενδιαφέρουσα έρευνα της Θεσσαλονικιάς Βίκυς Χρυσού που δημοσιεύεται στο περιοδικό «Άβατον», η «Θ» ανοίγει τον φάκελο του ζητήματος.

Οι κύριες αντιδράσεις εστιάζουν στην πραγματική έκταση του θέματος και στη χρηστικότητα του εμβολίου, κάνοντας λόγο για μια ακολουθούμενη «καλοστημένη ροή "πληροφοριών" που σπέρνει σταγόνα-σταγόνα το φόβο μετάδοσης της ασθένειας και στρώνει το δρόμο αποδοχής των "προληπτικών" εμβολιασμών των πληθυσμών, με στόχο τη χειραγώγηση αλλά και το κέρδος για τα φαρμακευτικά καρτέλ». Μέσα απ' όλα αυτά, μαθαίνουμε ότι ο επί κυβέρνησης Bush υπουργός άμυνας των ΗΠΑ, Donald Rumsfeld, ως βασικός μέτοχος της εταιρείες βιοτεχνολογίας Gilead, κατέχει τα εμπορικά δικαιώματα του αμφιλεγόμενου και επικίνδυνου –όπως αποδείχτηκε αργότερα – εμβολίου «Tamiflu-Roche».

Το εμβόλιο αυτό μονοπώλησε την αγορά κατά τη «γρίπη των πτηνών» και απέφερε δισεκατομμύρια δολάρια στους γνωστούς κι άγνωστους μετόχους της εταιρείας που το παρήγαγε. Ήδη το «Tamiflu» έχει απαγορευτεί για τα παιδιά στην Ιαπωνία, αφού προκάλεσε δεκατέσσερις θανάτους και ανήκεστες βλάβες σ' αυτά.

Παράλληλα, αναπτύσσεται όλο και περισσότερο η φιλολογία περί τεχνητού δημιουργήματος που ξέφυγε από κάποιο εργαστήριο βιοτεχνολογίας, όπως είχε γίνει και στη δεκαετία του '80 με τον ιό του AIDS. Επιστήμονες τονίζουν ότι σε καμία περίπτωση δεν θα μπορούσε να προκύψει με φυσικές διεργασίες μετάλλαξη του ιού, που να περιέχει γονίδια χοίρων, πτηνών και ανθρώπων ταυτόχρονα, σε μια χώρα όπως το Μεξικό, όπου αυτά τα είδη δε ζουν μαζί και δεν υπάρχουν εκτεταμένες εγκαταστάσεις ορνιθοτροφείων.

Τον περασμένο Φεβρουάριο πέρασε σχεδόν απαρατήρητη η είδηση ενός ατυχήματος με τρένο στην Αυστρία, το οποίο μετέφερε δοχείο με δείγμα επικίνδυνων ιών H1N1, για λογαριασμό της φαρμακευτικής εταιρείας «Baxter». Αποστολέας του υλικού ήταν ο Παγκόσμιος Οργανισμός

Υγείας που διατηρεί «τράπεζα ιών», ενώ η «Baxter» έχει πατέντα του ιού από πέρυσι!... Στην υπόθεση ενεπλάκησαν τα ονόματα των «Novartis», «Glaxo» και «Sanofi», εταιριών που σύμφωνα με δήλωση του ελληνικού υπουργείου Υγείας θα προμηθεύσουν την Ελλάδα με εμβόλια. Σύμφωνα με ιατρικά δεδομένα, οι πολίτες που θα εμβολιάζονται θα αποτελούν φορείς και ισχυρούς μεταδότες του ιού στις κοινότητές τους, μετατρέποντας ακόμη και τις σχετικά ακίνδυνες μορφές φθινοπωρινής γρίπης, σε γρίπη βαριάς μορφής. Με το μαζικό εμβολιασμό και έχοντας ο ιός τέτοια μεταδοτικότητα, αναμένεται μια πραγματική πανδημία ανάλογη με εκείνη της «ισπανικής γρίπης» του 1918, που κόστισε τη ζωή σε είκοσι εκατομμύρια ανθρώπους σε Ευρώπη και Αμερική. Αξίζει να σημειωθεί πως η Ελλάδα δεν θρήνησε θύματα τότε επειδή ακριβώς δεν είχε εμβολιαστεί ο πληθυσμός, γεγονός που τονίζεται έντονα στο εξωτερικό.

ΟΙ ΜΕΘΟΔΕΥΣΕΙΣ ΚΑΙ ΟΙ ΔΗΛΩΣΕΙΣ ΜΟΥΤΣΟΠΟΥΛΟΥ

Σήμερα η χώρα μας ως μέλος του ΟΗΕ και του ΠΟΥ, δηλώνει έτοιμη ν' ακολουθήσει τη γραμμή των μαζικών εμβολιασμών. Μπορεί οι εν λόγω σχηματισμοί να θεωρούνται ιδρύματα στην υπηρεσία της ανθρωπότητας, όμως εκατοντάδες ανεξάρτητες έρευνες έχουν εντοπίσει μυριάδες ατοπήματα, εμπλοκές τους σε σκάνδαλα και απάνθρωπες πρακτικές. Μεταξύ άλλων, και η ανοχή τους απέναντι στις συγκαλυμμένες δοκιμές φαρμάκων και εμβολίων σε παιδιά της Αφρικής. Ας μην ξεχνάμε τον Fritz ter Meer που καταδικάστηκε στη Νυρεμβέργη για διενέργεια πειραμάτων σε κρατούμενους στο Auschwitz. Μόλις αποφυλακίστηκε μετά από μόλις επτά χρόνια (1956), έγινε πρόεδρος της «Bayer»!... Και ας μην ξεχνάμε ότι οι έρευνες -που πληρώνονται από το δημόσιο, δηλαδή από τους πολίτες- γίνονται αντικείμενα σφετερισμού από τις φαρμακοβιομηχανίες που απολαμβάνουν σημαντικές φοροαπαλλαγές, με κορωνίδα στο ζήτημα τις ΗΠΑ.

Οι «υπόγειες» νομοθετικές ρυθμίσεις που προηγήθηκαν στις ΗΠΑ δεν επιτρέπουν στους πολίτες να αρνηθούν τον εμβολιασμό τους. Τυχόν άρνηση ισοδυναμεί με ποινικό αδίκημα και τιμωρείται με βίαιη απομάκρυνση και εγκλεισμό στα ειδικά στρατόπεδα συγκέντρωσης της FEMA! Λίγο πριν τα Χριστούγεννα, όταν ακόμη δε γινόταν καν λόγος για γρίπη, ο George Bush είχε περάσει νομοσχέδιο που δίνει ασυλία στις φαρμακευτικές εταιρείες και τις απαλλάσσει από κάθε ευθύνη για την ασφάλεια ή τις παρενέργειες των σκευασμάτων που θα χορηγούν σε καιρό «ειδικής ανάγκης σε θέματα υγείας». Προφανώς, οι νομοθετικές ρυθμίσεις της υπερδύναμης «δείχνουν» την κατεύθυνση που πρέπει να ακολουθήσουν και οι κυβερνήσεις των άλλων χωρών, όπως έγινε για παράδειγμα με την ασφάλεια των αεροδρομίων μετά την 11η Σεπτεμβρίου.

Σε όλο τον κόσμο σήμερα, πλήθος άρθρων συνδέει τη νέα γρίπη και τα εμβόλια με τον όρο «βιολογικά όπλα». Ας μην ξεχνάμε ότι η επιστημονική αλαζονεία δεν έχει πάψει να στοιχειώνει τη ζωή, καθώς σπαταλά δισεκατομμύρια για φονικές εφευρέσεις και όχι κινούμενη πάντα με γνώμονα το κοινωνικό όφελος… Ένας από τους λίγους γιατρούς που εκφράζουν ανοιχτά την αντίθεσή τους στο στημένο σκηνικό τρόμου της νέας γρίπης, είναι ο ανοσολόγος-παθολόγος και καθηγητής της Ιατρικής Σχολής του Πανεπιστημίου Αθηνών κ. Χαράλαμπος Μουτσόπουλος. Σε συνέντευξή του στο «Βήμα» (26.7.2009) τονίζει πολλά και ενδιαφέροντα όπως «δεν υπάρχει επιστημονικό ή επιδημιολογικό δεδομένο που να στηρίζει αυτή τη μεγάλη ανησυχία για τη νέα γρίπη», «στη δημιουργία σεναρίων σημαντικό ρόλο παίζουν η φαρμακευτική βιομηχανία, η εξεύρεση πόρων για μελέτες και έρευνες, τα παιχνίδια εξουσίας και η αύξηση της επιστημονικής φήμης ερευνητών που ασχολούνται με τους ιούς της γρίπης» και «είναι ένας ακόμη τρόπος να τρομοκρατήσουμε τους συμπατριώτες μας, να τους απομακρύνουμε από τα υπαρκτά προβλήματα της χώρας και να επιδεινώσουμε την ήδη κακή πορεία της οικονομίας μας».

ΣΗΜΕΙΑ ΑΞΙΑ ΠΡΟΣΟΧΗΣ

Κρατούμε τη δήλωση «το μόνο ασφαλές εμβόλιο είναι αυτό που δεν χρησιμοποιείται ποτέ» του James Shannon, τέως διευθυντή του αμερικανικού εθνικού συμβουλίου υγείας και καταγράφουμε μερικά ενδιαφέροντα σημεία επί του θέματος:

-Τα εμβόλια είναι αναποτελεσματικά, κάτι που παραδέχεται τηλεφωνικά ακόμη και ο παρασκευαστής (http://www.youtube.com/watch?v=az5aAwr4ugE).

-Δεν υπάρχει οργανισμός που να ελέγχει τι περιέχεται στα εμβόλια.

-Από τους 145 πρώτους θανάτους οι 128 καταγράφηκαν στο Μεξικό όπου είχε προηγηθεί δωρεάν εμβολιασμός του πληθυσμού.

-Το πολυδιαφημιζόμενο Tamiflu έχει από το 2007 απαγορευτεί στην Ιαπωνία για παιδιά γιατί προκάλεσε (14) θανάτους και ανήκεστες βλάβες ενώ η προβλεπόμενη από την εταιρία επωφελής δράση του είναι συντόμευση μόνον της ανάρρωσης κατά μία ή μιάμιση ημέρα εδώ.

-Αποτελεσματική για την αντιμετώπιση της γρίπης είναι η επαρκής ποσότητα βιταμίνης D η οποία ενεργοποιείται με έκθεση στον ήλιο (η έξαρση το χειμώνα οφείλεται στην έλλειψη της βιταμίνης αυτής λόγω ανεπαρκούς έκθεσης στον ήλιο).

Τέλος, παραθέτουμε έναν ενδεικτικό πίνακα σύγκρισης κόστους συστατικών και τελικής τιμής φαρμάκων ευρείας κυκλοφορίας (σε δολάρια):

-Xanax 1 mg. Τιμή (100 tablets): 136,79. Κόστος συστατικών: 0,024. Ποσοστό υπερτίμησης 569.958%.
-Prozac 20 mg Τιμή (100 tablets): 247,47. Κόστος συστατικών: 0,11. Ποσοστό υπερτίμησης: 224.973%.
-Norvasec 10 mg. Τιμή (100 tablets): 188,29 Κόστος συστατικών: 0,14. Ποσοστό υπερτίμησης: 134,493%.
-Tenormin 50 mg. Τιμή (100 tablets): 104,47. Κόστος συστατικών: 0,13. Ποσοστό υπερτίμησης: 80.362%.

ΓΙΓΑΝΤΩΝΕΤΑΙ Η ΑΝΤΙΣΤΑΣΗ ΤΩΝ ΠΟΛΙΤΩΝ

Απέναντι σ' αυτή τη ζοφερή κατάσταση, αναπτύσσονται σήμερα συνεχώς δίκτυα αντίστασης πολιτών που εξελίσσονται σε μια παγκόσμια ανεξάρτητη φωνή ενημέρωσης, παρακινώντας τους πολίτες να αρνηθούν τον εμβολιασμό τους. Αγωγές ασκήθηκαν ήδη ατομικά ή μαζικά στη Γαλλία και στις ΗΠΑ, ενώ νέες αγωγές προστίθενται ενάντια στην αυστριακή υπουργό Υγείας, σε άτομα και φορείς για τη δράση τους στο ζήτημα της γρίπης και τις διασυνδέσεις τους με την «Baxter».

Οι «Glaxo» και «Novartis» αναζητούν εθελοντές –και μικρά παιδιά– για τις δοκιμές των σκευασμάτων τους, που σύμφωνα με δήλωση του ιολόγου Alexander Kekuli του Halle – Wittenberg University, μπορούν να αποβούν ιδιαίτερα επικίνδυνες στα παιδιά. Η Νέα Ζηλανδία δήλωσε πως θα αρνηθεί να γίνουν δοκιμές στη χώρα της, ενώ η Τσεχία –όπου έχουν ήδη συλληφθεί γιατροί και νοσοκόμες που προκάλεσαν το θάνατο αστέγων, στους οποίους δοκιμάστηκαν τα εν λόγω εμβόλια– αρνείται να εμβολιάσει έστω κι ένα άτομο στη χώρα! Κάτι που δηλώνεται και από την Πολωνία, για την οποία γράφεται ότι έχει «παραγκωνίσει» επί του θέματος τον αμερικανό πρέσβη, αρνούμενη να δώσει στον ΠΟΥ τον έλεγχο επί της πανδημίας στη χώρα. Ο δε υπουργός Υγείας της Νέας Ζηλανδίας, δήλωσε πως δεν πρόκειται να γίνουν εκεί δοκιμές σε ανθρώπους και δεν θα χρησιμοποιηθούν οποιαδήποτε αδοκίμαστα εμβόλια σε κανέναν πολίτη της χώρας.

Και έπεται μακρά συνέχεια…

Aiming Towards Better Health

Vaccines are one Big Experiment causing Hundreds of Diseases in the Modern World

Prevent Disease, 21 September 2009
https://web.archive.org/web/20100101232103/http://preventdisease.com/news/09/092109_vaccines_responsible_for_all_diseases.shtml

How is it that the mainstream media and international governments continue to ignore decades of evidence on the deadly effects of vaccines? It seems almost inconceivable that the issue is still under debate. This perpetual fraud of disease prevention is causing hundreds of diseases which further pharmaceutical agendas. It is time to face the facts, stand up for humanity and boycott all vaccines worldwide today!

How much longer will people shrug off serious warnings from vaccine researchers, neuroscientists and medical specialists around the world? It is now proven that we are all being harmed by vaccination programs. The entire vaccine industry, as it turns out, has been one big experiment. There is NOT ONE long-term scientific study to validate the safety or effectiveness of vaccines in humans. There are absolutely NO "within subject design studies" that justify the immunization positions of national and international public health agencies.

It seems that this is not a concern for the medical community. They simply carry on with their poisonous injections without any regard for human health, especially children. For an industry that prides itself on scientific observations, their ignorance is not only irresponsible, it's criminal.

Science is only a man made truth-seeking tool. It is fallible. It is a statistical, probabilistic mathematical model. It has limitations. Wielded for profit - truth can become lost.

Scientific methods, design, and analyses can just as soon hide the truth as they can discover truth, or create 'truth" de-novo.

Science cannot replace the tools of common sense and observation we all have. You do not need statistical probabilistic mathematical models, wielded by experts, to deny what you can see with your very own eyes. We can observe scientific conclusions, but we must realize that empirical observations can effectively expose the reality of vaccines.

The truth is frightening, disheartening, alarming, and now self-evident.

ALL vaccines are causing immediate and delayed, acute and chronic, increasing and decreasing, impairments to blood flow, throughout the brain and body. This IS causing us all to become chronically ill, sick, and brain damaged along a continuum of other symptoms, some of which are clinically silent until death. Vaccines are causing ischemic "strokes". Since the damages are microscopic, we cannot see them as they occur. However, we can now see the neurological aftermath of these damages - within hours and days of **vaccination** - all vaccinations.

There is a direct and statistical correlation between the diseases that affect a given population (in developed nations) and the frequency of vaccines administered. That being said, there is an excellent probability that hundreds of diseases in the modern world are simply a by-product of the harmful effects of vaccines.

SIKA INFLUENSSA

Journal télévisé RTBF de mardi 22 septembre

Sika Influenca, 22 September 2009
https://web.archive.org/web/20090930043055/http://sikainfluenssa.biz/442/belgia-poikkeustilassa-heinakuuhun-asti-sikainfluenssan-takia

Introduction par le journaliste François de Brigode: «Le gouvernement fédéral a demandé des pouvoirs spéciaux dans le cadre de la pandémie grippe A, des «supers pouvoirs » en quelque sorte, qui permettront au gouvernement d'agir vite sans passer par le contrôle du parlement. La commission Santé Publique à la chambre a voté ces pouvoirs spéciaux».

Journaliste Baudouin Remy: «Avec 6.000 cas chez nous on est loin du plan scénario catastrophe de la grippe A / H1N1. Et pourtant le gouvernement obtiendra des pouvoirs spéciaux. N'est-ce pas disproportionné?».

Onkelinx: «Disons que c'est un mal nécessaire. Je n'aime pas du tout mais c'est indispensable. Je le dis et je le répète: on ne fait rien! On se donne la possibilité de faire».

Journaliste: «Bref on se prépare… mais à quoi?».

Onkelinx: «Nous devons gérer éventuellement une épidémie fulgurante en Belgique en ne sachant pas, en plus, si le virus va muter ou pas. Certains disent que «non» et d'autres «peut-être bien».

Journaliste: «Les pouvoirs spéciaux permettront de réquisitionner des professionnels pour la vaccination et d'organiser la distribution des médicaments, bref de réagir vite si le virus mute. Et le vaccin, justement, près de 13 millions de doses ont déjà été commandés».

Jean-Jacques Flahaut (MR): «Vaccin: pas encore obligatoire à ce stade, la ministre vient de le dire, il y a 30 secondes au sein de la commission, mais évidemment ça sera en fonction de l'évolution des choses cela pourrait aller vers… heu… heu… une incitation plus forte».

Catherine Fonck: «On ne peut jamais déterminer à 100% qu'il n'y aura pas d'effets secondaires de complications dû au vaccin. Et donc je crois vraiment qu'il faut une information éclairée, complète sur les risques».

Journaliste: «Certains mettent la dangerosité et l'efficacité de ce vaccin en cause».

SIKA INFLUENSSA

Belgians protest "dictatorship” established under Pandemic pretext

Sika Influenca, 22 September 2009
https://web.archive.org/web/20090930043055/http://sikainfluenssa.biz/442/belgia-poikkeustilassa-heinakuuhun-asti-sikainfluenssan-takia

The Belgian newspaper "Le Soir” has attacked the decision by the Belgian government to give sweeping "special powers” to a crisis committee established to oversee the "pandemic emergency” for six months or until July 2010 at the latest.

The special powers allow a small group of ministers and the King of Belgium to bypass parliament and enact any law that they consider "necessary” to deal with the pandemic **emergency**, such as compelling nurses and police to carry out forced vaccinations.

A comment from Le Soir newspaper appeared today, 24 September 2009, on page 3 under the pen name of Ricardo Gutièrrez, saying that the Belgian people were far more concerned by the arsenal of "special powers” that the federal government was deploying than by the "pandemic” itself.

It is stated that French health professionals last Wednesday demanded "scientific proof” that the "swine flu” vaccine is necessary and not dangerous, especially to pregnant women and young children.

Georges-Henri Beauthier, a lawyer acting on behalf of concerned citizen groups, is preparing to send a nine page letter to all the members of the federal parliament informing them of the risks associated with the vaccine, especially with adjuvants.

Beauthier said that politicians were reacting to a very "theoretical” risk by passing measures detrimental to civic rights.

In another interview in Le Soir, the lawyers Ines Wouters, an expert in human rights, and Philippe Vanlangendonck, an expert in medical law, said there is no justification for the suspension of Parliament in Belgium under the pretext of a pandemic emergency.

"We can see no reason in the actual circumstances today to turn Belgium virtually into a kind of dictatorship,” Wouters said.

Vanlangendonck said that there was no reason to transfer powers from parliament to an executive when all institutions were functioning, and when parliament had just been recalled, medical professionals were working efficiently and the economy had not been noticeably affected by the pandemic.

Wouters said that the government was trying to give a legal basis to illegal decisions to distribute anti viral medicines in April that have not been properly licensed.

In a hard hitting interview on Belgian TV on Tuesday with the the Belgian Health Minister Laurette Onkelinx, a Belgian reporter called the decision by the public health committee to give "super powers” to an executive and suspend parliament to deal with a pandemic was "disproportionate” in view of the fact that there were only 6,000 cases of mild swine flu in the country so far and no sign of a catasrophe.

Onkelinx replied that it was a "necessary evil.”

"I don’t like [imposing mlitary rule] at all,” she said. "But it’s indispensable.”

She also said people who claimed the "swine flu” vaccine was dangerous were "crazy” , arguing it would only be given if approved by the European Medicines Agency – but as the agency itself states in its own documents, the safety of the vaccine will not be proven before it is given to people in the biggest "experiment” in history.

Mike Adams

Swine flu vaccine recipients could be tracked with RFID bracelets using Big Brother medical technology

Natural News, 24 September 2009
https://www.naturalnews.com/027093_vaccine_rfid_flu.html

Here's the scene from some dark, present-day action movie: David Balfour breathed hard. He could hear the thumping of heavy boots outside his door, down the hall, mixed with the muffled grunts of military men. He had known they would come. It was obvious from the moment he refused the VaxTrax bracelet at the county clinic. They said it would keep him safe because they could pinpoint his location if he ever suffered a heart attack or an accident. As a bonus, his entire medical history was also imprinted in the RFID chip, so even if he was found unconscious, they could determine his medical status and start treatment right away.

But he had refused on the spot. David didn't want to be tracked. So he walked away from the clinic, without the vaccine and without the bracelet.

That was stupid, he now realized. They had apparently tracked him anyway... somehow... and now they were at his door, and their fists pounded loudly.

"Boston Police! Open up!"

He glanced at the window behind him. Too late to plan an escape route. Maybe he should have thought of that earlier, but no, fleeing out the window was the stuff of Hollywood fiction, not here-and-now reality in Boston, Massachusetts.

"Mr. Balfour!" the police shouted. "You have ten seconds to open this door, or we are coming in."

They weren't bluffing. Pretending he wasn't home clearly wouldn't work. Maybe he could talk his way out of it. "I've broken no law!" he screamed back at the door.

"Mr. Balfour," came the voice in authoritative tones, "You have refused to wear the VaxTrax bracelet as mandated by the National Pandemic Protection Act, and as we cannot determine your vaccination status, you are considered a danger to the people of this city."

"You have five seconds."

There was no way to fight this, he realized. So David stood, reached out to the door and began to slide the locking mechanism open...

BAM! The door burst open, striking David across the chest and forehead, flinging him backwards, stumbling, then collapsing with a gasp onto the living room floor. A mass of armored military men swarmed into the room, grabbed his wrists and forced his hands behind his back to be painfully handcuffed. He tried to scream but discovered himself too disoriented to find his voice. All he could do was hurt.

The scramble was over in seconds. He found himself face down, nose buried into the patterns of his living room rug, half conscious, with a hard knee pressed sharply into his kidney. There was a pause.

Then he heard footsteps... not those of military boots, but the soft shuffling of worn walking shoes. This was someone different, someone more... civilian.

"I'm doctor Argosy," a voice hummed above and behind him. "Mr. Balfour, you are now going to receive an FDA-approved H1N1 vaccination and be fitted with a VaxTrax bracelet. Please remain calm."

So this is what it has come to, he thought. Face down on the floor of his own home, a squad of vaccine enforcers standing on his back, a pair of handcuffs, a shattered front door, a probable black eye and a doctor, hidden from view, about to inject him with something he knew couldn't possibly be safe.

The vaccine shot itself was painless and quick. Maybe it was the adrenaline, he thought, that masked the pain. He felt the cold plastic of a tracking bracelet being zipped around his wrist, then the handcuffs slid away and the pressure in his back released. "There, Mr. Balfour. You're all set," said the voice of the doctor. "Have a nice day."

Before leaving, one of the police officers leaned close to him, almost whispering in his ear, "And don't try to take off your VaxTrax, or we'll know, and we'll have to come back here."

They marched out almost as quickly as they had entered, stomping down the hall for a few moments, and then the sounds paused. A pounding on another door broke the silence. David heard them shouting through the door of his neighbor's apartment. "Mrs. Henderson, open up. This is the Boston Police!"...

This may not be fiction for very long

The above fictional account may not remain fiction for long. Late last year, the city of Boston began fitting vaccine recipients with RFID tracking bracelets, allowing health authorities to visually track the vaccine status of city residents on a large digital map. This map shows the location and status of anyone wearing an RFID tracking bracelet, thereby revealing areas of the city where vaccination rates are low, too.

By identifying these "low vaccination" areas, city officials could roll in with mobile vaccination units and law enforcement personnel, then march door to door, vaccinating and tagging residents either voluntarily or at gunpoint, depending on the circumstances. It's all perfectly legal, by the way, under Massachusetts laws that are being put in place right now to handle the expected swine flu pandemic.

This RFID vaccine tracking technology isn't fiction. It exists right now and was reported by the *Boston Globe* which revealed that vaccine-tracking bracelet trials were in place nearly a year ago.

https://web.archive.org/web/20090803091728/http://www.boston.com/news/local/massachusetts/articles/2008/11/21/boston_launches_flu_shot_tracking/

"Several hundred people are expected to queue up for immunizations at the headquarters of the Boston Public Health Commission," the Boston Globe reports. "Each of them will get a bracelet printed with a unique identifier code. Information about the vaccine's recipients, and the shot, will be entered into handheld devices similar to those used by delivery truck drivers."

This effort, says the Boston Globe, is "aimed at eventually creating a citywide registry of everyone who has had a flu vaccination. The resulting vaccination map would allow swift intervention in neighborhoods left vulnerable to the fast-moving respiratory illness."

This is an open admission that the kind of scenario depicted in the fictional snapshot at the top of this article could potentially become reality. "Swift intervention" means "rapid-fire vaccinations." And people who resist those vaccines aren't going to have much of an opportunity to say no.

The worse the pandemic gets, the more aggressive these actions will become.

If people start dying from the pandemic in larger numbers, the "vaccine squads" are likely to be out in full force, injecting victims at road checkpoints and possibly even in their own homes via door-to-door sweeps. People who refuse to be vaccinated can be legally arrested and detailed by authorities, and to use the exact terms that are about to be passed into law in Mass., they can be "involuntarily transported" to a quarantine camp. Almost sounds like fun, huh? A free ride, free food, free showers... oh yeah, and a free vaccine shot, too, courtesy of the state.

To repeat, this part isn't fiction: It's written right into proposed laws that are very likely to be passed and aggressively enforced if a runaway pandemic scenario unfolds. You can read about some of these proposed laws right here: https://web.archive.org/web/20090830062013/https://www.naturalnews.com/026934_health_public_health_quarantine.html

Your papers, please

Beyond the RFID tracking technology, there's another disturbing development you need to be aware of: Law enforcement all over the country are now reportedly being briefed about the possibility of "vaccine checkpoints." These could be set up on key roads and highways, and people passing through those checkpoints will have to prove they have been vaccinated or they may face being arrested and "involuntarily transported" to a quarantine camp.

Of course, it might not take much documentation to get past the checkpoints. There's no formalized vaccine ID card that exists yet, so a letter from your doctor (or some reasonably believable rendition of such) will likely be sufficient, unless they actually mandate vaccine tracking bracelets for *everyone* (but even that would take years to implement simply due to the manufacturing and distribution logistics).

I'm also not too sure that the masses of American sheeple will be willing to wear RFID bracelets that report their real-time positions to the U.S. government. It's just a little too close to being barcoded like a Jewish prisoner in a Nazi concentration camp. People generally don't like that.

Then again, as the Boston Globe reported in 2008, hundreds of Bostonians actually lined up and *volunteered* to wear these bracelets, even knowing they would be tracked in real time by their own government. This is disturbing evidence that lots of people just can't wait to be medically enslaved by the state. Some will actually raise their hands and line up for the opportunity!

On the other end of the spectrum, there are a whole lot of people who will refuse to be medically enslaved by the state. Known as "refuseniks," these are the people like you and me who choose not to be injected with some hastily-approved chemical cocktail that's never been long-term tested on anyone. Let the volunteers be the guinea pigs, if they're really that anxious to get injected. The rest of us will take care of our own immune systems through more natural methods, thank you very much.

Action items: What to do

Here's the word for those who wish to avoid problems at vaccine checkpoints: **Acquire some "proof" of vaccination as soon as possible** after the vaccinations begin. And keep it with you at all times.

I'm not actually suggesting you get vaccinated just to get the paperwork, by the way. In fact, there's a chance you're already immune to H1N1. You may already have antibodies for the virus, meaning you've been "naturally vaccinated" even without a shot.

https://web.archive.org/web/20090922191917/https://www.naturalnews.com/027037_swine_flu_H1N1_vaccines.html

Your healthy immune system, you see, will create its own built-in vaccine upon exposure to the pandemic virus, and within a few days after being exposed, you will generate your own H1N1 antibodies, just like all the other people who were vaccinated. Except *your* antibodies will be even stronger than theirs, because you were exposed to a live virus, while they were only exposed to a weakened one (via the vaccine). So in effect, you will be far better vaccinated against H1N1 than the people who got the vaccine shots!

Even without the vaccine, H1N1 swine flu is no more fatal than a regular seasonal flu, and why should anybody have to prove they've been vaccinated against a flu that's so mild it only kills roughly 1 out of 100,000 people who get infected?

Do you realize that if *a pharmaceutical being tested in clinical trials killed the same percentage of people as the swine flu virus, it would be declared astonishingly SAFE by the FDA*? The swine flu, as currently circulating, isn't dangerous. It's the vaccines that pose the greater risk to your health, in my view. Only time will tell how many people the vaccines end up killing, of course.

Are nasal vaccines safer?

Should you, for some reason, wish to actually get a vaccine in order to acquire vaccine documentation, I recommend nasal vaccines over injected vaccines. They're inherently safer, in my view, because the nose is one of the natural pathways through which viruses enter your body anyway (as opposed to a hole in your arm). Nasal vaccines don't contain thimerosal, either.

The FluMist nasal vaccine, just so you know, contains "Live Attenuated Influenza Vaccine," meaning it is made out of live viruses. https://web.archive.org/web/20091017010927/https://www.cdc.gov/FLU/about/qa/nasalspray.htm

But your uncle Charlie probably also contains live influenza, so this isn't anything to be too worried about. If you plan to get lots of rest, have strong immune system support, get lots of vitamin D and spend a few days recuperating with little or no stress, your chances of being harmed by the nasal vaccine are virtually nil, unless you're obese and suffer from a preexisting respiratory condition or immune system problem, in which case you shouldn't be receiving a nasal vaccine in the first place.

If you actually do get a vaccine, hold on to the paperwork. That's what will get you through the vaccine checkpoints, if they are indeed put into play. In reality, there are likely to be hundreds of different documents showing "proof" of vaccination, so anything that looks even remotely convincing will probably get you through. What the checkpoint police will really be looking for are people who are completely clueless and haven't gone through the trouble to come up with any paperwork at all. Those are the ones likely to be injected or detained.

Dealing with a mandatory RFID bracelet

So what happens if everybody is required to wear RFID bracelets that track their whereabouts and vaccination status?

I think this is highly unlikely in the short term, as there probably aren't enough bracelets to go around (unless huge truckloads of bracelets have been secretly manufactured and stored somewhere, which seems really unlikely). But I wouldn't put it past these people in the medium term: This is the perfect way to enslave the population under some medical pretext. Some percentage of the population will even line up and volunteer to be outfitted with such devices.

If such bracelets do get forced upon the population, within a few days you'll start to see websites appearing on the 'net with instructions for hacking or disabling your bracelet. Since those websites don't exist yet, I can't point you to them, but it's a fairly easy Google search on the term "disable RFID." That search will pull up sites like this one: http://blog.makezine.com/archive/2008/04/how_to_disable_rfid_tags.html

=> The easiest way to kill an RFID, and be sure that it is dead, is to throw it in the microwave fo*r 5 seconds. Doing this will literally melt the chip and antenna making it impossible for the chip to ever be read again. Unfortunately this method has a certain fire risk associated with it. Killing an RFID chip this way will also leave visible evidence that it has been tampered with, making it an unsuitable method for killing the RFID tag in passports. Doing this to a credit card will probably also screw with the magnetic strip on the back making it un-swipeable.*

And that website advises the following:

"The last (and most covert) method for destroying a RFID tag is to hit it with a hammer. Just pick up any ordinary hammer and give the chip a few swift hard whacks. This will destroy the chip, and leave no evidence that the tag has been tampered with. This method is suitable for destroying the tags in passports, because there will be no proof that you intentionally destroyed the chip."

Obviously, don't hit the bracelet with a hammer if you are still wearing it, or the RFID chip won't be the only thing you'll disable. Anyone who fails this intelligence test should probably just put the bracelet back on and hopelessly do what they're told.

Don't worry about being caught with a "failed" chip. Chip failures will be common, so the authorities will be used to the idea that a lot of bracelets just don't work correctly. If they ask why yours isn't working, just shrug and say, "Dunno. I thought it was working fine. Maybe it got bumped or something..."

Don't freak out over this

So is this RFID tracking bracelet a sign of things to come? Possibly. They're clearly experimenting with the technology not only to see how well the tech works, but more importantly to get some answers on the psychology: Will people accept tracking bracelets? Will they feel protected, or enslaved? Will they try to remove or disable the bracelets?

For now, I'm not aware of any serious talk of tracking bracelets being made mandatory, nor is there even any real chatter about making swine flu vaccinations mandatory for the public at large (although certain professionals such as day care workers and hospital staffers are being told to get vaccinated or lose their jobs...). But all this could change almost overnight. One mutation of H1N1 could rewrite the entire play book on this by increasing the fatality rate of the infection. From there, it would be a simple matter for vaccination mandates to be swiftly put into place, and mandatory tracking bracelets could soon follow.

Let's hope that scenario doesn't unfold. I know there are many good law enforcement professionals out there who would never go along with such a Nazi-inspired medical enslavement scheme, but sadly there are more than enough who will be willing to follow orders and carry through with whatever they're told to do. Let us hope our law enforcement community is never forced to make that decision.

If things get worse, however, be prepared to produce your vaccination documentation ("papers, please") at roadblocks and checkpoints. And make sure you dutifully wear your vaccination RFID tracking bracelet, too, even if you've hammered the RFID chip into scrap.

Majority of U.S. parents wary of H1N1 vaccine: poll

Reuters, 30 September // 1 October 2009, 6:48 am.
https://www.reuters.com/article/us-flu-vaccines-poll-idUSTRE58T7NZ20090930

Washington (Reuters) – Nearly two-thirds of U.S. parents say they will hold off having their children vaccinated against the H1N1 swine flu or will not get them immunized at all, according to a survey released on Wednesday.

The findings, published by Consumer Reports, underscore one of the main challenges facing the Obama administration as it readies a massive swine flu vaccination roll-out – how to persuade the most vulnerable people to protect themselves against the new virus.

H1N1, which emerged last March and became a pandemic in June, puts children and young people at greater risk than the elderly for severe illness and death. Pregnant women and people with underlying medical problems such as lung disease or diabetes are at higher risk.

Consumer Reports, a magazine published by the nonprofit advocacy group Consumers Union, surveyed 1,502 adults by telephone from September 2-7. It found that 50 percent of parents are delaying the vaccination decision, mainly because they were wary about whether the new H1N1 vaccine has been tested enough. The same concerns were shared by 14 percent of parents who have ruled out vaccination altogether.

About 35 percent of adults surveyed said they would definitely have their children vaccinated, significantly higher than the 22 percent of 5- to 18-year-olds who are immunized in a typical year, according to federal statistics. The survey also found 43 percent of parents were not too worried about their children contracting H1N1, while about the same number worried about other parents overreacting.

The poll has a 3 percentage point margin of error and was taken before the U.S. Food and Drug Administration approved new vaccines for the H1N1 virus.

Immunization Campaign

Preliminary test results have since shown children respond to the new vaccine just as they do to seasonal flu vaccines, with those over age 10 needing a single dose but children under 9 needing two.

Consumer Reports said it recommends that people within high risk groups consider immunization when the vaccine starts to become available next month.

The U.S. government has ordered vaccine from MedImmune, a unit of AstraZeneca, Sanofi-Aventis, Australia's CSL, GlaxoSmithKline and Novartis. U.S. health officials, who say immunization provides the best protection against flu infection, warn that low vaccine demand could now have dire consequences.

The elderly are a prime target for seasonal flu strains that kill about 36,000 people during mild outbreaks. But officials warn that many of those deaths this season could be children aged 18 and under.

The Obama administration plans to begin distributing vaccine doses next week as part of an immunization campaign that should ramp up to over 250 million doses by the end of the year.

H1N1, currently the dominant flu strain, has infected millions of people in the United States, and in late summer, intensified strongly in the U.S. Southeast where the school year tends to begin early.

EurekAlert! AAAS

Harvard T.H. Chan School of Public Health

Survey finds just 40 percent of adults 'absolutely certain' they will get H1N1 vaccine

EurekAlert, 2 October 2009
https://www.eurekalert.org/news-releases/900760
https://scienceblog.com/25814/survey-finds-just-40-percent-of-adults-absolutely-certain-they-will-get-h1n1-vaccine/

Major reasons people saying 'no' or 'maybe' to vaccine include belief they are at low risk of illness and concerns about vaccine safety

Boston, MA – In a new survey, Harvard School of Public Health (HSPH) researchers found that just 40% of adults are "absolutely certain" they will get the H1N1 vaccine for themselves, and 51% of parents are "absolutely certain" that they will get the vaccine for their children. The survey examined the reasoning among those who said they would not get the vaccine or might not. This is the latest in a series of surveys of public views concerning the H1N1 flu outbreak undertaken by the Harvard Opinion Research Program at HSPH. The polling was done September 14-20, 2009.

Public mixed on getting vaccine, but interest may jump if outbreak is severe

About six in ten adults are not "absolutely certain" they will get the H1N1 vaccine for themselves, including 41% who say they will not get it, 6% who say they don't know if they will get it, and 11% who say they are planning to get it but may change their mind. About four in ten parents (44%) are not "absolutely certain" that they will get the vaccine for their children, including 21% who will not get it, 7% who don't know, and 16% who say they are planning to get it but may change their mind.

If there were people in their community who were sick or dying from H1N1, roughly six in ten adults (59%) who say they do not think they'll get the vaccine would change their mind and get it for themselves. About the same percentage of parents (60%) who say they do not think they'll get the vaccine for their children would change their minds if H1N1 was causing sickness or death in their community.

"These findings suggest that public health officials need to be prepared for a surge in demand for the H1N1 vaccine if the H1N1 flu becomes more severe," said Robert J. Blendon, Professor of Health Policy and Political Analysis at HSPH.

Major Reasons for Not Getting Vaccine or Being Unsure

Those who were not "absolutely certain" they will get the H1N1 vaccine cited the following as the top "major" reasons for their thinking: (1) they are concerned about getting side effects from the vaccine (30%); (2) they don't think they are at risk of getting a serious case of the illness (28%); and (3) they think they could get medication to treat H1N1 if they do get sick (26%). The top "major" reasons cited by parents who are not "absolutely sure" they will get the vaccine are that (1) they are concerned about side effects of the vaccine (38%); (2) they are concerned that their children could get other illnesses from the vaccine (33%); and (3) they do not trust public health officials to provide correct information about the safety of the vaccine (31%).

"There's still a lot of uncertainty about what people will ultimately do in terms of getting the vaccine. If public health officials want to encourage a larger number of people to get vaccinated this fall, they will need to address the public's concerns in the coming weeks," said Blendon.

Safety Concerns

At this point in time, only about a third (33%) of the public sees the H1N1 vaccine as very safe "generally for most people to take." By comparison, the figure is 57% for the seasonal flu vaccine. A smaller fraction of the public thinks the H1N1 vaccine is very safe for particular groups to take, including children ages 6 months to 2 years (18%) and pregnant women (13%). The Centers for Disease Control is encouraging these groups, among others, to get the vaccine as early as possible.

Concerns About Outbreak on the Rise

Public concern about a fall or winter outbreak of H1N1 has risen since June. Roughly three-quarters of the public (76%) believe there will be widespread cases of H1N1 this fall or winter with people getting very sick, which is an increase from June when only 59% felt the same way. More people are also now concerned that they or someone in their immediate family will get sick from H1N1 during the next 12 months (52% in later September, as compared to 38% in June). Roughly two-thirds of people (64%) think that public health officials' concerns about a possible outbreak have been justified, while one third (31%) think that they have been overblown.

This poll is part of a series of polls about the way that Americans and their institutions are responding to the H1N1 flu outbreak. The first three focus on the American public, and the fourth focuses on views of businesses across the United States.

Methodology

This poll is part of an on-going series of surveys focused on the public and biological security by the Harvard Opinion Research Program (HORP) at Harvard School of Public Health. The study was designed and analyzed by researchers at the Harvard School of Public Health (HSPH). The project director is Robert J. Blendon of the Harvard School of Public Health. The research team also includes Gillian K. SteelFisher, John M. Benson, and Kathleen J. Weldon of the Harvard School of Public Health, and Melissa J. Herrmann of SSRS/ICR. Fieldwork was conducted via telephone (including both landline and cell phone) for HORP by SSRS/ICR of Media (PA) September 14-20, 2009.

The survey was conducted with a representative national sample of 1,042 adults age 18 and over, including oversamples of non-Hispanic African Americans and Hispanics. Altogether, 144 non-Hispanic African Americans and 126 Hispanics were interviewed. In the overall results, these groups were weighted to their actual proportion of the total adult population.

The margin of error for the total sample is plus or minus 3.7 percentage points. Possible sources of non-sampling error include non-response bias, as well as question wording and ordering effects. Non-response in telephone surveys produces some known biases in survey-derived estimates because participation tends to vary for different subgroups of the population. To compensate for these known biases, sample data are weighted to the most recent Census data available from the Current Population Survey for gender, age, race, education, region, and number of adults in the household. Other techniques, including random-digit dialing, replicate subsamples, and systematic respondent selection within households, are used to ensure that the sample is representative.

Harvard Survey: Only one third of Americans believe swine flu vaccine is safe
Worries about vaccine's side effects outweigh worries about swine flu

Infowars, 2 October 2009
https://web.archive.org/web/20100105094352/http://www.infowars.net/articles/october2009/021009poll.htm

A survey conducted by Harvard University has found that only *one third of adults trust the safety* of the imminently available H1N1 vaccine.

Just 40% of respondents said they would take the swine flu shot in the poll carried out by Harvard Opinion Research Program at Harvard School of Public Health.

The study, funded under a cooperative agreement with the Centers for Disease Control and Prevention, also found that respondents were worried about side effects or not concerned about catching the flu at all.

44% of respondents who were parents said they were unsure over getting their children vaccinated against H1N1, with 21% of those parents saying they absolutely will not allow their kids to be vaccinated.

Parents said that they were concerned about their children getting other illnesses from the vaccine and that they do not trust public health officials to tell them about vaccine safety.

The results show a great public distrust in the vaccine with just one third (33%) of the public viewing the H1N1 vaccine as very safe "generally for most people to take". Even less (18%) believe it is safe for children aged 6 months to 2 years, and only 13% feel it is safe for pregnant women.

Almost one third (31%) of respondents think that public health officials' concerns over H1N1 flu have been overblown.

Of the 40% of adults who said they would not take the shot, the majority said they may reconsider if people begin dying from the virus en mass.

The survey was conducted with a broad representative national sample of 1042 adults aged 18 and over.

The survey dovetails with a similar poll from *Consumer Reports*, one of the top-ten-circulation magazines in the country, that found almost two thirds of Americans would either refuse the vaccine outright or wait for more information before considering vaccinating their children.

As we have previously reported, both the GlaxoSmithKilne and the Novartis H1N1 vaccines contain both the novel adjuvant squalene, which has been linked to Gulf War Syndrome, and thimerosal, the mercury based preservative that some scientists have testified can cause brain disorders.

The vaccines have been rushed through safety procedures while the government has provided pharmaceutical companies with blanket immunity from lawsuits arriving out of the vaccine causing deaths and injuries.

In related news, more hospitals are demanding that workers be mandated to take the H1N1 shot, while Sacramento International Airport is to offer vaccinations in its terminals in a precedent setting move that critics have described as concerning.

Arkansas DHS vaccinates 36 children with swine flu vaccine against parents objections

Examiner, 3 October 2009, 10:06 AM

https://web.archive.org/web/20100410113450/http://www.examiner.com/x-14537-Albany-CPS-and-Family-Court-Examiner~y2009m10d3-Arkansas-DHS-vaccinates-36-children-with-swine-flu-vaccine-against-parents-objections

In a radio interview with Greg Szymanski on September 30, Cheryl Barnes founder of CPS Legal Watch, revealed that the State of Arkansas has given 36 children the swine flu vaccine against their parents' wishes. The 36 children were taken into custody last fall by the Department of Human Services because the state said they were in jeopardy due to their parents' involvement with the Tony Alamo Ministries Church.

The State of Arkansas does require that children get immunized if they are attending school. However, Arkansas does allow for religious and medical exemptions. The parents of the 36 children did not want their children vaccinated because it is against their religious beliefs.

According to Barnes, all 36 children have received at least one of the three series of H1N1 flu shots and some have received all three.

The swine flu vaccine has come under fire from a number of people from a variety of backgrounds and beliefs who have alleged that it is not safe. Health care workers in New York State have been ordered by the New York State Department of Health to get immunized against the swine flu. Some health care workers have been fired for refusing to get immunized and health care workers have held protests in Albany.

Barnes also stated that the 36 children in Arkansas have been vaccinated against other illnesses against their parents' religious beliefs, including the vaccination of all of the girls with Gardasil.

Attorneys for CPS Legal Watch filed a motion to stop the vaccinations of these children, but the judge sat on it for six weeks, after which in many cases it was moot, because the children had already been vaccinated and because Judge Griffin of Miller County had terminated the parental rights of some of the parents.

Even though all states allow for medical exemptions for vaccinations and all but two states allow for religious exemptions, parents have been charged with medical neglect for not immunizing their children according to www.mothering.com/cps.

Just 40% of U.S. adults "absolutely certain" they will get A/H1N1 vaccine: survey

News XinhuaNet, 3 October 2009, 13:10

https://web.archive.org/web/20091006082400/http://news.xinhuanet.com/english/2009-10/03/content_12176509.htm

Washington, Oct. 2 (Xinhua) – Only 40 percent of U.S. adults are "absolutely certain" they will get the A/H1N1 vaccine for themselves, and 51 percent of parents are "absolutely certain" that they will get the vaccine for their children, a study of Harvard School of Public Health (HSPH) researchers showed on Friday.

The Harvard researchers polled 1,042 U.S. adults for what they said was a representative sample of national opinion on Sept. 14-20.

According to the survey released Friday, however, if there were people in their community who were sick or dying from A/H1N1 virus, about 60 percent of the people who used to say that they didn't think they would get the vaccine would change their mind and get it for themselves and their children.

"These findings suggest that public health officials need to be prepared for a surge in demand for the A/H1N1 vaccine if the A/H1N1 flu becomes more severe," said Robert J. Blendon, Professor of Health Policy and Political Analysis at HSPH.

Those who are not "absolutely certain" they will get the vaccine cited the following as the top "major" reasons for their thinking: (1) they are concerned about getting side effects from the vaccine (30 percent); (2) they don't think they are at risk of getting a serious case of the illness (28 percent); and (3) they think they could get medication to treat A/H1N1 if they do get sick (26 percent).

The top "major" reasons cited by parents who are not "absolutely sure" they will get the vaccine are that (1) they are concerned about side effects of the vaccine (38 percent); (2) they are concerned that their children could get other illnesses from the vaccine (33 percent); and (3) they do not trust public health officials to provide correct information about the safety of the vaccine (31 percent).

"There's still a lot of uncertainty about what people will ultimately do in terms of getting the vaccine. If public health officials want to encourage a larger number of people to get vaccinated this fall, they will need to address the public's concerns in the coming weeks," said Blendon, who led the survey.

Are populations being primed for nano-microchips inside vaccines?

Prevent Disease, 5 October 2009
https://web.archive.org/web/20100102030426/http://preventdisease.com/news/09/100509_injectable_nano_microchips.shtml

It's almost surreal, like something out of a sci-fi flick, but nano-microchips invisible to the naked eye are a reality that are already being hosted in wide-range of applications. The question is, how long will it take governments and big pharma to immerse nano-microchips inside of vaccines to tag and surveil global populations?

Nanotechnology deals with structures smaller than one micrometer (less than 1/30th the width of a human hair), and involves developing materials or devices within that size. To put the size of a nanometer in perspective, it is 100,000 times smaller than the width of a human hair.

...

Scientists working at Queen Mary, University of London, have developed micrometer-sized capsules to *safely deliver drugs inside living cells*. These "micro shuttles" could hypothetically be loaded with a specific microchip controlling the dose of medication to be opened remotely, releasing their contents. Besides monitoring the dosage, the same microchip could be used to surveil the patient in conjunction with various tracking systems.

Scientists in the United Kingdom have recently reported advances towards overcoming key challenges in nanotechnology. They demonstrated how *nanoparticles could move quickly in a desired direction without help from outside forces*. Their achievement has broad implications, the scientists say, raising the possibility of coaxing cells to move and grow in specific directions.

Doug Dorst, a microbiologist and vaccine critic in South Wales, says these advances have an immense appeal to vaccine makers. "Biotech companies and their researchers have quickly moved most funding initiatives towards nanotechnology to increase the potency of their vaccines," he said. If microorganisms inside of vaccines can be coaxed into targeting or invading specific cells, they could achieve their goal at an accelerated rate over conventional vaccines. "Depending on which side of the vaccine debate you're on, whether pro or con, nanobots inside vaccine preparations could advance their effectiveness exponentially by either dramatically improving or destroying immunity depending on their design," he added.

...

The *worry for Dorst* is that one day vaccines "will do what they've always been intended for...*control of the global populace*."

Nanoemulsion platforms are already capable of developing vaccines from very diverse materials. Mixtures of soybean oil, alcohol, water and detergents can be emulsified into ultra-small particles smaller than 400 nanometers wide (about 1/200th the width of a human hair). These could *be combined with any number of nano-microchips* with all or part of disease-causing microbes to trigger the body's immune system.

In 2007 researchers at the Ecole Polytechnique Fédérale de Lausanne (EPFL) announced in an article in the journal, Nature Biotechnology, that they had developed a "*nanoparticle that can*

deliver vaccines more effectively, with fewer side effects, and at a fraction of the cost of current vaccine technologies." The article went on to describe the effects of their breakthrough: "At a mere 25 nanometers, these particles are so tiny that once injected, they flow through the skin's extracellular matrix, making a beeline to the lymph nodes. Within minutes, they've reached a concentration of DCs thousands of times greater than in the skin."

...

The human body is very resistant to nanoparticles that attempt to invade human cells. Scientists are intensely *investigating methods to disrupt human enzymes that may degrade nanoparticles*. Experts at the University of Liverpool found a way around this obstacle that could mean more efficient, topical drugs in the future, which could act a whole lot faster than the ones currently in use.

...

In December 2000, Former Chief Medical Officer of Finland, Rauni-Leena Luukanen-Kilde, MD stated that *it is technically possible for every newborn to be injected with a microchip*, which could then function to identify the person for the rest of his or her life. Such plans are secretly being discussed in the U.S. without any public airing of the privacy issues involved.

Today's microchips operate by means of low-frequency radio waves that target them. With the help of satellites, the implanted person can be tracked anywhere on the globe. Such a technique was among a number tested in the Iraq war, according to Dr. Carl Sanders, who invented the intelligence-manned interface (IMI) biotic, which is injected into people. (Earlier during the Vietnam War, soldiers were injected with the *Rambo chip*, designed to increase adrenaline flow into the bloodstream). The 20-billion-bit/second supercomputers at the U.S. National Security Agency (NSA) could now "see and hear" *what soldiers experience in the battlefield* with a remote monitoring system (RMS).

...

Every thought, reaction, hearing, and visual observation causes a certain neurological potential, spikes, and patterns in the brain and its electromagnetic fields, which *can now be decoded* into thoughts, pictures, and voices. Electromagnetic stimulation can therefore change a person's brainwaves and affect muscular activity, causing painful muscular cramps experienced as torture.

The NSA's electronic surveillance system can *simultaneously follow and handle millions of people*. Each of us has a unique bioelectrical resonance frequency in the brain, just as we have unique fingerprints. With electromagnetic frequency (EMF) brain stimulation fully coded, pulsating electromagnetic signals can be sent to the brain, causing the desired voice and visual effects to be experienced by the target. This is a form of electronic warfare. U.S. astronauts were implanted before they were sent into space so *their thoughts could be followed and all their emotions could be registered 24 hours a day*.

The mass media has not reported that an implanted person's *privacy vanishes for the rest of his or her life*. S/he *can be manipulated in many ways*. *Using different frequencies*, the secret controller of this equipment can even change a person's emotional life. S/he can be made aggressive or lethargic. Sexuality can be artificially influenced. Thought signals and subconscious thinking can be read, dreams affected and even induced, all without the knowledge or consent of the implanted person.

This *secret technology has been used by military forces in certain NATO countries* since the 1980s without civilian and academic populations having heard anything about it. Thus, little information about such invasive mind-control systems is available in professional and academic journals.

The NSA's Signals Intelligence group *can remotely monitor information from human brains* by decoding the evoked potentials (3.50HZ, 5 milliwatt) emitted by the brain. Prisoner experimentees in both Gothenburg, Sweden and Vienna, Austria have been found to have evident brain lesions. Diminished blood circulation and lack of oxygen in the right temporal frontal lobes result where brain implants are usually operative. A Finnish experimentee experienced brain atrophy and intermittent attacks of unconsciousness due to lack of oxygen.

Targeting people's brain functions with electromagnetic fields and beams (from helicopters and airplanes, satellites, from parked vans, neighboring houses, telephone poles, electrical appliances,

mobile phones, TV, radio, etc.) is part of the radiation problem that should be addressed by democratically elected governments. However, there is currently no interest by any national government to seriously address this issue.

The timeline for integrating nano-microchips inside of vaccines is speculative. It could be just a few years, months or perhaps it is here and we already unaware of their integration within pharmaceuticals. Regardless, due to the many military and political advantages, their implementation is inevitable.

However fraudulent, it was an imperative for world powers and pharmaceutical cartels to promote the effectiveness of vaccinations and enact national pandemic preparedness policies which mandate vaccinations.

In 2005 the World Health Organization (WHO) *developed international health regulations* that would bind all 194 member countries to pandemic emergency guidelines which could enforce such a mandate. Without these procedures of public health (and propagandized vaccine campaigns) in place, there would be little or no voluntary cooperation from the public to roll up their sleeves and accept the inoculations. Public participation is an essential tool that will soon *allow big pharma to inject the most effective surveillence tool* ever designed into billions of people.

Although nanotechnology manufacturing is currently available on a global scale, before biotech companies are able to initiate mass production and testing of nano-microchips inside of vaccines, *they will likely sell the idea to the public*. Through various "*health enhancement scenarios*" they will encourage participation and publicly announce regulatory approval from the same policies and regulatory agencies they helped create.

By mid-summer of 2009, the WHO and the Center of Disease Control (CDC) *effectively hyped a false flu pandemic and convinced the world to submit to H1N1 vaccines*. Additional doses of propaganda and possibly a biological event, may equally convince populations to knowingly accept microchips inside of vaccines under the guise of a "greater good" for humanity.

When our brain functions are already connected to supercomputers by means of radio implants and microchips, *it will be too late for protest*. This threat can be defeated only by educating the public, using available literature on biotelemetry, nanorobotics and information exchanged at international congresses.

The time to act is now!

The obvious danger with nano vaccine technology is greedy scientists controlled by tyrannical governments can use it for sterlization, surveillance and genocide.

Erin Allday

Swine flu draws a shrug, field poll shows

SF Gate, 6 October 2009
https://www.sfgate.com/health/article/swine-flu-draws-a-shrug-field-poll-finds-3215546.php

Half of Californians are not particularly worried about the swine flu, and most people trust that the state has the resources to keep them healthy if an influenza outbreak occurs, according to a recent Field Poll survey released Monday.

Despite repeated messages from federal and state officials that the swine flu - a form of influenza Type A, subtype H1N1 - could be a serious public health threat, 49 percent of survey respondents said they were not very concerned about the virus or not concerned at all.

Bay Area respondents were especially worry-free - 54 percent said they were not very concerned about the flu or not concerned at all.

"I think it's just a big, old massive media hype and it's kind of ridiculous," said Alicia Terra of San Jose, who participated in the survey.

The survey results are important to public health officials who are in the middle of planning large-scale immunization campaigns to stop spread of the swine flu. If people aren't concerned about the flu, they aren't as likely to get the vaccine, federal public health officials have said.

There were some marked differences in opinion in the state based on race and gender. Latino respondents were particularly worried about the swine flu - 62 percent said they were somewhat or very concerned. Among women, 57 percent were somewhat or very concerned compared with 46 percent of men who felt the same way.

Despite the overall relative lack of concern, 72 percent of survey respondents said they'd be somewhat or very likely to get the vaccine if doctors or public health officials recommended it.

Respondents didn't appear to be worried that recent budget cutbacks - especially to public health - have affected the state's ability to respond to a flu outbreak if it occurs. More than two-thirds of those polled said they were somewhat or very confident that the state could respond effectively.

"I honestly believe that our health care professionals are well informed and understand what needs to be done," said Theresa Bennett-Wilkes of Oakland, who took the survey.

The Field Poll surveyed 957 registered voters in California between Sept. 18 and Oct. 4. All participants were asked about their level of concern about the swine flu, but only about half were asked follow-up questions on the state's level of preparedness and whether or not they would be vaccinated.

There was a 3.3 to 4.5 percent margin of error depending on the question asked.

WHALE

THEY FEAR THOSE WITH KNOWLEDGE AND CONTROL THOSE WITHOUT IT

Richard Gale & Gary Null

The Centers for Disease Control:
The Best Vaccination PR Firm Taxes Can Buy

Progressive Radio Network, 7 October 2009.
http://www.whale.to/vaccine/nullcdc.html

One hard lesson we should have learned after Wall Street's collapse and the government's handling of the bailout is that there is no reason, whatsoever, for us to sacrifice our good faith and trust in former bankers who now run the Treasury and Federal Reserve. And now as the flu season gets ready to kick off amidst much fanfare and predictions of doom due to a new H1N1 influenza virus, there is emerging sufficient information to raise very serious doubts whether our nation's health authorities are truly serving the public health instead of commercial interests.

If the flu season goes according to schedule, the vaccine industrial complex will be poised to join Wall Street for record year rip-off profits. We will also likely witness huge Pharma executive bonuses and perhaps gold-plated toilets. Even if the CDC statisticians' crystal ball used to forecast rampant swine flu infections turns into a complete bust – which would only be one more added to many other failed flu predictions back to 1976 – it will nevertheless be a very profitable failure as was the economic collapse for the banking cartel. The vaccine industry has now received orders in the range of 3 billion doses during the course of the coming flu season. The World Health Organization would like to vaccinate two thirds (4 billion) of the global community, and the US alone is spending $2 billion to stockpile the nation with upwards to 250 million doses.

In the US, such profits could never be accomplished without a dynamic, marketing initiative to convince Americans that vaccines will keep them protected and alive. And what better public relations machine for the vaccine complex, and all its supporters in health insurance and professional medical institutions, than our very own Centers for Disease Control and the Department of Health and Human Services. Even better, our tax dollars are there to pay for it all. We pay for the comfort in knowing that the CDC's disinformation campaign will continue to scare us over the major networks and the *New York Times*. We can also assure vaccine makers that once and for all they are protected from liability in the event of serious flu vaccine injuries.

Nevertheless, the government has a lot of vaccine vials to distribute, therefore, the CDC needs to sustain the fiction of numerous elderly dying in nursing homes, unvaccinated pregnant moms and children facing life threatening complications, and scores of sick and dead burnt into our national subconscious. It is all part of the CDC's script to get citizens rushing to their doctors and Wal-Marts to be vaccinated.

Peter Doshi, while at Harvard in the mid-2000s, published a devastating study in the *British Medical Journal* that systematically unveils the flawed predictive science used to publicize our health agencies' influenza statistics and mortality rates. His analysis shook up enough health authorities to warrant twelve scientists from the CDC and National Institutes of Health to unsuccessfully take him on. Now at MIT, Doshi continues his analysis of a century's worth of influenza mortality data and government manipulation of influenza data, such as the annual figure of 36,000 influenza deaths we hear and read repeatedly.[1] Although this magical number was for all practical purposes alchemically conjured up via mathematical modeling back in 2003, it continues to be the most holy number in the CDC's PR vocabulary every flu season. Doshi draws the conclusion, published in the *American Journal of Public Health,* that commercial interests are playing the role of science in both industry and government.[2]

Deconstruction of the CDC's cherry-picked science and a growing anti-vaccination community are just some of the obstacles health authorities face. Therefore, no public relations strategy can have a solid multimedia punch on American citizens without opinion leaders serving as the gnomes for the vaccine complex and our heavily invested government health agencies, which are about to be buried in millions of purchased vaccine vials eager for distribution. This effort requires shock troopers, such as the pro-vaccine prophet Dr. Paul Offit, the creator of the rotavirus vaccine and a staunch critic against any scientist who discovers an association between vaccines and severe neurological disorders. Dr. Offit is on record for an audacious comment that children can tolerate 100,000 vaccinations (yes, you read that number correctly).[3]

However, during this particular flu season, government health officials' may have a more difficult time convincing Americans to be vaccinated for swine flu if recent polls are reliable indicators. The latest Consumers Union poll released on September 30 shows almost two-thirds of parents will withhold vaccinating their children; fifty percent of respondents' rationale is that the vaccine has not been tested thoroughly for safety.[4] A poll of pregnant mothers conducted by the internet parent support group Mumsnet.com indicates women are turning more suspicious about the flu vaccine's true efficacy and safety. The survey of 1500 respondents found only 6 percent of pregnant women "definitely" taking the shot, while 48 percent said they "definitely" wouldn't. A parallel poll revealed only 5 percent would definitely vaccinate their children.[5] A more recent *San Francisco Chronicle* survey finds 54 percent saying the H1N1 flu is nothing to be worried about.[6]

A separate study conducted by Harvard's School of Public Health showed that among the 41 percent who would not get the shot, 44 percent of parents are uncertain they would allow their children to receive it. Aside from many who expressed a fear of the vaccine's side effects, the poll found 31 percent expressing a distrust in our public health officials providing accurate information on vaccine safety.[7] Therefore, expect an aggressive government public relations campaign during the coming weeks and even months, while our tax dollars are spent on 250 million shots that independent epidemiological evidence is showing may be ineffective at best, and dangerous at worst.

European polls indicate that our neighbors on the other side of the great pond are less nervous about the H1N1 strain's severity and far more suspicious towards health officials' rationale for hyping dire warnings of swine flu's dangers. In France, *Le Figaro* conducted a poll of 12,050 people showing 69 percent will refuse the vaccination. In a separate French survey, one third of 4,752 doctors, nurses and healthcare workers surveyed would not be inoculated.[8] Twenty-nine percent of Germans surveyed said they would refuse it "under any circumstance" and an additional 33 percent would likely refuse it. In the region of Bavaria and Baden Wurttemburg, only 10 percent of those polled said they would submit their arms to injection. In the UK, a couple polls reported in the *Daily Mail* last August, showed half of family physicians and a third of UK nurses do not want the swine flu vaccination. Seventy-one percent do not believe the vaccine has been tested enough for safety and the swine flu is much milder than health authorities are saying.

During the course of the CDC's media war to push forward the vaccine industry's greed for profit, science and reflective caution are being sacrificed. An important peer-reviewed study appearing in the June 2009 issue of *Toxicological and Environmental Chemistry* shows a causal relationship between the amounts of ethylmercury (thimerosal) found in inoculations for infants, when administered to monkeys, and cellular toxicity resulting in mitochondrial dysfunction, impaired oxidative reduction activity and degeneration and death in neuronal and fetal cells.[9] These are all indicative signs found in some ASD. But health officials prefer to ignore such results. For the future health of American children, the study's findings arrive at a bad time when a recent Harvard study now reports autistic spectrum disorders (ASD) has risen to 1 in 91 people compared to the earlier 1 in 150 estimate. But since the study was sponsored by the CDC, the press release makes no indication that just maybe the over-vaccination of children with dozens of injections by the age of 5 years might be a causal factor behind this national epidemic of ASD and other neurological disorders.

During the course of interviewing many parents of autistic children for our documentaries *Vaccine Nation* and *Autism: Made in the USA*, the personal stories we filmed repeatedly were that of a once perfectly healthy and joyful child who, shortly after a vaccination or a series of injections, simply

vanished from normality. However, national health policy today seems to have almost legislated by divine decree that there is no relationship between vaccine ingredients and autism. Besides, further independent research and first-hand personal stories would only interfere with the propaganda machine and the CDC's "Seven Step Recipe for Generating Interest In, and Demand for, Flu Vaccination."

Peter Doshi first brought public attention to the CDC's PR influenza strategy known as the Seven Step Recipe. Glen Nowak, now the Director of the CDC's Media Relations, outlined a concise public relations template while serving as the communications spokesperson for the National Immunization Program. Speaking at the 2004 National Influenza Vaccine Summit, he presented the CDC's seven steps. After a careful review of Nowak's Powerpoint presentation we discover a very detailed and concerted PR and multimedia campaign that includes the following (quotes are from CDC's materials):

- To encourage the belief that influenza infection can "occur among people for whom influenza is not generally perceived to cause serious complications (e.g., children, healthy adults, healthy seniors)." In other words, promote flu vaccination to those who don't really need it.
- In order to "foster the demand for flu vaccinations" the CDC should target "medical experts and public health authorities publicly (e.g., via media) [to] state concern and alarm (and predict dire outcomes) – and urge influenza vaccination."
- By focusing on the message of dire health threats and human casualties upon those who don't really need to be vaccinated, the CDC will reach its milestone of "framing of the flu season in terms that motivate behavior (e.g., as "very severe," "more severe than last or past years," "deadly")."
- Throughout the flu season, the campaign would continue issuing reports "from health officials and media" to emphasize that "influenza is causing severe illness and/or affecting lots of people – helping foster the perception that many people are susceptible to a bad case of influenza."
- Of course, no marketing strategy is thorough without images. Ergo another ingredient in the recipe is to use "visible/tangible examples of the seriousness of the illness (e.g., pictures of children, families of those affected coming forward) and people getting vaccinated (the first to motivate, the latter to reinforce)."

The CDC's "key points" indicate we are now in that critical timeframe for the CDC to distribute materials to "a variety of partners." This includes aggressively disseminating all medical reports, studies and PR spins to the soporific media and corporate-funded medical associations to support the government's mass vaccination efforts. Come November, we will begin to see reports on "pediatric deaths" due to influenza – although Dr. Martin Meltzer, a CDC expert in health economics, has stated "almost nobody dies of the flu" and "deaths [are] associated with flu, but not necessarily caused by flu."[10] Apparently, the folks over in the various CDC departments and our different federal health agencies don't communicate with each other very well.

So why should our tax dollars go towards fabricating and/or ignoring science in order to vaccinate Americans? Nowak publicly stated the CDC's reasons on National Public Radio, "… the manufacturers were telling us that they weren't receiving a lot of orders for vaccine for use in November or even December … It really did look like we [CDC] needed to do something to encourage people to get a flu shot.[11]

At this moment, we are witnessing a steady flow press releases and articles in the media to convert Americans to the wisdom of national health vaccination policy. The National Institute of Allergy and Infectious Diseases (NIAID) has issued preliminary positive results from an uncompleted clinical trial testing the H1N1 vaccine on children and young people between 6 months and 17 years of age. The fact that the entire study only enrolled 70 individuals covering this age range should alone raise red flags about any reliable conclusions after the study is completed. Moreover, the study is specifically designed for measuring the necessary immune response to protect youth from the swine flu. It is not a safety study. We usually expect that sound scientific ethics demand clinical trials to be reported after a final analysis of research data, however, the CDC's Seven Step Recipe is not concerned with scientific facts, or rigorous research protocol. It is simply part of the PR game plan to get people vaccinated and to do it fast.

Donald McNeil, a shill for the vaccine complex writing for the *New York Times* has printed two recent articles aligned with CDC propaganda. He quotes Dr. Jay Butler, chief of the swine flu vaccine task force at the CDC in order to relieve fears about flu vaccine adverse effects, especially to pregnant women. Dr. Butler said, "There are about 2,400 miscarriages a day in the US. You'll see things that would have happened anyway. But the vaccine doesn't cause miscarriages. It also doesn't cause auto accidents, but they happen."[12] I hope that is reassuring to all those expectant mothers across the country, especially since none of the approved H1N1 vaccines have undergone rigorous clinical safety trials on pregnant women or the potential adverse effects of mercury-laced vaccines and other ingredients, such as spermacide, detergent and cosmetics, on the developing fetus. Germany on the other hand announced it is now taking preventative measures. Agreeing that the verdict on ethylmercury and squalene safety for children is unsettled, Germany is requiring the vaccine industry to return to their plants and provide adjuvant- and mercury preservative-free vaccine lots.

McNeil's more recent article in October 7th's *New York Times* should be read alongside the Seven Step Recipe for a clear visual unfolding of the CDC's PR strategy in action. McNeil downplays the growing medical realization that the swine flu is in all likelihood much milder than seasonal flu in order to convince us to roll up our sleeves. Following the CDC script, we see the picture of little 3 year old Clayton being vaccinated, while McNeill compares the swine flu death of an 18 year old Tibetan woman in China with a story of joyful young Brandon and his 9 year old sister gleefully surrendering their nostrils for a blast of live-attenuated H1N1 virus.[13]

While finalizing this article, Peter Doshi replied to an email and drew attention to an event in his *Harper*'s article that should force us to pause before rolling up our sleeves. Briefly, the 2004 flu season was a debacle for the vaccine complex and federal health officials after 50 million doses of flu vaccine promised by Chiron Corporation were made unavailable, therefore, putting the health industry into a panic. In order to lessen the frenzy previously stirred by its public fear tactics, the CDC downgraded the flu's urgency to "an annoying illness", and "stressed the protective benefits of regular hand washing."[14]

Now that is a national policy I can support. I would much prefer the CDC funding Americans' soap bills to ward off an uncertain swine flu pandemic rather than using taxes for unsubstantiated threats from the CDC's national vaccine marketing campaign.

Richard Gale is the Executive Producer of the Progressive Radio Network and a former Senior Research Analyst in the genomic industry. **Dr. Gary Null** is the host of the nation's longest running public radio program on nutrition and natural health and a multi-award-winning director of progressive documentary films, including *Vaccine Nation* and *Autism: Made in the USA*.

CBS NEWS

AP Poll: Only Half of People Want Swine Flu Shots

CBS News, 7 October 2009, 4:11 PM EDT / AP
https://www.cbsnews.com/news/ap-poll-only-half-of-people-want-swine-flu-shots/

The people who most want the swine flu vaccine are older people, who will be last in line, says a new Associated Press-GfK poll.

The survey raises questions about government efforts to stem illnesses already spreading widely across the country.

Vaccine started trickling out this week, but only 52 percent of Americans say they're likely to line up for it, said the poll released Wednesday.

This brand-new flu, what scientists call the 2009 H1N1 strain, is mostly a younger person's infection. Children, young adults and pregnant women are supposed to be first in line for vaccinations.

Yet 62 percent of people 65 and older say they'll likely seek a swine flu shot, even though that older generation appears to have some resistance to the new strain and thus is supposed to wait to be vaccinated until those with a higher risk go first. In contrast, 45 percent of people ages 18 to 29 want to be vaccinated.

And while nearly six in 10 parents are likely to give permission for their children to get swine flu vaccine at school, just 37 percent said they're very likely to. Pollsters have long found that people exaggerate their intent to take recommended health steps, suggesting that how many kids take advantage of the convenience of in-school inoculations may fall somewhere in the middle.

On the other hand, interest in the regular winter flu vaccine is rising: 57 percent of adults want that inoculation, a 9-point increase since the first AP poll on the subject in July.

Concern about swine flu is what's driving the decision to get that vaccine. The AP-GfK poll found 59 percent of people fear getting the new flu strain, and people who are concerned that they or a loved one will get sick are twice as likely to want vaccine.

About 72 percent are concerned about potential vaccine side effects, although half of those people say they're still likely to be inoculated.

The survey of 1,003 adults with cell and landline telephones was conducted from Oct. 1-5. It had a margin of sampling error of plus or minus 3.1 percentage points.

LA VANGUARDIA

Una monja médica hace campaña por internet en contra de que la vacuna contra la gripe A sea obligatoria

La Vanguardia, 7 de octubre de 2009
https://www.lavanguardia.com/vida/20091007/53800182804/una-monja-medica-hace-campana-por-internet-en-contra-de-que-la-vacuna-contra-la-gripe-a-sea-obligato.html

Teresa Forcades, una benedictina doctora en medecina, llama al boicot a la vacunación por considerarlo una imposición innecesaria y que favorece a la industria farmacéutica.

Barcelona.f (EFE).- Teresa Forcades, una monja benedictina doctora en medicina, ha iniciado un movimiento ciudadano en Internet para impedir que la vacuna contra la gripe AH1N1 sea obligatoria debido a la declaración de pandemia por parte de la OMS, y en contra la gestión de la enfermedad.

En un vídeo que ha colgado en la red, la monja hace un llamamiento para activar con carácter urgente los mecanismos legales de participación ciudadana para que no se pueda forzar a nadie en España a ser vacunado, y para que los que lo hagan no se queden sin el derecho a exigir responsabilidades si causa efectos secundarios.

El vídeo explica que desde el año 2005 la Organización Mundial de la Salud (OMS) puede dar órdenes a los gobiernos sobre vacunas en casos de pandemia, y que si esto ocurre el estado tiene la obligación de hacer cumplir la ley imponiendo multa o prisión (en Massachussetts -EEUU- la multa propuesta para este caso podría llegar a los 1.000 dólares por día que pasa sin que te vacunes).

Forcades recuerda que "la gripe nueva" no es nueva porque sea del tipo A, ni tampoco por ser del subtipo H1N1, porque la epidemia de gripe de 1918 fue del tipo A/H1N1 y porque desde 1977 los virus A/H1N1 forman parte de la temporada de gripe de cada año, y puntualiza que lo único que es nuevo es la cepa S-OIV.

Añade que desde que empezó en abril de 2009 y hasta el 15 de septiembre de 2009 han muerto de esta gripe 137 personas en Europa y 3.559 en todo el mundo, cuando debido a la gripe estacional lo hacen entre 40.000 y 220.000 personas, lo que supone que la tasa de mortalidad y de complicaciones es inferior a la de cada año.

La religiosa denuncia además irregularidades en la elaboración de la vacuna y explica cómo en enero del 2009 la filial austríaca de la farmacéutica Baxter distribuyó a 16 laboratorios de Austria, Alemania, la República Checa y Eslovenia 72 kilos de material para hacer miles de vacunas contra la gripe estacional, que resultó contener virus vivos de la gripe aviar (virus A/H5N1) con virus vivos de la gripe de cada año (virus A/H3N2).

El descubrimiento se hizo cuando un técnico de laboratorio de la empresa BioTest de la República Checa probó por su cuenta las vacunas en hurones, animales que se usan para estudiar las vacunas de la gripe, y comprobar que todos ellos murieron.

Explica que si esta contaminación no se hubiese descubierto a tiempo, la pandemia que sin base real están anunciando las autoridades de la OMS y los países "sería una espantosa realidad", porque sería letal combinar un virus con un 60% de mortalidad pero poco contagioso como el aviar, con otro con baja mortalidad pero gran capacidad de contagio, como el de la gripe estacional.

También cuenta cómo sólo 12 días después de aparecer los primeros casos, la OMS declaró que el nivel de alerta por peligro de pandemia estaba en fase 5 y ordenó a los gobiernos que activasen planes de emergencia, y un mes después declaró que ya había una pandemia, cuando la nueva gripe es más benigna que la estacional.

La médico relata que esta declaración de pandemia (fase 6) fue posible porque en mayo la OMS cambió la definición de pandemia. Antes para poder hacerlo era necesario que muriese a causa de un agente infeccioso una proporción significativa de la población, un requerimiento que fue eliminado de la definición.

Sobre la vacuna, la religiosa alerta de que la mayoría de los laboratorios diseñan vacunas en dos dosis, que deben sumarse a la vacuna de gripe estacional, algo que nunca se ha hecho y que multiplica por tres los posibles efectos secundarios.

También revela que los laboratorios que hacen vacunas usan coadyuvantes muy potentes para estimular el sistema inmunitario, y que la que está fabricando Glaxo-Smith-Kline contiene uno llamado AS03, que multiplica por diez la respuesta inmunitaria, que podría provocar enfermedades auto inmunitarias graves al cabo de un tiempo.

Además hace público que las farmacéuticas que fabrican la vacuna están exigiendo a los estados que firmen acuerdos de inmunidad para que en caso de que las vacunas tengan más efectos secundarios de los previstos, los políticos y la industria quede exenta de toda responsabilidad. Teresa Forcada es autora de "Los crímenes de las grandes compañías farmacéuticas", en donde explica cómo el poder político y económico que han adquirido les sirve para garantiza unos enormes beneficios económicos, aún a costa de la salud de la población.

Iglesia Descalza

Iglesia Descalza

A nun speaks out on the H1N1 Pandemic

Gaspar Hernández

(translation by Rebel Girl)
El Periódico de Catalunya, 7 October 2009
https://web.archive.org/web/20091021032743/http://iglesiadescalza.blogspot.com/2009/10/nun-speaks-out-on-h1n1-pandemic.html

What's a nun doing talking on the Internet about the dangers of the Influenza A vaccine?
Our rule prescribes five hours of prayer and six of work. Ora et labora.
...

I devote part of the working hours to medical research. I'm a doctor of medicine and in 2006 I published the study Crimes and Abuses of the Pharmaceutical Industry.
=> See: https://archive.org/details/forcades-crimes-abuses

When did you decide you had to speak out on influenza A?
In May this year I was asked to give a speech on the papillomavirus vaccine and I was very struck by the lack of scientific basis for the official recommendations. After a few days I spoke on TV-3 about this vaccine and since then I have been receiving requests to comment on the influenza A vaccine.

Doesn't the World Health Organization deserve to be trusted?
I don't understand the motives that have led WHO to act in the absurd way it is acting.

Absurd?
Yes. Last May, WHO changed the official definition of a pandemic -- it changed from a logical definition (a pandemic is an infection of global proportions and with a high mortality) to an illogical definition (a pandemic is an infection of global proportions).

What are the consequences of this change?
Under the new definition of "pandemic", the annual [seasonal] flu more than meets the requirements to be one. Are we going to declare a world health alert every fall? Besides absurdity from the scientific standpoint, this has serious financial and policy consequences.

You don't trust the vaccine. Why?
Unlike the annual seasonal flu vaccine, the influenza vaccine contains such powerful adjuvant substances that they can get the normal immune response to multiply by a factor of 10. In addition, two doses are recommended, to be received after the injection for seasonal influenza, which also contains adjuvants, although less potent. Never before have these substances been injected three times in a row in the general population, starting with children, the chronically ill and pregnant women.

What effects can result?
The artificial stimulation of the immune system can cause autoimmune diseases.

?

The same prospect of two of the influenza vaccines that have already been approved in Europe (Pandemrix and Focetra) indicates that it is expected that for every million people vaccinated, 99 will experience an autoimmune disease known as Guillain-Barré progressive paralysis.

If that happens, the drug companies would receive demands...

But in the U.S. a decree has already been approved exempting politicians and drug companies from liability.

Are you suggesting that the drug companies have acted irresponsibly?

What they have done is work for their interests.

Can someone be obliged to get vaccinated?

In 2007, WHO adopted a regulation establishing an exception. In all cases except one, the WHO makes recommendations, and only in one case may it give orders that override the sovereignty of member countries.

In the case of a pandemic.

Exactly. In 2007, WHO adopted a regulation that in case of a pandemic, WHO can legally bind member countries to vaccinate all or part of their population. The governments of these countries would be obliged then to impose fines or other penalties for individuals who refuse to be vaccinated.

Do you believe in world conspiracies?

I think there are interests at stake are not the good of the population. How can we justify the money invested in the purchase of vaccines if influenza A is milder than the annual seasonal flu? Spending so much money on vaccines and other preventive measures without sufficient scientific basis is an outrage and we should ask for accountability.

What do your fellow nuns say about the video and your statements?

An almost 90 year old sister raised the objection that the subject of influenza A is very serious and that I couldn't speak out against the vaccine without having well-founded arguments.

And?

After reading my report, she approached me after vespers and simply said to me: "Understood."

Aren't you afraid?

Sometimes.

Do you pray a lot?

As much as I can.

A nun speaks out on the H1N1 Pandemic

Iglesia Descalza Blogspot

https://web.archive.org/web/20091021032743/http://iglesiadescalza.blogspot.com/2009/10/nun-speaks-out-on-h1n1-pandemic.html

Sr. Teresa Forcades i Vila has taken off her theologian's hat and gone back to her doctor in public health role to address the influenza A (H1N1) pandemic in a new video (see below) that calls for a calm approach to the disease and emphasizes the right of citizens to refuse to be vaccinated against it.

Sr. Theresa also has a new blog space on catalunyareligió.cat in which she is sharing her writings on the flu and other issues.

THE CANADIAN PRESS

Helen Branswell

Canadians don't see H1N1 as a personal risk, only one-third plan to take shot

The Canadian Press, 8 October 2009
https://www.winnipegfreepress.com/arts-and-life/life/home-family/2009/10/08/canadians-don_t-see-h1n1-as-a-personal-risk_-only-one-third-plan-to-take-shot

Toronto - Canadians don't seem to see the H1N1 virus as a personal threat, and few currently plan to get vaccinated against the virus, a new poll indicates.

The Canadian Press Harris-Decima poll suggests interest in the swine flu vaccine has declined in Canada, with only a third of people now saying they will get the shot, compared to 45 per cent in late August.

"I think that that's a significant decline. And it indicates ... either a higher level of confusion over what the right approach is, or a lower sense of risk," Doug Anderson, senior vice-president at Harris-Decima, said last week.

Ironically the poll findings come at a time when the federal government is under intense pressure to fast-track approval of the H1N1 vaccine so that immunization efforts can begin sooner than the projected early November launch. Canada has purchased 50.4 million doses of the pandemic vaccine.

"They're certainly disappointing and maybe a bit dismaying," Dr. Perry Kendall, British Columbia's chief medical officer of health, said of the findings.

Kendall said a national public awareness campaign will be launched to try to improve understanding of the benefits of the vaccine and to persuade people the product is safe, effective and in their best interest to take.

"At the end of the day I rather suspect that it will depend on people's perceptions of risk," he said of the likely uptake.

The poll, conducted from Oct. 1 to 5, suggests at this point people don't believe this virus will have much impact on their lives. Only 11 per cent of people described themselves as very concerned about H1N1, and 25 per cent said they were somewhat concerned. Nearly two-thirds of people said they either were not very concerned or weren't concerned at all about H1N1

Three-quarters of Canadians surveyed felt they would be exposed to seasonal flu this winter, but only 45 per cent felt they would be exposed to the pandemic virus.

Only five per cent of respondents felt they were very likely to contract swine flu, and 72 per cent felt they were not that likely or not likely at all to get infected with the new virus. In contrast, 18 per cent felt they were very likely to get sick with seasonal flu.

The apparent belief that seasonal flu poses a greater risk at this point than the pandemic virus flies in the face of the virological reports of what flu viruses are circulating in the world at this point.

While they haven't disappeared altogether - and while no one can predict what the winter will bring - there has been limited seasonal flu activity globally since the emergence of the new virus earlier this year.

"I think it speaks to the fact that although the media have been accused of hyping this (H1N1), clearly the message that seems to have gotten through is people ... don't see it as a threat," said Dr. Michael Gardam, director of infectious diseases prevention and control at the Ontario Agency for Health Protection and Promotion.

"It would be far easier to go down this road if it was a more virulent virus. And I'm not wishing that it's a more virulent virus. That's one of the reasons why it's got us in this weird sort of pickle."

The poll suggests half of people don't plan to get any flu shot at all this year. Of the 50 per cent who do, 27 per cent said they would get both seasonal and pandemic flu shots. In total, 33 per cent indicated they would get an H1N1 shot and 36 per cent said they'd get a seasonal flu shot.

Those numbers actually align pretty closely with the percentage of the population that rolls up its sleeve for flu shots in regular years - further proof, Gardam said, that suggests people don't see the pandemic virus as a greater-than-normal threat at this point.

"They look at it as sort of same-old same-old. And the majority of people don't get vaccinated for seasonal flu, so why would they change now?"

Dr. Kumanan Wilson, a public health researcher at the Ottawa Hospital Research Institute, said the findings illustrate that the public is confused about the various viruses and the two vaccines.

"This isn't easy to understand," he admitted.

"There's a lot of confusion about how worried they should be about both the seasonal flu and H1N1. And I think the message from this is that these are the questions that public health officials need to answer."

Relaxation Santé [MC]

Jane Burgermeister

Génocide de la vaccination

Relaxation Santé, 8 octobre 2009
http://relaxation-sante.com/info_sante.html

Jane Burgermeister a récemment déposé une plainte contre l'OMS (Organisation Mondiale de la Santé), l'ONU, Barack Obama (Président des Etat-Unis), David de Rothschild (banquier), David Rockefeller (banquier), George Soros (banquier), Werner Faymann (Chancelier d'Autriche) 1, entre autres, les accusant de vouloir commettre un génocide de masse.

Cette plainte fait suite à une autre procédure judiciaire que la journaliste avait intentée en avril 2009 contre les sociétés pharmaceutiques Baxter et Avir Green Hills Technology, qu'elle juge responsable d'avoir produit un vaccin contre la grippe aviaire, pour délibérément provoquer une pandémie et s'enrichir par la même occasion.

Jane Burgermeister présente les preuves d'actes de bioterrorisme dans lesquels ces personnes et organismes précités sont impliqués. Elle les accuse de faire partie d'un syndicat international d'entreprises criminelles qui a mis au point, fabriqué, stocké et utilisé des armes biologiques en vue d'éliminer la population des États-Unis et celle d'autres pays 2, à des fins de gains politiques et financiers.

Utilisant la «grippe porcine» comme prétexte, elle les accuse d'avoir planifié le meurtre de masse de la population américaine par le biais de la vaccination forcée. Elle a les preuves que ces vaccins seront volontairement contaminés pour provoquer à dessein des maladies mortelles.

Ces exactions s'inscrivent en violation directe de la Loi antiterroriste concernant l'emploi d'armes biotechnologiques. Elles constituent des actes de terrorisme et de haute trahison.

Jane Burgermeister. Vaccination genocide

Austrian investigative journalist Jane Burgermeister has filed criminal charges against the World Health Organization (WHO), the United Nations (UN), and several of the highest ranking government and corporate officials, charging them with bioterrorism and attempts to commit genocide.

In April, she filed charges against Baxter AG and Avir Green Hills Biotechnology of Austria for producing and releasing live bird flu virus', alleging it was a deliberate act to cause and profit from a pandemic.

When a Czech scientist tested their seasonal flu vaccine, he found that they contained live H5N1 and live H3N2 viruses. Burgermeister's charges include evidence that Baxter deliberately sent out 72 kilos of live bird flu virus, supplied by the WHO in the winter of 2009.

She claims to have decisive proof that drug companies and government agencies are actively engaged in distributing deadly biological agents in order to trigger a pandemic.

She has also prepared an injunction against forced vaccination, alleging mandatory vaccines will be purposely contaminated with diseases.

Poll: Third of Parents Oppose H1N1 Vaccine
Demand Remains High

CBS-2, 8 October 2009, 1:45 pm US/Eastern
https://web.archive.org/web/20091015134117/http://wcbstv.com/national/h1n1.swine.flu.2.1235591.html

Atlanta (AP) – As the first wave of swine flu vaccine crosses the country, more than a third of parents don't want their kids vaccinated, according to an Associated Press-GfK poll.

Some parents say they are concerned about side effects from the new vaccine - even though nothing serious has turned up in tests so far - while others say swine flu doesn't amount to any greater health threat than seasonal flu.

Jackie Shea of Newtown, Conn., the mother of a 5-year-old boy named Emmett, says the vaccine is too new and too untested.

"I will not be first in line in October to get him vaccinated," she said in an interview last month. "We're talking about putting an unknown into him. I can't do that."

The AP poll found that 38 percent of parents said they were unlikely to give permission for their kids to be vaccinated at school.

The belief that the new vaccine could be risky is one federal health officials have been fighting from the start, and they plan an unprecedented system of monitoring for side effects.

They note that swine flu vaccine is made the same way as seasonal flu vaccines that have been used for years. And no scary side effects have turned up in tests on volunteers, including children.

On Wednesday, Health and Human Services Secretary Kathleen Sebelius appealed for widespread inoculation against swine flu, vouching unconditionally for the vaccine: "We know it's safe and secure."

The AP poll, conducted Oct. 1-5, found 72 percent of those surveyed are worried about side effects, although more than half say that wouldn't stop them from getting the vaccine to protect their kids from the new flu.

Giving flu shots to schoolchildren is also an idea many parents are still getting used to. It was only last year that the government recommendation kicked in for virtually all children to get it. Seasonal flu vaccination rates for children last year ranged from about 48 percent for toddlers to about 9 percent for teens.

It traditionally takes a while for parents to learn about and accept a new vaccine and years for immunization rates to grow, said Dr. Matthew Davis, a University of Michigan Medical School associate professor who has overseen polling on flu issues.

Special swine flu vaccination clinics at schools are being planned in many states. Children are the main spreaders of infectious disease, and if large numbers are coming down with swine flu, there are ripple effects for everyone else.

The AP poll found 59 percent are likely to let their kids be vaccinated at school. But the kind of concerns voiced by parents could put a dent in public health efforts.

A survey Davis directed for C.S. Mott Children's Hospital in Michigan suggested one reason for rejecting the vaccine is that about half of parents said they did not consider swine flu any worse than the seasonal bug.

"Basically, the swine flu is the flu. I'm not overly excited about it," said Julie Uehlein, a Tullahoma, Tenn., mother who is against swine flu vaccinations for her 8-year-old son and 3-year-old daughter.

"My concerns about the vaccine are what are the long-term effects," she added.

Some, like Shea, recall the 1976 swine flu immunization campaign that vaccinated 40 million Americans against an epidemic that never materialized. Worse, many who got the shots back then filed injury claims blaming health problems on the vaccine, with some reporting a paralyzing condition called Guillain-Barre syndrome.

Health officials did not find evidence the vaccine caused the condition, noting it occurs naturally anyway and would be bound to show up in such a large group. Many people were unjustifiably blaming all sorts of health problems on the vaccine, some health experts believe.

That's why the government is already trying to educate people about how common many health problems are, and why it's handing out cards telling people how to report any side effects.

For some parents, fears are compounded by worries about thimerosal, a mercury-based preservative that will be in roughly 60 percent of the 225 million swine flu doses ordered for Americans.

The preservative is not in the FluMist nasal spray, which can be given to healthy kids age 2 and older. But it's in many injectable doses, which are packaged in multi-dose vials that require thimerosal to prevent bacterial contamination.

Fears that the preservative or something in vaccines themselves can lead to autism remain entrenched in some quarters - despite no evidence from the most rigorous scientific studies.

Some autism advocacy groups echo parents' concerns about swine flu vaccine, and also argue it's a bad idea to spend so much time and money on the new flu.

"We're flipping out over swine flu, but it's only affected a few thousand people. Why isn't somebody freaking out about the autism epidemic?" said Wendy Fournier, president of the National Autism Association.

Vaccine makers are sensitive to demand for preservative-free shots. Parents can ask their doctors to order preservative-free, single-dose vaccine for their kids, said Dr. Tom Frieden, head of the Centers of Disease Control and Prevention.

As for his own two school-age children, Frieden said in a recent interview: "I would have no hesitation about getting my kids vaccinated by thimerosal-containing vaccines."

Health officials and many parents are strong believers in the vaccine, and warn about the potential dangers of a virus that has caused at least 9,000 U.S. hospitalizations and at least 600 deaths, including 60 children.

Jennifer Barnes enrolled herself and her two children in one of the government studies of the new vaccine, seizing an opportunity to get them all immunized before the illness became widespread.

"I thought, 'This is an opportunity to get the kids vaccinated, and I better jump on it,'" said Barnes, 32, a speech language pathologist who lives in Decatur, Ga.

Barnes said she gets her kids vaccinated against flu each year not only for their own health but to protect others. "My kids hang around kids who might have lowered immune systems. I would hate for them to get something and pass it on," she said.

Shea said she appreciates those arguments, but she's hesitated to talk about swine flu vaccine with other parents, who seem polarized on the topic. "There's the crunchy granola group" against flu vaccinations, she said, "and the very staunch, follow everything group" who extol them.

She also worries that swine flu could become more widespread and dangerous than it is now. If that happens, she said, she would probably try to get her son vaccinated, though she's aware there are risks in waiting, too.

"It's one of those things where you're almost damned if you do, damned if you don't," she said.

The AP-GfK poll was based on a nationally representative sample of 1,003 adults age 18 or older, contacted by telephone on land lines and cell phones. The margin of sampling error is plus or minus 3.1 percentage points for all adults, 5.2 percentage points for parents.

Swine flu shot - lives endangered?

While Congress debates the pros and cons of healthcare reform, the average U.S. citizen is facing a more urgent dilemma - to get a swine flu shot, or not? When it comes to gambling on health, some people opt for 'thanks, but no thanks'. RT's Priya Sridhar talks about the heated debate on vaccine safety with Barbara Loe Fisher, President of National vaccine information centre.

MIT grad shows CDC mind-behavior control duping doctors and public to buy vaccine

Examiner, 10 October 2009, 2:47 AM
https://web.archive.org/web/20100416063851/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m10d10-Mindbehavior-control-dupes-doctors-and-public-to-buy-vaccine

Buyer beware

The Center for Disease Control (CDC) officials are almost ready for their PR company to unleash a sophisticated, powerful H1N1 'swine flu' vaccine multimedia marketing campaign to dupe doctors and exploit society's most vulnerable through what social scientists call mind control that aims for behavior control. In this case, the desired behavior is to accept a toxic spray or injection by obediently obeying the mind control marketing ploy, even against personal better judgment.

Richard Gale and Dr. Gary Null reported today that Peter Doshi first brought public attention to a CDC public relations influenza strategy known as the Seven Step Recipe.
See: http://www.whale.to/vaccine/nullcdc.html

Gale and Null's report highlights that while at Harvard in the mid-2000s, Peter Doshi published a study in the *British Medical Journal,* systematically unveiling a flawed predictive science to publicize health agencies' influenza statistics and mortality rates.

"His analysis shook up enough health authorities to warrant twelve scientists from the CDC and National Institutes of Health to unsuccessfully take him on," according to Gale and Null. Their report states:

Now at MIT, Doshi continues his analysis of a century's worth of influenza mortality data and government manipulation of influenza data, such as the annual figure of 36,000 influenza deaths we hear and read repeatedly. See: Doshi, Peter, *Viral Marketing: The Selling of the Flu Vaccine, Harpers Magazine*, March 2006. => https://harpers.org/archive/2006/03/viral-marketing/

Although this magical number was for all practical purposes alchemically conjured up via mathematical modeling back in 2003, it continues to be the most holy number in the CDC's PR vocabulary every flu season.

Doshi draws the conclusion, published in the American Journal of Public Health, that commercial interests are playing the role of science in both industry and government. (*MIT grad student's study challenges notions of pandemic flu*, MIT Tech Talk, April 16, 2008). => https://web.archive.org/web/20090102224406/http://web.mit.edu/newsoffice/2008/techtalk52-23.pdf

Rather than accepting the official version that vaccinations decreased influenza, "Doshi calculated an 18-fold decrease in influenza deaths between the 1940s and 1990s, **a trend that began far before the introduction of widespread vaccination.**" (MIT News, *Study challenges notion of 'pandemic' flu CDC-labeled pandemics no deadlier than seasonal flu*, April 11, 2008). => https://web.archive.org/web/20090502140838/http://web.mit.edu/newsoffice/2008/pandemic-0411.html

CDC 7-Step Spin to exploit public

Gale and Null report that Glen Nowak, Director of the CDC's Media Relations, outlined a concise public relations template as communications spokesperson for the National Immunization Program.

At the 2004 National Influenza Vaccine Summit, Nowak presented the CDC 7-step PR campaign in a Powerpoint presentation in which Null and Gale discovered a very detailed and concerted PR and multimedia campaign that includes the following with quotes from CDC's materials:

• *To encourage the belief* that influenza infection can 'occur among people for whom influenza is not generally perceived to cause serious complications (e.g., children, healthy adults, healthy seniors).' In other words, promote flu vaccination to those who don't really need it.

• In order to 'foster the demand for flu vaccinations' the CDC should *target 'medical experts and public health authorities publicly* (e.g., via media) [to] state concern and alarm (and predict dire outcomes) – and urge influenza vaccination.'

• *By focusing on the message* of dire health threats and human casualties upon those who don't really need to be vaccinated, the CDC will reach its milestone of "framing of the flu season in terms that motivate behavior (e.g., as 'very severe,' 'more severe than last or past years,' 'deadly')."

• Throughout the flu season, the campaign would *continue issuing reports* 'from health officials and media' to emphasize that 'influenza is causing severe illness and/or affecting lots of people – helping foster the perception that many people are susceptible to a bad case of influenza.'

• Of course, no marketing strategy is thorough without images. Ergo another ingredient in the recipe is to use 'visible/tangible examples of the seriousness of the illness (e.g., *pictures of children*, *families of those affected* coming forward) and people getting vaccinated (the first to motivate, the latter to reinforce).'

Now in critical mind-behavior control spin timeframe

The CDC's 'key points' indicate that we are now in that critical timeframe for the CDC to distribute materials to "a variety of partners.'

"This includes aggressively disseminating all medical reports, studies and PR spins to the soporific media and corporate-funded medical associations to support the government's mass vaccination efforts," according to Null and Gale who predict:

"Come *November, we will begin to see reports on 'pediatric deaths' due to influenza* – although Dr. Martin Meltzer, a CDC expert in health economics, has stated 'almost nobody dies of the flu' and 'deaths [are] associated with flu, but not necessarily caused by flu.'

(Manning, Anita. *Study: Annual flu death toll could be overstated*, USA Today. December 11, 2005) => https://tacanow.org/enewsletters_archive/2005/December_2005_2.htm

Richard Gale is Executive Producer of the Progressive Radio Network and a former Senior Research Analyst in the genomic industry.

Dr. **Gary Null** hosts the nation's longest running public radio program on nutrition and natural health and is a multi-award-winning director of progressive documentary films, including *Vaccine Nation and Autism: Made in USA.*

La Voz de Galicia

Una monja inicia una campaña contra la vacuna de la gripe A

La Voz de Galicia, 10 Octobre 2009, 00:36 h
https://www.lavozdegalicia.es/noticia/sociedad/2009/10/09/monja-inicia-campana-contra-vacuna-gripe/00031255105545944982623.htm

La religiosa Teresa Forcades ha divulgado masivamente un vídeo en el que advierte sobre los riesgos de la vacuna.

Se llama Teresa Forcades y está en el ojo del huracán por un vídeo que ha colgado en Internet. Es una monja benedictina de origen catalán que ha iniciado un movimiento ciudadano cuyo objetivo es evitar que la vacuna contra la nueva gripe sea obligatoria.

La religiosa advierte en un vídeo, que se está descargando de manera masiva, sobre los riesgos y efectos secundarios de la vacuna.

La monja, que también es doctora en Medicina, es autora de un libro titulado *Los crímenes de las grandes compañías farmacéuticas*, en el que denuncia la forma en la que el poder político de las grandes farmacéuticas es utilizado para obtener enormes beneficios económicos a costa de la salud pública.

Forcades publica en su blog un extenso comunicado en el explica que, en enero del 2009, la filial austríaca de Baxter distribuyó a 16 laboratorios de Austria, Alemania, la Republica Checa y Eslovenia, 72 kilogramos de material para preparar miles de vacunas contra la gripe estacional.

Estas vacunas, que serían administradas entre febrero y marzo, «fueron probadas en hurones que murieron tras recibirla». Según la religiosa, después de una intensa investigación, se concluyó que la vacuna de la casa Baxter contenía virus vivos de la gripe aviar (virus A/H5N1) combinados con virus vivos de la gripe de cada año (virus A/H3N2).

«Si esta contaminación no se hubiese descubierto a tiempo, la pandemia que sin base real están anunciando las autoridades sanitarias globales (OMS) y nacionales, ahora sería una espantosa realidad», asegura Forcades quien añade que «esta combinación de virus vivos puede ser especialmente letal porque combina un virus que tiene un 60% de mortalidad pero es poco contagioso (el virus de la gripe aviar) con otro que tiene una mortalidad muy baja pero con una gran capacidad de contagio (un virus de los de la gripe de cada año)».

Forcades explica en su vídeo que «la nueva gripe» no es nueva porque sea del tipo A, ni tampoco por ser del subtipo H1N1, sino que «lo único que es nuevo es pertenecer a la cepa S-OIV».

Según la benedictina, la epidemia de gripe de 1918 fue también del tipo A(H1N1) y asegura que, desde 1977, este tipo de virus forma parte de la temporada de gripe estacional.

En su vídeo, la monja destaca que profesionales de la salud como el Bernard Debré, del Comité de Ética de Francia y Juan josé Rodríguez Sendí, que preside la Asociación de Colegios Médicos de

España, coinciden en que la tasa de mortalidad de la gripe A es inferior a la estacional, por lo que las alarma mundial que existe en varios países es innecesaria.

Destaca también que desde que empezó a detectarse esta enfermedad en abril de 2009 y hasta el 15 de septiembre de 2009 han muerto 137 personas en Europa y 3.559 en todo el mundo, cuando debido a la gripe estacional fallecen entre 40.000 y 220.000 personas.

Entre sus múltiples advertencias la religiosa señala que los laboratorios han diseñado la nueva vacuna en dos dosis que deben sumarse a la vacuna de la gripe estgacional, lo que triplica los posibles efectos secundarios como la parálisis de Guillain-Barré.

Además, las empresas farmacéuticas, según esta monja, están exigiendo a todos los países que firmen acuerdos de inmunidad para que en caso de que las vacunas tengan más efectos secundarios de los previstos, la industria quede exenta de toda responsabilidad.

«Hago un llamamiento a activar los mecanismos legales necesarios para asegurar de forma rotunda que no se podrá forzar a nadie en nuestro país a ser vacunado en contra de su voluntad, y que los que decidan vacunarse no serán privados del derecho a exigir responsabilidades ni del derecho a ser compensados económicamente (ellos o sus familiares) en caso que la vacuna les cause una enfermedad grave o la muerte», concluye el polémico comunicado de Forcade.

THE FLU CASE

German protests over toxic swine flu jab grow after army rejects it as too risky.

NetZeitung, 12 Oktobre 2009, 16:31
The Flu Case , 13 October 2009 12:09
https://web.archive.org/web/20091019055638/http://www.theflucase.com/index.php?option=com_content&view=article&id=1011:german-protests-over-toxic-swine-flu-jab-grow-after-army-rejects-it-as-too-risky-&catid=41:highlighted-news&Itemid=105&lang=en

The protest against German government plans to mass vaccinate the population with the untested and toxic swine flu jab are growing after the German army decided to order a jab without heavy metals mercury and without adjuvants that is made in the same way as the regular flu shots.

Virologost Alexander Kekule from the University of Halle accused the government on TV of ordering the wrong "vaccines" against the swine flu for the population, noting that the adjuvants cause serious side effects.

Kekule said the use of adjuvants should be abandoned. However, experts say there are still dangerous amounts of mercury in the vaccine -- 50ug or 25,000 times what the FDA considers safe in food, - and live viruses in the jab, which will be especially harmful for children and pregnant women.

In addition, there is evidence that there will be nanochips in the vaccines which store health insurance information and are linked to a WHO/UN supercomputer, allowing the WHO/UN to track the population.

Paul-Ehrlich-Instituts (PEI) spokesperson, Susanne Stöcker, defended the jab saying it was "basically the same and that it fulfilled all EU criteria," omitting to mention the EU's regulatory body, the EMEA; itself has said that the safety and efficacy of the "swine flu" jab do not have to be proven to be approved under emergency guidelines and that there is no data on how this new flu jab using illegal adjuvants will impact on pregnant women or children.

THE FLU CASE

German army gives health ministry "slap in the face" but "only right decision", says German virologist

The Flu Case, 13 October 2009 17:54

https://web.archive.org/web/20091017033106/http://www.theflucase.com/index.php?option=com_content&view=article&id=1020:german-army-gives-health-ministry-qslap-in-the-faceq-but-qonly-right-decisionq-says-german-virologist&catid=41:highlighted-news&Itemid=105&lang=en

German army health officials have ignited a fierce debate about the dangers of the "swine flu" vaccine by announcing on Monday that its soldiers are going to be given a completely different swine flu vaccine than the one ordered for the army by the German health ministry.

Virologist Alexander Kekule, head of the department of medical microbiology at Halle University, said that the army had "given a slap in the face to the health ministry" but had "made the only right decision" by deciding to give its 250,000 active duty soldiers a jab without mercury, without squalene and also with an inactivated virus.

The army "doctors and advisors were simply more clever," he said in the German mainstream newspaper Die Welt.

The announcement by the army has increased the pressure on the German health ministry to explain why the rest of the people in the country are expected to take the untested and unproven "swine flu" jabs with mercury, adjuvants as well as a live virus in a campaign starting on October 26th.

German Health Minister Ulla Schmidt tried to play down the significance of the army's decision by insisting there were three different swine flu jabs on the market and suggesting the army had just happened to chose the one without mercury and adjuvants.

However, it is accurate to say that there were three different manufacturers – Novartis, GSK and Baxter - providing the same standard swine flu jab with mercury and adjuvants on the market until the army, other German health officials and doctors insisted on having a jab without the dangerous preservatives and additives.

It appears that Baxter – the company compromised by having been caught trying to trigger a bird flu pandemic this february in Austria by contaminating 72 kilos of vaccine material with the live bird flu virus – has been sacrificed by WHO and the pharmacuetical companies that sit on its key vaccine boards and given the green light to switch over to produce a "harmless" vaccine without mercury and adjuvants to save face and also possibly ensure that nanochips -- widely believed to be in the jab – are implanted into as many people as possible.

The army's unexpected decision is fuelling uneasiness about the mass "swine flu" vaccination campaign due to start in Germany on October 26th.

Theodor Windhorst, the president of the chamber of doctors of Westfalen-Lippe, has said that the swine flu jab is associated with "significant risks."

The number of leading doctors calling for swine flu jabs without adjuvants to be given to women and children has been steadily growing.

Pregnant women, children and health care workers are among the target groups selected by the German health minister Ulla Schmidt, following the instructions of WHO, to be among the first to get the swine flu jab even though there is no clinical data on the adjuvant squalene in pregnant women or children.

Under growing pressure, however, Schmidt this week said that pregnant women will now be advised to take the jab without the adjuvant, squalene, which is to be added at the last moment to form a toxic mix.

Squalene is illegal in the USA and UK, and there is evidence it caused tthe Gulf War Syndrome which afflicted 25 per cent of the US and UK soldiers who took the anthrax vaccine, even though that vaccine had a million times less squalene than the "swine flu" jab.

German army health officials said that it was not clear how the "swine flu" jab would interact with the other vaccines German soldiers have to take, especially if they are sent on overseas missions and also what the impact of the accumulation of toxic heavy metals might be.

"We are not something better, but something different," said an army spokesperson.

However, there are growing numbers of people in Germany wondering why they are expected to take a "swine flu" jab by the Health Ministry that is considered to dangerous for the army.

The decision by the German army to abandon the "swine flu" jab also raises the question of why other country’s army leaderships are not open to feedback on the jabs dangers, and willing to asess new information and correct their vaccination plans.

The US and UK army already have a large body of evidence that the anthrax vaccine caused significant auto immune diseases in its soldiers, and yet these armies appear to be pushing ahead with ist campaign to force every soldier to take the dangerous jab.

The decision by the top level US military to impelment the mass vaccination campaign of US soldiers at bases at top speed will fuel fears that the US army, in particular, has been taken over by agents working for the "the banking elite," who control the WHO and UN and who appear to be actively attempting to destroy the US army in order to pave the way for the occupation of America by UN soldiers and foreign mercenary troops in a "New World Order".

US army leaders who have raised questions about the mismanaged campaigns in Afghanistan and Iraq – triggered by the false flag 9/11 attack – have been silenced or forced to resign, leaving the military top heavy with government "yes" men.

The decision by the German army to refuse the "swine flu" jab is a significant blow to plans of the WHO and UN to carry through a synchronised and swift mass vaccination campaign across the USA and EU using bioweapons under the cover of a "vaccine" to accomplish their objective of depopulation and conquest.

Crucial to accomplishing their aim of world domination under a WHO/UN/IMF government is maintaining control of a country’s military and law enforcement, at least, long enough to use them to destroy the civilian population by vaccination and quarantines.

The next step would require the army and police, having done ist job, to be destroyed in turn by disease or by igniting fresh wars.

There has been speculation that soldiers and police might be given a vaccine with a disease that can be triggered by chemicals in water or some other means, allowing the disease to be activated at some preplanned point later on.

The danger now facing the "WHO/UN" bankster cartel is that other armies will refuse the swine flu jab – and that civilian populations will follow suit and demand a proper investigation in the "swine flu" scam, a move that will surely result in large numbers of arrests.

Without a significant "culling of the population" and the installation of a comprehensive, electronic surveillance system using nano chips, the WHO/UN cartel will find it difficult to maintain control of their synchronised and coordinated programme to depopulate the world and set up a one world govenrment with the calculated use of economic collapse, war and famine as well as the establishment of a totalitarian state to crush opposition and shut down the internet.

YAHOO! DEUTSCHLAND NACHRICHTEN

Virologe: Bundesregierung hat den falschen Impfstoff gekauft

Yahoo Deutschland, DDP, 13 Oktobre 2009; 15:55 Uhr
https://web.archive.org/web/20091013215024/http://de.news.yahoo.com/17/20091012/thl-virologe-bundesregierung-hat-den-fal-3f611bb.html

Halle (ddp-lsa). Der Virologe Alexander Kekulé wirft der Bundesregierung vor, den falschen Impfstoff gegen die Schweinegrippe eingekauft zu haben. Der Hallenser Universitätsprofessor sagte dem Sender MDR info am Montag in Halle, dieser Impfstoff enthalte einen Wirkungsverstärker mit erheblichen Nebenwirkungen. Damit werde gewissermaßen mit Kanonen auf Spatzen geschossen.

Viel geeigneter ist nach Ansicht Kekulés der Impfstoff, für den sich die Bundeswehr entschieden hat. Dieser werde auch in den USA und anderen Teilen der Welt eingesetzt. Er habe keinen Wirkungsverstärker und funktioniere genauso wie der normale saisonale Grippe-Impfstoff. Der Vorteil dieses klassischen Serums sei, dass es sich schon milliardenfach bewährt habe. Man könne aber die Situation noch retten, indem man bei dem bereits bestellten Mittel den Verstärker einfach weglasse. Dafür sei eine besondere Zulassung nötig.

THE FLU CASE

German protests over toxic swine flu jab grow after army rejects it as too risky

The Flu Case, 13 October 2009
https://web.archive.org/web/20091013215024/http://de.news.yahoo.com/17/20091012/thl-virologe-bundesregierung-hat-den-fal-3f611bb.html

The protest against German government plans to mass vaccinate the population with the untested and toxic swine flu jab are growing after the German army decided to order a jab without heavy metals mercury and without adjuvants that is made in the same way as the regular flu shots.

Virologost Alexander Kekule from the University of Halle accused the government on TV of ordering the wrong "vaccines" against the swine flu for the population, noting that the adjuvants cause serious side effects.

Kekule said the use of adjuvants should be abandoned. However, experts say there are still dangerous amounts of mercury in the vaccine -- 50ug or 25,000 times what the FDA considers safe in food - , and live viruses in the jab, which will be especially harmful for children and pregnant women.

In addition, there is evidence that there will be nanochips in the vaccines which store health insurance information and are linked to a WHO/UN supercomputer, allowing the WHO/UN to track the population.

Paul-Ehrlich-Instituts (PEI) spokesperson, Susanne Stöcker, defended the jab saying it was "basically the same and that it fulfilled all EU criteria," omitting to mention the EU's regulatory body, the EMEA; itself has said that the safety and efficacy of the "swine flu" jab do not have to be proven to be approved under emergency guidelines and that there is no data on how this new flu jab using illegal adjuvants will impact on pregnant women or children.

NewScientist

Debora MacKenzie

Swine flu vaccine shunned despite availability

New Scientist, 13 October 2009, 17:47
https://web.archive.org/web/20091017133441/http://www.newscientist.com/article/dn17975-swine-flu-vaccine-shunned-despite-availability.html?full=true&print=true

Vaccination against swine flu has started in the US and will soon begin in Europe, but many of those who should be first in line are having second thoughts.

Healthcare workers are a top priority for vaccination because they can infect vulnerable people and because their services are vital in a pandemic. Yet in a survey of UK nurses last week, 47 per cent said they would not get vaccinated.
=>https://web.archive.org/web/20091014112322/http://www.nursingtimes.net/whats-new-in-nursing/swine-flu/nurse-confidence-in-swine-flu-vaccine-falling/5006950.article

Meanwhile, British hospital bosses quizzed by *The Guardian* newspaper claim that as few as 10 per cent of staff will have the shot. In the US, many hospital employees are protesting against rules saying they must be vaccinated or lose their jobs.
=> http://www.guardian.co.uk/world/2009/oct/11/swine-flu-pandemic-vaccine-nhs

Children are also at the top of the vaccine list. In the US summer outbreak, the age group most hospitalised was children under 4. Yet 40 per cent of US parents say they won't vaccinate their kids, according to a poll by the University of Michigan.
=> https://web.archive.org/web/20091122202030/http://www.med.umich.edu/mott/npch/pdf/092409report.pdf

Many parents and health workers argue that swine flu is not dangerous enough to justify the potential side effects of a vaccine, but this week there were fresh warnings that the virus can cause serious illness. In Canada and Mexico respectively, 17 per cent and 41 per cent of people admitted to intensive care with the virus have died. In Mexico, half had no underlying health problems; in Canada 70 per cent had no major illness beforehand.

H1N1 Vaccines: Criminal intent? Hawaii on chopping block

Examiner, 13 October 2009, 11:06 PM
https://web.archive.org/web/20100419052828/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m10d13-H1N1-Vaccines-Criminal-intent-Hawaii-on-chopping-block

Contributed by Ray Songtree, Kauai, Hawaii, October 13, 2009

The media plan is to scare people into taking H1N1 vaccines. If there really is an increase in hospitalizations as now claimed by the Center of Disease Control (CDC), then the mild virus that has circled the globe for 6 months has mutated from mild to something more dangerous. If mutated, then the 250 million H1N1 vaccines for USA are obsolete and useless.

=> https://web.archive.org/web/20100416063851/http://www.examiner.com/x-10438-Human-Rights-Examiner~y2009m10d10-Mindbehavior-control-dupes-doctors-and-public-to-buy-vaccine

Which is it? A mild flu that is no big deal, or a new more dangerous strain?

Perhaps we can ask the Hawaii Dept of Health (DOH) officials to clarify whether the vaccines are obsolete or not, and explain their reasoning? Perhaps we can ask whether this H1N1 influenza is like any other seasonal flu, and the whole worldwide pandemic scare is simply a lucrative scam?

New Zealand, South Africa and Mexico

In New Zealand, a nation of 4 million people, only 27 died in a long cold southern hemisphere winter, and all these souls had underlying health complications. Does that sound like a scary emergency 'pandemic'?

According to Secretaría de Salud de Mexico, in a country of 105 million, only 242 people have died in the last 6 months from H1N1 swine flu, again, most with underlying complications.

South Africa with 47 million people had 94 deaths attributed to H1N1 'swine' flu. Following these statistics, in Hawaii, if more than a half dozen people die in the next 6 months, then it is not same world wide virus; it has mutated; and vaccines were a waste to everyone but the drug companies. It is more likely you will die in a car wreck so why take the vaccine?

If we have the original H1N1 flu, will the brand new untested vaccines be effective? They may decrease symptoms, do nothing, or they may cause harm. No one knows.

Baxter International was awarded the first contract to produce the vaccines and Novartis/Baxter got the contract to test them! No independent testing!

Without adequate time for thorough testing, billions of shots are being produced at break neck speed, and the World Health Organization (WHO) via CDC via DOH keeps urging us to take them.

Why?

The answer is the word 'pandemic.' WHO changed the definition recently, just for this alleged H1N1 'swine flu.'

"The old definition was a new virus, which went around quickly, for which you didn't have immunity, and which created a high morbidity and mortality rate. Now the last two have been dropped, and that's how swine flu has been categorized as a pandemic." (Epidemiologist Tom Jefferson, *A Whole Industry Is Waiting For A Pandemic, Part 2: Contradictions between Scientific Findings and Practice*, Interview transcript, Spiegel, June 21, 2009)

Now some workers are being told, "Get vaccinated or lose your job!" Mandatory vaccinating has already started.

When DOH spokesperson says "we have never considered mandatory vaccines," it is an irrelevant statement. DOH no longer has authority according to international law that USA falls under with Level 6 'Pandemic'.

In 2005, 193 member nations agreed to change their laws and give up their sovereign rights to the World Health Organization (WHO) whenever WHO decides to declare Level 6 'Pandemic."

Bush signed these laws without congressional overview or media coverage. Why secrecy?

We are currently under the law of WHO and will be until WHO says the 'emergency' is over. This could be years. (Also see National Security and Homeland Security Preidential Directive)

County Councils are therefore correct to become alarmed at rumors of compulsory shots because it is not a rumor. Everyone should be alarmed.

Receiving completely untested vaccines may no longer be your choice. Your job may depend on getting required shots, or perhaps your travel might be restricted. Sacramento Airport now has a vaccine center and this will go world wide very soon.

How will mandatory shots be enforced? Military, police and health workers will be the first told to take H1N1 vaccine or court martial/fired. They will then "obey orders." Or maybe they will be heroes and will say, "No way!"

Others may say, "It's just a vaccine, I want my job." This ignores the question, "Why did WHO invent a 'pandemic' and then immediately set up a world wide schedule to push untested vaccines through martial law?"
